It remains to indicate the character of the tenancies. A third of the whole tenant cultivation is held by 512,070 holdings with right of occupancy. On two thirds of this area the rents are paid in cash; on the rest the rents are fixed at a share of the produce, which varies, according to locality, from a fifth to a half. The average size of these tenancies with right of occupancy is 6½ acres; the holdings paying cash rents average nearly 6 acres, those paying rent by a share in the produce average 8 acres.

Only 1 per cent. of the whole tenancies are held on written leases.

Tenants-at-will, whose holdings number 1,096,595, cultivate of the whole tenancies a fraction less than two-thirds, viz., 6,488,313 acres. Of this area 43 per cent. pay cash rents, the holdings averaging 5 acres; 27 per cent. pay rents of half produce, the holdings averaging 6 acres; and 30 per cent. pay produce rents pitched at a smaller share than half, the holdings averaging 8½ acres.

The figures of the return give 6 acres as the average size of tenancies of all descriptions. This is not of itself equivalent to saying that a tenant on the average cultivates 6 acres. For in the return one man who holds tenancies under two separate owners would necessarily be counted twice, for he has two distinct tenancies; and, on the other hand, two brothers jointly holding one tenancy, are shown as only one holding. Setting off these two elements of error against each other, we may, I think, accept the result shown in the return, and say that on the average of all classes of tenants the holding is usually 6 acres.

The tenant with right of occupancy cannot be ousted, except by decree of the civil court passed consequent on the failure of the tenant to satisfy promptly a decree for arrears of rent. But if he himself voluntarily deserts his holding, his right of occupancy at once fails.

The tenant-at-will cannot be ousted except at the close of the agricultural year. He is in fact a tenant from year to year; and if he is not served with notice of ouster in due time before the commencement of the agricultural year, he is entitled to hold on for another year.

No useful purpose would be served by my detailing the grounds on which the occupancy rights of tenants have been awarded in the settlement and civil courts. They have not been created by us on abstract grounds of policy, but are the judicial and legislative interpretation of the privileges, which the older tenants possessed in the times immediately antecedent to our rule; an interpretation no doubt open to argument, but none the less the one arrived at by the majority of our revenue officers and judges whose duty it was to decide the matter, who had the best opportunities for doing so, and whose decision has been finally accepted by the Legislature.

The possession of such a right of occupancy has two principal results :—(1) it protects the tenant from ouster; and (2) it protects him from excessive enhancement of rent. A tenant cannot claim a reduction of rent on the ground of his occupancy; but if the owner sues to enhance his rent, the tenant's occupancy right prevents its enhancement to the level paid by tenants-at-will, according to a scale laid down in the Punjab Tenancy Act. The protection thus afforded varies from 50 to 15 per cent. of the full rent, but is only 15 per cent. in the great majority of cases.

How far does the character of the tenure appear to affect the economic condition of the person holding it?

This amounts to an inquiry how far the occupancy tenants are worse off than the owners, and the tenants-at-will than the occupancy tenants. It has to a considerable extent been answered in the replies to question 9. It is obvious and easy to reply that the size of the holdings being equal, in the long run the tenant-at-will must be worse off than the tenant with an occupancy right, and the owner better off than either. But, as a matter of fact, the differences are frequently not so great as we should *primâ facie* expect.

For instance, the appended tenure returns show that of 3,382,598 acres cultivated by occupancy tenants, 1,364,674 acres pay no higher rent than the revenue demand, or that demand plus a small cash seignorage (Malikâna—generally 2 or 3 annas per rupee of revenue).

Again, among these tenants are some of the best and most industrious of the agriculturists.

The truth is, that the character of the tenure, though clearly the most important influence, is not the only effective influence in determining the condition of the tenure holder. Besides the influences of industry and character, a very strong influence is attributable to the past history of the country under previous native governments. Revenue and rent were identical terms; the Government usually, and so far as was practicable, levied the whole rent, and dealt directly with every cultivator, ignoring proprietary privileges. These governments have passed away, but the conceptions which they created in the minds of the agriculturists are of very old standing, and change more slowly. We thus constantly find that where the tenants are a settled body of some standing, whether possessing an occupancy right or not, there is not that sharply defined difference between their welfare and that of the village proprietary which the difference of tenure would lead us to expect. No doubt the owners are rapidly realising the power which our law gives them over their tenants, especially that of enhancing rents. Besides this, our rule has greatly enhanced the power of the owner to borrow money on the security of his holding (a power which existed only to a much more limited extent under native rule); and though the tenant also can now get a larger credit than in former days, still, as compared with the owner, he stands at a great disadvantage in this respect.

Perhaps the incident which of all others gives the strongest effect to the difference between the owner's and tenant's status is the payment of rent by a share of the produce. Such produce rents are usually confined to the division of the grain, but extend occasionally even to the division of the straw. And they almost invariably reduce the tenants who pay them to an economic condition very much below that of adjacent owners with holdings of a similar size, and also distinctly below that of similar tenants paying cash rents. On fertile lands the liability to such rents is often contested by the tenants with periodically recurring bitterness. On dry lands, with uncertain crops, produce rents are not unfrequently preferred. The relative prevalence of cash and kind rents in each division is :—

Are there any conditions of tenure (such, for instance, as unrestricted freedom of transfer) which might be changed with advantage to the holder and without injury to other parties?

In the Punjab there are not. The freedom of transfer which the landowner possesses is materially restricted both (1) by law, and (2) by social feeling.

(1.) Testamentary dispositions of property are almost unknown; and property devolves almost universally by equal division among sons. In respect of transfers *inter vivos*, the law of pre-emption is a powerful obstacle to careless alienations. In the vast majority of transfers this right is not asserted; and a man selling under sufficient necessity and for just purposes is practically little troubled with the claims of pre-emptors. But a spendthrift, or a man acting in opposition to the feeling of the proprietary community of which he is a member, is nearly certain to find an ill-considered sale met by assertions of the right of pre-emption on the part of his village coparceners; the result being that he may succeed in parting with his land, but he will part with it not to strangers, but to other members of the same community. Occupancy tenants of the most privileged classes are permitted by the Tenancy Act (sec. 34) to sell their right of occupancy, provided local custom (sec. 2 of the Act) does not distinctly deny them this power; but they must in every case first offer their right at a fair price to the landowner. The landowner's feelings are usually strongly opposed to such sales; which are consequently few in number.

(2.) The influence of social feeling in restricting transfers is even stronger than the laws above described. It is universally esteemed utter disgrace to a man to part with his ancestral land; and, constituted as their society is, such a man has little or no chance of substituting any respectable calling for his ancestral livelihood. So that landholders throughout the Province will endure all possible straits before finally parting with their heritage.

Some further remarks on this subject will be found in the reply to question 14 of this chapter.

Statistics of Land Tenures in the Punjab.

The following is a summary of the tenures:—

Superior Tenures.	Number.	Area in acres.
Zamíndári estates held by individuals or families - - - -	1,695	26,90,994
Village communities paying in common	3,392	27,78,920
Village communities divided upon ancestral or customary shares subject to the law of inheritance - -	4,088	46,00,559
Village communities in which possession is the measure of the right in all lands - - - -	8,568	1,50,36,578
Village communities in which the lands are held partly in severalty and partly in common - - - -	16,972	2,58,61,787
Grantees or lessees of British Government - - - -	1,584	17,72,342
Landholders who have redeemed the revenue - - - -	63	51,001
Purchasers of Government waste land -	64	17,078
Government waste unassigned - -	—	1,02,16,872
Total - - -	37,659	63,026,123

Inferior Tenures.	Number.	Average area of holding.		
		A.	R.	P.
With right of occupancy paying rent in cash at different amounts (a detail of which will be found in the statement)	3,69,849	5	3	13
Ditto ditto, paying rent in kind ditto ditto - - -	1,42,221	8	1	4
Tenants holding conditionally - -	28,417	6	2	17
Tenants-at-will { Paying in cash -	5,70,352	5	4	10
Tenants-at-will { Paying in kind -	5,26,238	7	0	5
Holders of service grants cultivating the land so held - - -	40,409	1	3	2
Total - - -	1,677,486	6	0	4

The following general facts may be deduced from this statement. Of the total area of the Province, 16 per cent., and of the cultivated area, 44 per cent., is held by tenants. This fully bears out the statement which has often been made that the land is held largely by cultivating proprietors. This is a point which greatly affects all questions of revenue administration, and cannot be too prominently noticed. The number of tenants with right of occupancy amount to 30 per cent. of the total number. The majority (about 72 per cent.) of tenants with right of occupancy pay rent in cash; 52 per cent. of tenants-at-will pay cash rents. The average area of holdings of tenants who pay in cash is a little more than 5 acres; that of tenants paying rent in kind is larger.

---

* The figures of the Jhang district have been omitted, as they seem to be wrong.

NORTH-WESTERN PROVINCES AND OUDH.

North-Western Provinc. and Oud.

Mr. Ellic and Mr. B

The oldest form of proprietary tenure found among the village communities of the North-Western Provinces is the bhaiachara. The essence of this tenure, is, that the division of the land is based not according to ancestral right, by which each member or cluster of members owns a share resting on his relation to the common forefather and his position on the genealogical tree, but it is based on actual facts, each member of the brotherhood taking that portion which at the moment of crystallisation he actually holds; so that the stronger members got a larger, the weaker a smaller share. Where the division is minute, as it generally is (since such communities have always been on the land for many generations), a certain number of representatives called lambardars are elected, who collect from each sharer his quota of the land-revenue and pay it into Government. All are mutually responsible for the revenue; that is, if any sharer falls into arrears, the rest are liable to have it collected from them, and must take their own measures to recover from the defaulter.

All other tenures are more recent in their origin, the mode of division indicating that the proprietary body have not yet forgotten their common ancestor or lost their family feeling, but divide their estate according to ancestral shares. There are two forms of such division—complete and incomplete, or, as they are called, perfect and imperfect.

3. When such a body of proprietors cannot any longer agree to act together or to accept the common headship of one representative, they generally proceed

Chap. I. Qn. 10.

North-Western Provinces and Oudh.

Mr. Elliott and Mr. Buck.

to a division. In former times they usually divided the cultivated land only, leaving the fallow waste in common; and this is called an "imperfect partition." Each shareholder, or each set of shareholders who still agree to hold in common, pays a share of the revenue proportionate to the share of cultivated land that has fallen to him or it. By degrees the fallow land is broken up and cultivated, and the rent received from it is generally taken in the first place to pay the revenue, the remainder only being distributed among the owners of the separate shares.

4. This, however, implies some remnant of communal action; and when party-feuds are bitter, the shareholders cannot agree as to the management of the undivided land, and the collection of rents from those who cultivate it. In this case they proceed to a "perfect partition," the whole of the village lands being divided, whether cultivated or waste. Each share or patti bears its portion of the revenue; and if the owner or owners of one patti fall into arrears, the other pattis are not responsible, and their owners can only be called on to pay up if they agree to take over the management of the defaulting patti for a term of years.

5. As all communal life leads to quarrels and feuds (especially in peaceful times, when the village community no longer have to maintain their existence by the sword), the undivided village tenure is necessarily the most recent in its origin, and is ordinarily not more than three or four generations old. This is known as the "zamindari tenure," in which there is no division of land, profits being divided among the owners according to the arithmetical fraction ($\frac{1}{2}$, $\frac{1}{4}$, &c.) of the share which each holds, after payment of revenue and common expenses. Ordinarily speaking, one man acts as the representative of the proprietors, collects all the rents from the tenants, pays the Government revenue and other charges, and distributes the profits. If the proprietors themselves cultivate land, a light nominal rental is written against it; and when the accounts are made up, it is assumed that each has already received that sum towards his share of profits.

6. These tenures, as will be easily understood, melt imperceptibly into each other. In bhaiachara estates there was sometimes at the time of partition a portion of land left undivided, so that they might be classified as perfect and imperfect bhaiacharas. In such cases the division of the common land is fraught with many difficulties; and if new land is taken into cultivation there is sometimes a new arrangement of rates, leaving possession of the new land to the proprietor who has taken it instead of new distribution of land. In all kinds of divided tenures the owners of any share or patti may hold it among themselves undivided on the zamindari tenure, or may subdivide it completely or incompletely. It would be easy to conceive that every kind of tenure might co-exist in a large bhaiachara village.

7. As time goes on, the shareholders multiply and crowd on the original soil; feuds and quarrels spring up; new purchasers get in who have no interest in common with the old owners; common land is broken up and rented; and from all these causes a process of differentiation goes on, and partition is called for. This takes the form of—

(1.) Conversion of zamindari estates into imperfect pattidari estates;

(2.) Conversion of zamindari or imperfect pattidari into pattidari estates; or

(3.) Complete separation of all rights and interests, and conversion of the share or patti into a new and distinct estate.

8. This right of partition carries with it undoubted advantages. It enables a shareholder to escape from the frauds and oppressions of an astute or overbearing lambardar, or the encroachments of a money-lending purchaser. It limits his liabilities, and defines his rights. It is in harmony with the general process of individualisation which is going on, and which civilisation and law encourage. But that very process entails social and administrative evils of the gravest character. The unlimited right of partition encourages the multiplication of numbers which may tread too closely on the productive power of the soil. There is no stimulus to instigate the younger son to go out into the world, to adopt a profession, or to emigrate, if he can always claim to divide off his inherited share in the paternal acres and to enjoy them as his sole property. From an administrative point of view, the multiplication of numerous properties from which the revenue has to be collected separately is a great evil. If they are distinct estates, the task of collection falls on the Government establishment, which must be strengthened. If they are only distinct shares in an estate, the task falls on the lambardar; and Mr. Alexander (Moradabad) has pointed out how great an evil this intricate subdivision is; and he mentions that in some parts to appoint a man lambardar is considered equal to fining him Rs. 200. He proposes, as a remedy, to limit the number of zamindars, *i.e.*, that Government should refuse to recognise any subdivision of land, or of rights in land, below a certain minimum area. It is likely that, as the Deputy Commissioner of Kheri notices, the smaller the proprietor becomes, the harder he presses on his tenants. There is no doubt that the cost of collection to Government will become seriously greater as the process continues; and such has been found to be the case in some of the permanently settled tracts where subdivisions have been excessive.

9. It is an evil from an agricultural point of view that the land of each holder should be broken up and separated (for, even if the proprietor does not cultivate himself he has to give his tenants broken holdings), and it would be a great advantage to distribute cultivators' holdings as far as possible by blocks. It has been advocated that the rules under the partition law should make it understood that inability to divide an estate into compact blocks will bar partition, and that the power which is given by the law to the highest revenue court of appeal to disallow partition on this ground should be more strictly exercised by the lower courts except in special cases. The number of partition cases before the revenue courts in 1876–77 was between 4,000 and 5,000.

10. Other proprietary tenures may now be noticed, which arise from difference of circumstances as to the payment of revenue.

Revenue-free estates are held by possessors of valid grants made under native rule. A large number of grants were assessed some years ago as invalid, and the estimated revenue of those still free of all revenue demand is Rs. 1,08,727.

Nazarána estates, in which a fixed sum (nazarána) is paid "representing the tribute which revenue-free "holders paid to the amils (Muhammadan revenue-"collectors or governors) to secure their favour" (Moradabad reply). These estates are found only in the Meerut and Rohilkhand divisions.

Quit-rent holdings are few, having an estimated revenue of Rs. 7,697 only.

Ubári estates are those estates in the Jhansi division of which a fixed portion of the revenue is remitted.

Fee simple estates are those in which grantees have been allowed, under a law now obsolete, to buy up or redeem land-revenue; they occur in the Sub-Himalayan and hill tracts.

The following is an abstract of the remitted revenue (*i.e.*, of the revenue estimated as lost to Government):—

—	Nazarána holdings.	Quit-rent holdings.	Ubárí tenures.	Lands wholly revenue-free.	Fee-simple estates.
	Rs.	Rs.	Rs.	Rs.	Rs.
1876–77 - -	25,623	7,270	5,524	1,08,727	1,147
1875–76 - -	26,719	3,646	5,149	1,07,465	1,141

NORTH-WESTERN PROVINCES AND OUDH.

Mr. Elliott and Mr. Buck.

11. The above tenures belong to the North-Western Provinces. Circumstances are somewhat different in Oudh, because a different evolution has followed a different history. At the beginning of the century the conditions of the two Provinces were similar. There were in the North-Western Provinces (when ceded) two classes of large revenue-payers both known as "talukdars." Of these, one class were the heads or the representative men of clans or large brotherhoods; the others were court-favourites, revenue-collectors or contractors. They were treated in various ways by the British Government. Generally they were allowed malikána (or seigniorage); occasionally they were vested with full proprietary rights, to the exclusion of all subordinate rights; and sometimes were not acknowledged at all, but ousted as usurpers, the subordinate proprietors being alone recognised. The result at the present date is, that in a few cases only the existence of a malikána payment (limited to 10 per cent. on the old revenue) still gives evidence of the former existence of a dual right.

12. The talukdars of Oudh have, on the contrary, been allowed to retain their superior rights, although in 1800 they probably were on the same level as the large revenue-payers of the North-Western Provinces. But before Oudh came into our hands the claims of the sub-proprietors were better understood, so that the superior revenue-payers did not in Oudh, as they did so often in the North-Western Provinces, obscure the position and take the place of the inferior holders, while at the same time their own claim to a superior right was admitted.

13. The manner in which the Oudh talukdars have acquired their position, and the nature of the subordinate rights which the law has recognised as existing under the talukdar, are described in the following remarks of Mr. Woodburn, Deputy Commissioner of Faizabad:—

"The history of these estates (talukdars' estates), their origin and growth, is a familiar debating ground in Indian politics. The district illustrates every variety of them. In one of its talukas the landlord is even now a merely nominal chieftain, *primus inter pares*, the nucleus to an agglomeration of clansmen. In another he is the hereditary head of an ancient *sept*, supreme in his family dignity, and almost unfettered in his proprietary privileges. A third estate has slowly been accumulated by the successive members of a careful and respectable family. The largest of all was founded by a brilliant adventurer, and built up with the aid of official influence by a far-seeing and unscrupulous successor.

"In the lands of every talukdar there exist, in more or less degree, sub-proprietary rights. They are of various kinds, both in origin and in value.

"The strongest and most valuable of these is known as a 'sub-settlement.' The lands of a sub-settlement are ordinarily one or more entire villages, the property, as a rule, of one of those peasant communities which elsewhere hold an independent position. The owners, whether for the protection of their lands or to secure a lighter revenue demand, sometimes at their own instance, sometimes under pressure, had included their estate in the revenue engagement of a powerful neighbour; or their lands had always recognised the feudal superiority of the chief of the clan, or grants to cadets of the leading-house had been divided to the growing generations in continuous subordination to the parent race. The feudal relationship we found at annexation has been maintained. The owners are under-proprietors of their estates. They pay to the baron the revenue assessed upon their lands, with a per-centage, which varies according to the amount of their former rents from 10 to 50 per cent. More than a third of the taluka villages are held on this tenure.

"In taluka villages which have been purchased from the old proprietors, or in which their rights have been depressed to a lower tenure than sub-settlement, the former owners have received almost everywhere provision of some sort in the assignment of an under-proprietary right in the fields of their cultivating occupancy, rent free or at a privileged rate of rent. The latest returns report the number of sír-holders to be 3,290, with an occupancy of 21,878 acres, at a decreed rent of Rs. 47,585.

"In some instances the privileges and perquisites of the original owner had been so pressed out, that in the maintenance of the *status quo* which was the principle of the Oudh settlement there was found for them no place for favour. Cases of this sort were to a certain extent arranged for by the provisions of section 5 of the Rent Act. Owners of the soil who held their lands in independent tenure down to 30 years before the annexation are confirmed in the occupancy of the fields they held at the close of native rule at a rent 12½ per cent. below the rents ruling for similar lands. Two thousand five hundred and six persons have received decrees for occupancy rights in an area of 7,032 acres.

"These may be called 'hereditary rights.' There are, besides these, acquired subordinate rights of great extent common to both talukas and the estates of zamindari communities.

"Grants of birt and shankalap (rent-free grants) are everywhere common. These are sometimes purely religious grants. They are more commonly secular assignments thinly veiled in a religious form. It is almost invariably the form in which a landlord gives a plot of waste to a small capitalist to bring under cultivation. The district is peculiar for the remarkable number of small hamlets which break the stretches of plain between the regular villages, each hamlet a fresh centre of cultivation and verdure. They are almost always the settlements of shankalapdars. Sometimes they paid money for the allotment; but they invariably got a formal conveyance, fixing the rent to be paid on the cleared lands.

"In the south of this district there is another common sub-tenure known as biswi. It is a mortgage of cultivated lands at a rent which is as much lower than the full rent as the yearly interest of the mortgage money. In many cases the transactions are of very old date, and the relationship has become confirmed under the rules of limitation.

"Under these conveyances nearly 6,000 tenures have been settled by decree. They cover an area of 39,547 acres.

"The holders of these acquired subordinate tenures seem to inherit the prudence under which they were farmed. They are rarely in difficulties. The owners of the ancestral sub-tenures, on the other hand, are very commonly embarrassed, sometimes very gravely so. In the case of sub-settlements this is not surprising. They are held and managed by the same classes as in independent villages. In the latter the owners are not supposed by Government to be able to pay more than half the net assets. In the sub-settlements they have often to pay three-fourths. It is only a rigidly methodical and punctual system that can save them from difficulty. This they have but seldom had the courage to give themselves. It is only within the last two years that the law has furnished any effectual means of ensuring the punctual payment of sub-settlement rents; and the earlier period in which they were left almost to their own wishes has loaded them with a rent debt which must be in unfortunately numerous cases ruinous.

"It would have been happier probably for all parties if these sub-settlement holders, owners of the soil, but, in fact, in the course of events now middlemen, had been reduced at once to the position of sír-holders, giving them exceptionally favourable terms of occupancy. It would have broken certainly the principle of the *status quo*; but it would have been a step quite familiar to the rough practices of the nawabi, and, taken at the first, would have been quietly accepted. It is the point to which they are now gradually drifting."

14. The agricultural statistics of the Province are not yet in a sufficiently forward condition to return the total number of proprietors in each class, but the following statement shows approximately how the cul-

Chap. I. Qn. 10.

North-Western Provinces and Oudh.

Mr. Elliott and Mr. Buck.

tivated area is distributed between the different classes. It is an abridgement of Statement No. I., which will be found at the end of this reply :—

Holders of Superior Tenures.	N. W. P.	Oudh.
Talukdárs	3 per cent.	59 per cent.
Undivided communities	39 „	16 „
Divided „	51 „	20 „
Revenue free estates	4 „	2 „
Others	3 „	3 „

15. Land subject to different cultivating rights may be classed as follows :—

(1) land held as sír :
(2) land held by zamindars as tenants other than sír :
(3) land held by tenants at fixed rates :
(4) land held by privileged tenants :
(5) land held by occupancy tenants :
(6) land held by tenants at will :
(7) rent free land held—
  (*a*) as a grant by the landlord ;
  (*b*) in lieu of wages.

(1.) *Sír* is defined in Act XIX. of 1873 to be the land recognised by village custom as the special holding of a co-sharer, and corresponds (to compare small things with large) to the home farm of an English proprietor. In this land no occupancy rights can accrue to any one to whom it is let for purposes of cultivation. It is generally valued in the village accounts at a very low rate of nominal rent ; and, on account of the privileges thus attaching to it, a shareholder in a divided village is not allowed to include more land in his sír than a certain quantity fixed in former years.

(2.) *Land held by zemindars as tenants other than Sír.*—There is nothing to prevent any proprietor from cultivating any area in excess of his sír that may be available, but he must then take it on the same terms as any other tenant. Resident proprietary families of which the members are numerous occasionally are found to cultivate a good deal of land in this way as ordinary tenants, and, until the late revision of settlement occurred, there was not a little difficulty in separating it from sír land proper.

(3.) *Tenants at fixed rates.*—In the permanently settled districts cultivators who have held their land continuously for more than 20 years are presumed, in default of proof to the contrary, to have held it since the permanent settlement was made (in 1790), and to be entitled to the same benefits as were then conferred on the landlords ; *i.e.*, they have a right to sit at fixed rates, and cannot have their rental enhanced. This is the only cultivating tenure which is legally transferable.

(4.) *Privileged tenants* are "ex-proprietors," who, after their proprietary rights have been sold, are, under the present law, allowed to hold what was their sír land on favourable terms, viz., at a rent of 25 per cent. less than ordinary tenants.

(5.) *Occupancy tenants*—those who have cultivated continuously for twelve years.

They cannot be ousted, except by order of a court on account of non-payment of rent, and cannot have their rents enhanced, except by decree of a rent court ; and then only up to the prevailing rate paid by similar land in the neighbourhood.

(6.) *Tenants at will* can be ousted at the end of the agricultural year, and can be rack-rented at the pleasure of the landlord.

(7.) "*Holders of grants*" are either relatives of the proprietors or religious members of the community who have been given a plot of land, free of rent, by the proprietors. They include the *shankalapdars* or *birtdars* of Oudh mentioned by Mr. Woodburn.

Those who hold "in lieu of wages" are village servants, *e.g.*, watchmen, sweepers, &c.

16. The agricultural statistics are not yet compiled with sufficient fullness to be able to state the number of the different classes of cultivators, or the area they hold, nor does any record at all exist regarding the tenants at fixed rates in the permanently settled districts, the privileged tenants, nor the holders of rent free land ; the numbers of these classes however are small. The following information has been supplied to show approximately in the North-Western Provinces the per-centage of cultivated area held by the three main classes of cultivators. The statement from which it is abridged (No. II.) will be found at the end of this reply.

Cultivated by the zamindars	26·5 per cent.
„ tenants with occupancy and other rights	41·7 „
„ tenants at will	31·8 „

17. The following further statistics have been collected from settlement reports to show as far as dossible the numbers of persons belonging to these classes, and the area they cultivate :—

18. Hardly any suggestions have been made by the district officers as to any alterations than can be made with advantage in the conditions of tenures, and very few officers have paid any attention at all to this subject. Mr. Alexander's proposal for restricting subdivisions has already been referred to. Mr. Dale (Mirzapur) points out that, when a transferable cultivating tenure is sold to a money-lender or other non-agriculturist, the purchaser becomes a middleman who pockets and lives on the difference between the protected rent he pays and the rack-rent he extorts, and he desires to make such sales impossible by declaring a cultivating tenure forfeited if the holder does not cultivate. A proposal has been made by Messrs. Elliott and Buck (but it is disapproved by the Board of Revenue) to curtail the frequency of enhancement suits, and to enable tenants at will to secure the rights of a higher class of cultivator by purchase. All these topics will be more fully discussed under the head of Chapter III. of the Report.

BENGAL.

BENGAL.

Mr. Toynbe

Land Tenures, &c.—The following account of the land tenures of Bengal, taken almost *verbatim* from a memorandum by the late Mr. McNeile, C.S., will explain generally the state of affairs existing in the Lower Provinces.

The decennial settlement of Bengal and Behar, commenced in 1789, and completed in 1790–91, was declared to be permanent in 1793. The zamindars, with whom the settlement was originally made, were powerful chiefs, holding vast tracts of country, of which by the settlement they were constituted *proprietors*. Owing to the unbending character of the Government demand, which could not be enforced against tenants with equal rigour, these large estates were speedily broken up and subdivided into a large number of smaller ones, the purchasers of which succeeded to the proprietary rights of the original holders. The only condition of continuance of this proprietary right was the punctual payment of the Government demand. The zamindars, as the proprietors are called, seeing how the Government had escaped all the labour and risks attendant on detailed mofussil management, were not slow to follow the example set them. They disposed of their estates in a similar manner by creating permanent under-tenures called *patni* tenures, extensive tracts being leased out in this way on long terms. By the year 1819 these alienations had become so common that they were formally recognised by Regulation VIII. of that year. The practice of creating these under-tenures was steadily continued until the present day, when but a small proportion of the whole permanently settled area of Bengal remains in the direct possession of the zamindars. In making these alienations, or in letting their lands out in farm, the zamindars exact a bonus and obtain far better terms than the Government originally got from them.

The process of sub-infeudation described above has not terminated with the patnidars and ijaradars. Darpatnis and darijaras, and even further subordinate tenures, have been created in great numbers (*vide* annexure). These tenures and under-tenures often comprise defined tracts of land; but the more common practice has been to sublet certain aliquot shares of the whole superior tenure, the consequence of which is, that the tenants in any particular village of an estate now very usually pay their rents to two, or many more than two, different masters so many annas in the rupee to each. Some few similar under-tenures which existed before the permanent settlement were then recognised as such, or have been since confirmed by lapse of time. In addition to these tenures, the country is dotted over with small plots of land held revenue-free, the large majority of them having been granted by former Governments, or zemindars under those Governments, as religious endowments—grants which have since been recognised and confirmed by the English Government.

Of the ryots who actually till the soil there are three classes—

1.—Those having permanent holdings at fixed rents;
2.—Those having rights of occupancy but liable to have their rents raised on certain grounds laid down by law; and
3.—Tenants-at-will.

The tendency of the proprietors and tenure-holders of Bengal has been to reduce as far as possible the area held by ryots of the first two classes, and to convert them into those of the third. In Eastern Bengal the process of sub-infeudation has created a large class of petty cultivating proprietors, and as a rule the ryots of those parts are well able to hold their own. But in Northern Bengal, and especially in Behar, the system of creating under-tenures, and giving out estates to farm on short lease, has had the effect of reducing the peasantry to a state of hand-to-mouth existence, which has long called for legislative interference.

The economic effect of the various processes above described has been this. As stated in the answer to question 13, the road cess returns show that the gross rental of the land in Lower Bengal is now nearly four times as large as the Government revenue due from it. Since the time of the permanent settlement of Bengal, two concurrent processes have been at work to produce their joint effect, viz., the extension of cultivation and the fall in the value of money. As to the latter, this value being a relative quantity, it is difficult to gauge its fluctuations with accuracy, but, on the whole, there can be no doubt that less than 50 per cent. will not adequately represent the amount of the fall during the last eighty years. It is an obvious reflection that this has halved the value of the Government revenue assessed on the Lower Provinces in 1793. Who has

HAP. I. QN. 10.

BENGAL

Mr. Toynbee.

reaped the benefit of this increase? The zamindars have obtained a portion of the profits, perhaps a considerable portion; but they have excluded themselves by the creation of permanent under-tenures from a large share of the prospective augmentation of the rental of their estates. The same observation applies to under-tenants who have adopted the same course. The ryots, however, though there can be no doubt that their position has on the whole greatly improved and that the money value of the wages of labour and the profits of small proprietors have largely increased, are yet still, as a rule, in the position of living from hand to mouth, and have no accumulated resources to fall back upon in times of scarcity and distress, though in the eastern districts they are year by year becoming comparatively independent of money-lenders. The traders and money-lenders are beyond all question the classes who have secured the mass of the increased wealth of the country. It is not too much to say that they have amassed such riches and such influence as to become the most powerful class in the community. They very often invest their gains in landed property, and thus supply new blood to the old landholding classes. But while they bring fresh energy and intelligence to bear upon the development of the resources of their properties, they are harder on their tenants than the original proprietors were. The best available figured information bearing on the Commission's 10th question appears to be contained in the printed statistics compiled for each district from the records of the Road Cess Department. Even in these the area covered by each tenure, or class of tenures, is not given. It is probably in most cases quite unknown to the zamindar himself; so great has been the extent of the sub-infeudation and sub-division of tenures in some parts of Bengal during the last century. Without a cadastral survey, accompanied by such detailed field to field statistical inquiries as form a part of settlement proceedings, it is impossible to give for Bengal, with any degree of statistical accuracy, the information asked for in question 10. As some index and test of the comparative wealth and position of the various tenure-holders and ryots, the figures in the statement on the following page have been prepared from the road cess papers above referred to. It will be observed how large a proportion of the ryotee holdings pay a rental of between Rs. 5 and Rs. 20 per annum, and how much larger a proportion pay less than Rs. 5. The figures given under the head of ryotee holdings will not accurately represent the number of individual ryots, for many of them hold land in more than one estate, under more than one landlord, and would under such circumstances have been counted more than once in the returns. The returns which the Road Cess Law required only provided that the number of ryots and the amount of rent paid by each should be shown in the returns due from each estate. There was no obligation on the landholder to state the area or the number of plots held by each ryot. Still, for comparative purposes, the figures are valuable and show in a remarkable manner how the increased pressure of the population on the soil tends more and more to create petty holdings and break up large ones. Columns 16 to 19 show the extent to which sub-infeudation has been carried on in Bengal.

It may be safely assumed that those ryots who pay less than Rs. 5 per annum for their holding, supplement their resources by service or by labour of some kind, whether at home, or in the fields, or on public and private works. They would in time of famine or scarcity be the next, after the purely landless classes, to resort to such works as were opened by the State. Ryots paying between Rs. 5 and Rs. 20 would, as a rule, be more or less dependent on State help according to the circumstances of the season, and the severity of the failure of crop. All those paying over Rs. 20 may be fairly said to be able to take care of themselves, but they, as will be seen from the figures, form but a very small part of the whole.

The only change in conditions of tenure, which it would apparently be feasible and advantageous to make at present, is that which has been recently proposed, viz., to make the occupancy ryots' tenure generally transferable *by law* to other cultivating ryots. As a matter of fact, the transferable character of these tenures has been affirmed by local custom in very many districts simply as an occupancy tenure, and the landlord has the same remedies against the new tenant, and the same powers of enhancement, that he had against the old. It is believed that the general recognition by law of the transferability of the occupancy tenure would have no injurious effect upon the position of the zamindars, while it would certainly tend to improve the condition of their tenantry, and to give them a greater interest in the improvement of their lands. Nothing could be better calculated to improve the system of cultivation, and the value of an estate, than permanency and security of the ryots' tenure. If after securing by law transferability of tenure to the occupancy ryot (a right which he already possesses by custom in many parts of the country) provision were made in the law to prevent him from converting himself into a mere middleman, or transferring to non-cultivating holders, and for strictly regulating the character of the sub-letting to which an occupancy ryot must limit himself, it would seem that a great improvement would be effected in the law of tenant right in Bengal, such as would tend to raise the value of property and increase the landlord's security for his rent.

STATEMENT showing the ECONOMIC CONDITION of BENGAL with regard to Estates, Tenures, and Holdings of different Values.

Note.—In the road cess valuations, estates with a revenue not exceeding Rs. 100 and revenue-free estates admitted of summary valuation. When thus valued, if the proprietors accepted the valuation no returns were received, and consequently no detailed information of the kind given above was obtained. Hence on a rough average the figures given in columns 6 to 11 only embrace about three-fourths of the entire area under cultivation. Similarly the figures in columns 12 to 19 will not be perfectly complete, though there is no reason to doubt the correctness of the proportions.

* The Road Cess Act is not in force in these districts.

† The returns from these districts have not yet been received.

In the following districts sub-infeudation goes beyond the fourth degree, viz., 24-Pergunnah and Jessore have each 14 sub-tenures of the fifth degree, Backergunge 572 of the fifth, 176 of the sixth, and eleven of the seventh. Hazareebagh has three of the fifth degree.

CENTRAL PROVINCES.

I.—The proprietary tenures are those of—

A.	Zamindars, Jagirdars,	Chieftains holding large, hilly, compact tracts.	
B.	Talukdars, Superior proprietors,	More or less pensioners on the land.	
C.	Malguzars, Inferior proprietors, Patels, Gouteahs,	Owners and headmen of villages.	
D.	Maafidars, Mokassadars,	Assignees of full Government revenue in mahals.	General term used in the Nagpur Province.
E.	Ubaridars, Maktadars,	Assignees of part of the Government revenue in mahals, or quit-rent proprietors.	Saugor and Nerbudda term. Nagpur Province term.

F. Malik Makbuzas, proprietors of a division of a mauzah, or proprietors of their own holdings.

The maafidar of a field is the proprietor of his holding, and also the assignee of the Government revenue assessed on such field.

II.—The occupancy tenures are—

G. Absolute occupancy ryots.
H. Occupancy ryots.
J. Tenants-at-will.
K. Service holders.

The malguzari or proprietary rights were conferred on single individuals, or on the headman of undivided families, on the sharers of a divided family, or in pattidari estates, on representatives of the shareholding families, in the few Byachara villages, on the proprietary community.

The Zemindars and Jaghirdars are chieftains, holding large compact estates, formerly granted as feudal holdings. The revenue demand to be paid by them is fixed for their whole estate at easy rates, and not with reference to the amount of rent derived by them from each individual village. These are found mostly in the Chhattisgarh division, Chanda, Bhandara, and Balaghat, and the Jaghirdars in Chhindwara.

In some of their villages inferior proprietary rights have been bestowed on relatives of the chief or on headmen of villages on account of special grants, long possession, or for having brought the village into cultivation. Such inferior proprietors are in most respects equal to malguzars, paying their fixed quotas to the Zamindar instead of paying to Government.

Talukdars are in a position of less dignity, and their lands are often scattered; each individual village has been settled, and the total amount which they pay has been calculated on the assessments of separate villages.

In these estates the Talukdar is for some villages the sole proprietor, or malguzar, and is only called by the higher title out of compliment; but in many villages inferior proprietary rights have been conferred on the headmen, as in the case of Zamindari estates. The sub-settlement provides what amount is to be paid to the Talukdar, and this varies from 10 to 50 per cent. above the fixed Government demand payable by the Talukdar into the treasury. In a few cases the settlement was made direct with the sub-proprietors, who pay into the treasury the Government demand plus malikana, which last is paid from the treasury to the Talukdar, or, as he is sometimes called in Chhattisgarh, the Tahutdar. The superior proprietors are, for single villages, the persons with whom the settlement has been made, there being an inferior proprietor who pays to the superior proprietor the village jama plus malikana, the former of which the superior proprietor pays into the Government treasury. The superior proprietor is, in fact, for a single village, in the same position as the Talukdar stands towards his villages in which inferior rights have also been acknowledged.

This superior proprietor is a pensioner on the land, the inferior proprietor being the village manager.

The superior proprietor of a Talukdari estate is something more than this, as Government has the security of his whole taluk or estate for the payment of the jama of each village.

Inferior proprietors have been described above. Generally they are in the same position as malguzars, but instead of paying to Government, where the settlement is not made direct with them, they pay to the Zamindar, Talukdar, or other superior proprietor the Government revenue demand, plus malikana. In other words, they divide the profits with the superior proprietor, but the amount the superior thus receives has been fixed at a certain sum under the terms of the settlement.

The introduction of the malguzari settlement, borrowed from the north-west, commenced in 1854. Proprietary rights were conferred on such person or persons or cultivating communities as appeared from ancestral right or long possession, or both, to possess the best claims. Such properties were made subject to all the incidents of real property, and could be sold for arrears of rent, for debt, at the pleasure of the owner, or could be mortgaged, or given away, or, under due safeguards, partitioned.

"Malik Makbuzas" are the owners of holdings less than a full village, that is, divisions of a village; they represent the Junadars, the Kadimi Kastkars, the Watandars, the descendants of ousted Patels of the original founders of the village and the holders of resumed rent-free plots, and the like. For convenience the revenue is not collected from them direct, but they pay their assessed revenue quota to the Malguzar of the village in which the holdings lie, plus cesses (if the holding be assessed at more than 10 rupees) plus Haq-ul-tahsil, that is, a per-centage enjoyed by the Malguzar for his trouble of collection and his responsibility to Government for this item of revenue. This is also supposed to cover the Malik Makbuza's share of the common village expenses.

A Maafidar is simply an assignee of the Government revenue, whether it be of a whole village or of a share of a village or of a rent-free plot, such as is above described as the property of a Malik Makbuza. He is often the proprietor of the whole village.

Properly speaking a Mukassadar (a Nagpur term) is a Maafidar.

A Maktadar (a Nagpur term corresponding to the Ubaridar of the Saugor and Nerbudda territory) pays a quit-rent. That is, he pays something less to Government than what is the full Malguzari assessment on the village, or in the case of Ubaridars, sometimes on the group of villages belonging to one owner. It is a privileged tenure. Generally on the death of an incumbent the estate is brought on to full rates or to a higher rate. He is the assignee of a portion of the Government revenue demand. These tenures have an historical and political basis.

In Nimar and Chanda the Patel is the substitute of the Malguzar, being the village headman, but his rights in respect of raising rents, in the management of the waste lands, and of obtaining partition are restricted for the term of settlement.

In Sambalpur, the Gaonteah is similar to the Malguzar; he retains for his trouble and responsibility, free of revenue, his bograh or sir lands, worth about one-fifth of what would be the full revenue on the full village cultivation. He annually distributes the fields and their respective revenue burdens among the ryots, if the custom of the village requires it, otherwise he merely re-apportions the revenue demands. If he cultivates more land than his bograh, he has to assess his excess equally with the lands of the cultivators. His position is clearly shown in the following extracts from Lieutenant Birch's report in 1857, which form the basis of our present summary settlement:—

"The Gaonteahs or headmen of villages are a description of middlemen holding 814½ villages and 445 hamlets. Their duty is to attend to the improvement and cultivation of the village lands, to apportion the Government demand, and to collect the rents from the ryots. They are required to furnish information of all crimes committed within their boundaries, and to assist the police not only in apprehending but in conveying offenders to the Sadar station. They are also expected to apprehend all criminals discovered in the act of committing crime, and are bound to keep up all established roads, bunds, &c. They are permitted to hold a certain amount of land in each village, called bhogra land, rent-free, and they are held liable in person and property for the Government demand from the villages included in their leases.

"The lands held rent-free by the Gaonteahs are considered sufficient remuneration for the performance of the duties imposed on them. They are not permitted to exact from their ryots any more than the Government demand, nor can they oust any of them without showing good cause for doing so; but they are left to make their own arrangements with the ryots, and generally their settlements are made after either of the two following modes, either the lands are divided amongst the ryots in such a manner as that each portion shall contain the same relative proportion of the different qualities of land as is contained in the whole village, or else the ryoti lands are divided into equal parts; each part is assessed at the same amount; each ryot takes one, two, or more portions, according to his means, and the Gaonteah risks any loss that may befall him from the inferior lands not being taken. The former method is more general, but the latter principally prevails in pergannas Chunderpore and Booteeah, where the surface of the country is usually level and the difference in the quantity of land very slight."

The occupancy tenures are: first, those of absolute occupancy ryots. These are the ryots, (1) whose previous possession carried with it something of an hereditary character; (2) who had expended such capital on their fields as to give them some special title; (3) who are relations of present Malguzars or former Patels, and whose occupancy right might be considered to some extent as a substitute for a share in the proprietary right in the village; (4) ryots of new villages who had held their fields since the village was founded, or since their fields had been reclaimed from the jungle; (5) those who had held their fields from a date antecedent to this proprietor's connexion with the village as its landlord; (6) ryots cultivating lands which had descended to them by inheritance, provided that the possession, either by themselves and some other persons from whom they inherited, had lasted continuously for not less than 20 years; (7) ryots* of villages in which the Malguzar was an absentee, and had held under 20 years, and, in the Zamindaris, ryots who had held continuously for 12 years and upwards.

The chief features of the absolute occupancy tenure are:—

1. That all ryots recorded in the settlement misl as possessed of an absolute right of occupancy shall continue for the term of the present settlement to pay rent at the rates specified in the settlement record, and shall not during the currency of such settlement be liable to enhancement of rent or to payment of any cesses or fees, other than those leviable by common consent and village custom from all ryots.†

2. That fixity of rent for term of settlement liable only to revision at recurrence of regular settlements from time to time hereafter is to be a permanent incident and a perpetual characteristic of the tenure of the said ryots.

3. That the said ryots shall in future be known as absolute occupancy ryots, holding at fixed rents.

4. That the said tenure shall be regarded as entirely heritable, not only from father to son lineally, but collaterally also to nearest of kin.

5. That the said ryots shall have the power to sublet or otherwise temporarily provide by mortgage or any other like manner for the occupation and management of their land, and that our (the Malguzars') consent shall not be necessary to any such arrangement. Such manager or temporary occupant shall not be liable to pay us a higher rent than that leviable from the absolute occupancy tenant.

6. That the said ryots shall have the power to transfer by sale, gift, or will their occupancy right with all its privileges, on payment to us of a sum equal to one year's rent for such land, provided that in every such case the tenure shall be offered for sale in the first instance to us, at a sum amounting to five years' rent of such land, plus the full value without interest of all permanent improvements effected solely by the ryot, since the fixation of the rent, and shall not be sold to any other person unless we shall for the space of one month refuse or neglect to complete the purchase.

7. That the said ryots shall have power to improve their holdings, sink wells therein, and use canal water thereon, without paying us higher rent than may have been fixed as above.

8. That these conditions shall have force only in respect of the fields which the said ryots shall be recorded in the settlement papers as holding on an absolute occupancy tenure.

In Nimar and Chanda absolute occupancy ryots have restricted powers of transfer and mortgage, but any such tenant who has a right to receive compensation for improvements when he is ejected, has a right to transfer to any person so much of his holding as may be affected by, or cannot be properly separated from land affected by such improvements, together with his right to compensation on ejectment. The person to whom land may be transferred under this rule will hold as a tenant-at-will, unless the tenant from whom he received such land held under an unexpired lease which he could transfer, or possessed a transferable right of occupancy, and shall have transferred the lease or occupancy also. Every absolute occupancy tenant will also be entitled to transfer his holding, or any part thereof, with all its privileges, without the consent of his landlord:—

(1.) To any person who has become by inheritance a co-sharer with him in such holding;

(2.) To any person to whom the holding would descend on his death under the provisions of the law for the time being in force.

Absolute occupancy tenants will continue for the term of the settlement to pay rent at the rates specified in the settlement record, and will not, during the currency of the settlement, be liable to enhancement of rent, or to payment of any cesses or fees other than those leviable by common consent and village custom from all cultivators and authorised by the Chief Commissioner.

In the next class the conditional occupancy ryot is one who has acquired rights under Act X. of 1859. Notice in due form and before the end of Cheit month must be served on such ryot, stating specifically on what grounds the Malguzar intends to enhance rent. The ryot can then contest, or he can wait till the Malguzar sues formally for enhancement or for arrears at enhanced rates. But enhancement is mostly effected by mutual consent.

In the Nimar and Chanda districts all tenants cultivating (save on sír lands) at the time of settlement became occupancy ryots with rent fixed for the time of settlement. During its currency, however, the Patel is allowed to bring one suit, and only one, for enhancement of rent.

All tenants on sír lands and those who have come in since the settlement, or who have, without special

---

* This is a special rule for Chanda.

† Supplementary village Wajib-ul-arz.

HAP. I. Qn. 10.

CENTRAL PROVINCES.

Mr. Nicholls.

protection, brought in waste lands, as well as transferees of portions of absolute occupancy holdings are tenants-at-will in Nimar and Chanda.

Tenants-at-will in other districts are cultivators on sir lands, those who have fallen from the superior grades, recent settlers in the village, or those who were not at the settlement recorded as privileged holders and have not since acquired rights of occupancy under Act X. of 1859.

In Sambalpur no cultivator can be deprived of his right to cultivate a portion of the ryoti land of the village, so long as he pays his quota of the Government revenue demand.

Service holdings are lands allotted to village servants for the time being for the services performed by them to the village community.

Area of cultivated land occupied under each kind of tenure:—

As to the areas cultivated by each class I find that the holdings are now as follows:—

—	Holdings.	Area.	Average area.	Average rent.	Per acre.
			Acres.	Rs.	Rs. a. p.
Absolute occupancy tenures - - - -	149,715	2,994,300	19½	16⅛	0 13 6
Conditional occupancy tenures - - -	121,807	1,948,912	15½	12¾	0 13 0
Tenants-at-will - - - - -	469,031	6,566,434	14	8⅝	0 10 0
Service tenures - - - - -	51,073	204,292	4	*1½	0 6 0

* NOTE.—This is what the rental would be if the plots were not held on service tenures, free of rent. But no deduction would be made on this account from the total of the village assessment.

The balance of the cultivated land is cultivated by the proprietors,—in our few Byachara villages by the community, the sir, bograh, and other lands by the Malguzars, Patels, and Gaonteahs, and by Malik Makbuzas and Maafidars.

The area is 3,930,763 acres, but I cannot give the number of holdings. The total number of the settled and maafi villages in the Provinces is 36,891. I am unable to give a complete account of the numbers and the holdings of the Malik Makbuzas at the present time.

At the settlement there were in:—

Jubbulpore - - - -	4,180
Saugor - - - -	2,936
Chanda - - - -	4,063
Bhandara - - - -	2,336
Mandla - - - -	62
Damoh - - - -	2,887
Chhindwara - - - -	456
Bilaspur - - - -	1,354
Seoni - - - -	360
Hoshangabad - - -	398

In Wardha their holdings aggregated 149,202 acres. At the settlement there were 15,119 proprietors, assignees of the whole or of portions of the Government revenue demand. I cannot separate the holders of divisions of a village from the holders of whole villages. Since then some of the Malik Makbuza holdings have been purchased by Malguzars or relinquished, and some Maafi holdings have lapsed and become Malik Makbuza holdings.

As to character of the tenure affecting the economic condition of the person holding it:—

Apparently the character of the tenure is to scarcely any perceptible extent the cause of variations of this sort. Tenants-at-will can easily be found better off than the petty proprietors, although the tenants-at-will pay rent plus revenue, and the former pays only revenue.

I know of no conditions of tenure which might be changed with advantage; our settlements are of recent date; the assessments are moderate, the country is highly prosperous; we should now be watchful, but should not disturb men's minds by anticipating or mooting changes of tenure. I am sorry to see the joint proprietors of villages so often resort to partition.

BERAR.

Mr. Dunlop.

BERAR.

In Berar we have the Bombay ryotwari land tenure system. The following description of it by Mr. A. C. Lyall is taken from the "Berar Gazetteer":—*

"The English Government has now (1869) placed the tenure of land in Berar on a stable foundation. After some hesitation (for a settlement on the North-west Provinces model was first actually ordered) the Bombay system of survey and settlement according to the fields has been adopted. The whole country is being surveyed, marked off into plots, and assessed at rates which hold good for thirty years. Subject to certain restrictions, the occupant is absolute proprietor of his holdings, may sell, let, or mortgage it, or any part of it, cultivate it or leave it waste, so long as he pays its assessment, which is fixed for the term of the settlement (usually thirty years), and may then be revised only on general principles, that is, the assessment of an entire district or village may be raised or lowered as may seem expedient, but the impost may not be altered to the detriment of any occupant on account of his own improvements.

Of the restrictions on this principle some are intended to guard the rights of Government, and to check the tendency to excessive subdivision of land, the chief defect of a peasant proprietary system, and the rest to protect the interests of persons other than the occupant who may have an interest in the holding. First, if an occupant wishes to do anything which will destroy the value of his land, as to quarry in it, he must apply for permission to do so, and pay a fine to compensate Government for the prospective loss of assessment. Secondly, not less than the entire assessment of each field is to be levied. If, consequently, one share of a field is resigned, and the other sharers will not take it up themselves, nor get some one else to do so, the whole field must be resigned. Thirdly, a share field once resigned must be taken up again as a whole, and no further subdivision of shares, after the settlement is once made, is permitted.*

An occupant may always resign his holding (or any portion of it, being an entire field or distinct share in one) by simply giving a written notice of his intention before a certain date, which frees him of all liabilities from the current year. When the registered holder alienates his estate he does it by surrender and admittance, like an English copy-holder. Indeed, the Berar occupancy tenure has many features resembling the copyhold estate in the reservations of manorial rights.

Thus, in fifteen years, the Berar cultivator has passed from all the evils of rack-renting, personal insecurity, and uncertain ownership of land to a safe property and a fixed assessment. Yet we should remember

---

* Land tenures by cultivation occupancy.

* Part of this brief abstract of the Bombay system of settlement is taken from the "Indian Economist."

CHAP. I. QN. 10

BERAR.

Mr. Dunlop.

that this contrast between the two administrations, which cannot now fail to strike the generation which remembers the assignment of 1853, would not have much impressed the foregoing generation if the country had been transferreed thirty years earlier. The Berar cultivator is lucky in that he came under British management at a time when our Government had sown its wild oats and reaped the fruits thereof; when we had drained the slough of fiscal blunders and blind carelessness in which our Collectors had been floundering, and had placed them on the firm and fertile ground of method and moderation. It would be dangerous to assert that the agriculturist under the rigid, irresistible, unconscious maladministration of the early English school was even so well off as under the conscious haphazard misrule of the native government, which was kept elastic by the possibility of evasion or revolt. This rigid irresistibility is probably the prime cause of our mismanaging (as we constantly do) the land revenue of a new Province during the first years of our administration. Even in 1853, when the Nizam's talukdars had in North Berar made over to us a squeezed orange, we began by attempting to collect the extraordinary rates to which the land revenue demand had been run up by our predecessors, whence it may be guessed that the agriculturists did not at once discover the blessings of British rule.

On the other hand, there are some reasons why cession to the British should have been more popular in Berar than it usually is found at first to be. Peaceful, cultivating communities, living on a dead level of humble equality under strong tax-collectors, got none of those compensations which indemnified the Rajput clansmen of Oude for chronic anarchy, and complete public insecurity. Rough independence, the ups and downs of a stirring life, a skirmish over each revenue instalment, faction fights for land affording a good working title to the survivor, all these consolations were unknown to the Berar Kunbi, nor would they have been to his taste had they been within his power. He had as much land as he wanted without quarrelling with any one; all that he desired was secure possession of the fruits of his labour, and a certain State demand. The classes which lost by the assignment of Berar to British administrators were those who had hitherto made their profit out of native administration, the talukdars, the farmers of any kind of revenue, and the hereditary pargana officials.

The existing occupancy tenures of Berar may be thus classified. Land is held—

(1.) By proprietors who manage each his own plot in his own family.
(2.) By proprietors working together on the joint stock or co-operative system.
(3.) By the *metairie*—halving the gross produce.
(4.) By the *metairie*—halving the net produce.
(5.) By money rents.
(6.) By proprietors employing hired labour.

Land is now very commonly held on the joint-stock principle. Certain persons agree to contribute shares of cultivating expenses, and to divide the profits in proportion to those shares, that proportion being usually determined by the number of plough-cattle employed by each partner. These shareholders have co-ordinate proprietary rights in the land. If you admit a partner without stipulation as to term, you cannot turn him out when you wish to get rid of him, although you can dissolve the partnership by division of shares.

It is not always easy to distinguish proprietary shareholders from sub-tenants; but the partner is he who has put in a share of capital and stock on loan from the proprietor, and after accounting for all advances, receives a stipulated share of the net profit and of cultivation. If the sub-tenant has subscribed any capital, that transaction is adjusted separately.

The *batai* sub-tenure (*metaire*) was formerly, and is still, very common in Berar. These are the ordinary terms of the *batai* contract; the registered occupant of the land pays the assessment on it, but makes it over entirely to the *metayer*, and receives as rent half the crop after it has been cleaned and made ready for market. The proportion of half is invariable, but the *metayer* sometimes deducts his seed before dividing the grain. He (the sub-tenant) finds seed, labour, oxen, and all cultivation expenses. The period of lease is usually fixed, but it depends on the state of the land. If it is bad, the period may be long; but no term of *metairie* holding gives any right of occupancy.

Metairies are going out of fashion. As the country gets richer, the prosperous cultivator will not agree to pay rent of half the produce, and demands admission to partnership.

Money rents are also coming into usage slowly, mainly, I think, because the land now occasionally falls into the hands of classes who do not cultivate, and who are thus obliged to let to others. The money-lenders can now sell up a cultivator living on his field, and give a lease for it; formerly they could hardly have found a tenant.

Many persons now hold substantial estates, particularly in the Berar valley. These are usually village or pargana officials, who have had good opportunities of getting hold of the best fields. Several could be named who are registered occupants of 300 and 400 acres, and a few have larger holdings rated at Rs. 1,000 or upwards of land revenue. It may be affirmed, however, that in almost all instances the land is really possessed by a family of shareholding kinsmen, who assist in the management and divide the profits, not, as in England, by a single proprietor. The large landowners farm most of their fields by hired labour, providing seed and plough-cattle, though, where the lands are scattered in different villages, they are often leased out. The rate of wages of farm labourers is as high as Rs. 8 monthly[*] in the centre of the vale along the railway; in the more backward tracts it falls to Rs. 25 or Rs. 40 yearly, with food and clothing beside. Further down south the labourer still gets a share of the produce only.

The British Government introduced in 1865 a system of leasing for 30 years uncultivated villages upon terms which fix a rental rising gradually with the spread of cultivation. At the expiry of this period, the lessee will be proprietor of the whole estate at the full assessment; or he may refuse to engage for the total area, when he will subside into an ordinary patel.

Government deals only with the registered occupant or Khateedar, and we have no returns to show the area cultivated under each of the occupancy tenures referred to above.

---

[*] The rate has since fallen.

Mr. Jones

7. In judging of the replies submitted from this Province, the Famine Commission should remember that, compared with Provinces settled on the North-Western Provinces system, we labour under the disadvantage that we have not at our disposal the great store of information regarding the economic condition of the people which in such Provinces settlement officers accumulate.

To take, for instance, question 9, our survey officers do not, as a rule, prosecute the inquiries to which this question points. The Berar settlement was fixed by officers who admit that they knew little or nothing—

(*a*) of the rental of land, *i.e.*, of its letting value; or
(*b*) of its produce.

The rates determined on were deduced chiefly from the history of past collections, and from the general circumstances of each tract. The minute and careful

Chap.I. Qn.10.

Berar.

Mr. Jones.

classification of soils required by the Bombay system* to some extent takes the place of inquiries regarding produce; and I am not at all sure that the Bombay officer does not, with his somewhat empirical methods, arrive at results quite as good as those which the Bengal settlement officer arrives at after difficult research. The one thinks of *fields:* the factors which enter into his calculation are few and simple, and, more than all, his calculations are subjected to an instantaneous self-acting test, viz., whether the cultivators keep in their fields or throw them up. The other thinks of *estates:* has to balance wide-ranging probabilities, and his errors are often undiscoverable till years have passed. It is no wonder that the Bengal settlement officer is impelled to inquiries far more minute and intricate than those with which Bombay officers concern themselves. But what I would point to is that, whatever the direct result of such inquiries may be, their indirect value is very great; for a settlement on the Bengal principle leaves behind it a mass of information regarding the economic condition of the people which a Bombay settlement does not, and which in practice is never afterwards supplied. My object is not to show that our system is bad, and the other good. All I am concerned to notice is that the Bengal settlement officer is, by the nature of the ease, impelled to make inquiries which the other is not, and that he leaves behind him information which makes the reports of Bombay settlement officers seem *jejune* † and barren.

Had our settlement reports been fuller, the reply to question 9 would have been much more complete than it actually is.

8. In a preceding paragraph I remarked that Berar presents opportunities, which are perhaps unique, for the prosecution of some of the inquiries which the Famine Commission have in hand, and I gave an instance.

I might have added that the Commission can here learn what the economic position of the ryot is, when he enjoys the whole produce of his labour (excepting of course the Government share), is perfectly unfettered, and has worked under favourable circumstances. There are, no doubt, parts of the Bombay Presidency where circumstances have been even more favourable than in Berar; but, then, those tracts are probably too unlike the rest of the country to be of the highest value as standards. Here, nothing has been exceptional, though everything has been favourable.

9. The example of Berar is of further interest as illustrating the recuperative powers of a tract which bad revenue administration and political unrest had brought into very bad case indeed.

In I think the latest of his well-known works Sir H. Maine throws out the suggestion that a revenue system such as ours is less capable of making energetic and successful efforts in extending cultivation than one in which large properties are the main feature. The theory may be true, but certainly the rapid advances which Berar has made since we took it over is a fact not undeserving of weight on the other side.

10. I should expect, too, that examination of the transactions of the Currency Office at Akola might be subjected to examination with much prospect of useful result. The fluctuations in its cash reserve are enormous, and, as they are produced by Berar trade only, are the reflex of monetary movements affecting the population at large.

11. Our cotton markets‡ again offer to us information of the greatest value; for we can learn there with accuracy the dates on which the crop from the proceeds of which the land revenue is chiefly paid is turned into money; and if we only take the trouble to distinguish between cotton brought to market by cultivators themselves and that consigned by traders, may also obtain a measure, not very complete, but so far as it goes very accurate, of the steps by which the cultivating classes emancipate themselves from the hands of the Banya class.

12. The quite exceptional opportunities which I have had of becoming acquainted with, and comparing the settlement and revenue systems of the east and west of India may perhaps justify my adding a few further remarks regarding their relative merits and defects, so far as they affect the questions with which this note is concerned. To one weak point in the Bombay system of settlement I have already adverted. Another is, that it does not appear to leave behind it the same trained and experienced staff of officers which the Bengal system does. The point is one in which Berar may be peculiar; and I may therefore be mistaken. But so far as I know, there is in the Bombay survey nothing between the European superintendent and his assistants, and purely ministerial officers on low pay. The class of officers who, on the termination of settlement in the east of India, become tahsildars, extra assistant commissioners, or deputy collectors is entirely wanting. In Berar at this moment though the settlement terminated only a month or two ago, there is not a person, European or native, above the rank of a clerk on Rs. 24 or so who has had any settlement experience. And as far as appears this state of things will last for the next 20 or 30 years; and during all that time revenue administration will be in the hands of men who will lack the invaluable training which settlement work gives, and whose tendency will be to regard revenue work as something less important and less interesting than the decision of civil and criminal cases.

13. As an administrative instrument, the Bombay revenue system is, I consider, immensely superior to that of Bengal. The efficiency of the village officers here is marvellous. In the Central Provinces, a good district officer could do much on the occurrence of a crisis like a famine with the help of malguzars; but it is difficult to say what the same officer here in Berar could not do. So far as I can see almost anything might be accomplished. I was some years ago Deputy Commissioner of the Wurdha district of the Central Provinces, on the left bank of the Wurdah river; I am now in the Amraoti district in Berar, on the right bank. The very men who are malguzars in Wurdah are patels here. It was merely through an administrative accident that our patels were not also made malguzars. I have been immensely struck with the difference in the power of handling the two classes which the deputy commissioners of Wurdah and Amraoti possess. The Wurdah malguzar is, I believe, as well disposed and as amenable to advice and as willing to aid as any person of his class anywhere; but his good dispositions by no means make up for the absolute power which the Deputy Commissioner here has over his patels. These men, though often wretchedly paid, cling to their office with, as far as I can see, just as much tenacity as a malguzar clings to his estate; and the knowledge that the least supineness or neglect would in a crisis cause their wattan to be transferred to another would excite them to the utmost exertions. How long this state of things will last I do not venture to predict. Under our rule, and in spite of all we can do, these grand old village officers may lose their prestige; but certainly, considering his resources and emoluments, the patel of Berar is at present a much more useful public servant than the village proprietor across the river, and would be a more trustworthy administrative agent in a crisis.

14. On the question whether cultivators here are better off than cultivators in the Central Provinces, I scarcely like to venture an opinion. I am inclined to think that they are decidedly better off than the

---

* I here speak of the mere machinery—the mechanism of settlements—not of the great principle on which our ryotwari system rests. The two things are of course utterly distinct, though often confused.

† Let any one compare the best settlement reports of the Central Provinces with the best Berar reports, and what I now state will be admitted.

‡ I refer here to the great markets of Khamgaon, Amraoti, Shewgaon, and Akola, where every cart that enters the market is registered.

Chap. I. Qn. 1

Berar.

Mr. Jones.

average* cultivators in the Central Provinces, and that they are more independent and far less likely to go down in the world as cultivation advances and population augments. But it must be admitted, on the other hand, that the number of persons (I am speaking of agriculturists only) who live in what is for them some luxury, and whose example may perhaps tend to raise the standard of living among the whole population, is smaller here than there. It must be remembered also that one is apt in talking of Berar cultivators, to think of the khotidar only; and that information regarding the number of co-sharers and sub-tenants, and the condition of, and the rents paid by the latter is deficient. Hence I do not like to be confident. It is a curious fact that in the Central Provinces, with its malguzari settlement, statistical information regarding the lowest classes of tenants is more complete than it is here. The Bengal system, justly apprehensive of oppression by landlords, insists on full information in the annual village papers regarding tenants of all kinds. The Bombay system, thinking that it has done enough when it has looked after the field owner, does not much attempt to penetrate to the considerable and possibly increasing class beneath him. Yet this is the very information which would be perhaps of most value to the Famine Commission; for it is on the lowest class of tenants and the class of agricultural labourers that the stress of famine first falls.

15. This leads me to remark that I trust that the Commission will recommend that, when the next census of India is taken, the class of agricultural labourers shall be carefully discriminated.

---

* There would be little use in comparing the Berar cultivator with merely the privileged classes of cultivators in the Central Provinces.

BOMBAY.

Bombay.

Mr. Peile.

The tenures under Bombay may be divided into occupancy under the survey settlement, and proprietary, which includes political, service, and personal inams and religious endowments.

The only important variations from the ordinary occupancy tenure are the Khotes of the Concan, who are hereditary farmers, and the Narwadars of Kaira, who form village communities with joint rights, the Talukdars (Rajpoot proprietors) of Guzerat, and the Mulgars or superior holders in Canara. These as being all assessed to the Government land tax, are not included in inam, but they possess proprietary rights.

The number of Talukdari (Rajput proprietary) villages in Ahmedabad is 299. The area of similar estates in Broach is 47,017 acres (shares of villages). The Khotes hold 607 villages in Ratnagiri, and 166,181 acres in Colaba, and the Narwadars 70,750 acres in Kaira. All these are included as assessment-paying holdings.

The Collectors offer the following opinions on the latter part of the question.

Surat.—The Collector does not consider that the inhabitants in inam villages are better off than those in our own, except that in time of scarcity, the owners of the villages have time to inquire and means of knowing how far each man can be pressed to pay, and not press him when he cannot pay.

Khandesh (Mr. Propert).—Does not consider inam villages in Khandesh more prosperous than Government villages, and thinks intelligent Government ryots better off than inamdars. Does not think that any changes in the present survey tenure would benefit the holders of the land.

Ahmednagar.—The difference in tenure (occupancy or proprietary) does not affect the economic condition of the holder.

Sholapur.—Mr. Percival thinks the 30 years' leases too long, and that there should be a settlement every 10 years, with an engagement on the part of Government not to raise the rent of fields more than 35 per cent.

Kaladgi.—As a general rule the holders of inam lands, and especially the larger ones, are persons of some position. Their economic position is therefore superior to that of occupants of Government lands. The holders of the smaller inams are in no better condition than the holders of like areas of Government land. The present tenure suits the people and no change is desirable.

Canara.—The muli tenure is proprietary, the holders being Múlgárs. Their tenants are of two kinds. Mulgenidars who have a permanent transferable right, and chálgenidars who are tenants at will. No opinion offered.

Ratnagiri.—The Collector says—In this zillah there are 1,337 villages, of which 607 are held on the *khoti* tenure, 210 are *dharékari*, and 397 are *kitchri*, or partly *khoti* and partly *dharékari*. The rest are *khalsa* or *inám*.

The *khoti* tenure may be thus described. A superior holder, or a coparcenary of superior holders, possesses the hereditary right of settling with Government for the revenue in the gross. The khote, or the different members of a khoti coparcenary, usually hold and farm a small portion of the village lands themselves. The rest of the lands are sublet to tenants, most of whom are privileged tenants, or tenants by prescriptive right, who cannot be ousted so long as they pay the customary, or if agreed, a fixed proportion of the crops to the khotes. The standing crops are annually inspected and the out-turn appraised by the khotes. Only about five per cent. of the tenants are now tenants-at-will, and pay rack-rents, also in kind.

The *dharékari* tenure may be thus described. A dharékari holds his land hereditarily direct from the State, and pays his assessment in cash.

In a *kitchri* village, where both tenures prevail, the dharékari pays his cash assessment to the khote, who is bound to collect such assessment, and should a dharékari throw up his holding it lapses to the khote, who in any case has to pay the revenue. Inasmuch, however, as the area of cultivable land is now far less than is required for the population, *dhara* land is now never thrown up.

The khotes and khoti coparcenaries, therefore, have a direct hereditary interest in the prosperity and improvement of their villages, and by consequence in the welfare of their cultivators, most of whom, even if they fail to pay their rent, cannot be ousted except by a tedious civil suit.

The khotes, therefore, are the grain-dealers of their villages, and in a great measure occupy the position of the sowkars of the Dekkan villages, with the important restriction on rapacity that it is their interest to keep on good terms with, and to support, their old tenants.

In *kitchri* villages a dharékari is often also a privileged tenant of khoti land in the village.

CHAP. I. QN. 10.

BOMBAY.

Mr. Robertson.

The following are the chief tenures—inam, miras, survey occupancy. This latter is the chief or principal tenure. The holder has nearly all the rights of a mirasdar, excepting that the latter can after years of absence come back and relaim his land.

No right can be more secure and more full than that of a survey occupant. It is so well known as scarcely to require description from me. Briefly it may be said that he holds the land so long as he pays the Government rental. His lease is a 30 years' lease. On the expiry of his lease he cannot be ousted, but can of right remain on if he consents to the revision settlement. The increase at the revision settlement is not settled independently for his land or holding, but is a per-centage on that of his village or of a circle of villages, and depends on the rise in value of produce, the opening up of the country by roads and railways, and such like causes. His improvements are not considered and made a ground of raising his rent. He can sell, mortgage, or sublet this land without requiring any consent from Government. In fact he is virtual proprietor subject to a quit-rent varying every 30 years. If Government requires any portion of his land for a road or other public purpose, he can claim compensation, and if he decline to part with his land, Government can only secure the land under the provisions of the Land Acquisition Act.

The full freedom of transfer has, in my opinion, been most injurious to Government, and has been the real cause of the present impoverished condition of the Deccan ryot.

In paragraph 4 of letter No. 2202, dated 6th April 1877, addressed by the Chief Secretary to the Government of Bombay to the Secretary to the Government of India, it is observed :—

✓ "Formerly land in the Deccan was not the property of the ryot, and the ryot's credit was limited. The money-lender, therefore, advanced money with a stinted hand, and for some years after the conquest of the Deccan in 1818, seldom thought of having recourse to the civil courts to recover his debts, but was contented with taking all the ryot's produce, and leaving him only the bare necessaries of life. This state of things attracted attention as early as 1822, and from time to time the misery of the ryots and the danger of it to the State was represented to Government. From 1836–37, however, the land began to be settled on terms which gave the ryots a proprietary title in it. Soon finding the value of this, they began to borrow money upon it, thus to live on their capital. At first the power of selling the land for money debts, a power unknown to native governments, and foreign to the feelings of the people, was not exercised by the money-lenders. As soon, however, as the system of civil justice, introduced by the British, began to be better understood, and the ryots were getting to the end of their capital, suits became more frequent and the people became familiar with sale of land for debt."

✓ This very great concession made to the ryot without urgent need or reason, has, in place of bringing prosperity, carried distress and disaster in its train. I consider if we care for the ryot, if we care that the cultivator, the stay and backbone of our rule, shall be happy and prosperous, we must retrace our steps, undo the evil we have done, and while still securing to him all his other rights, must deny to him the right of either subletting or mortgaging his land. In short, Government should only accept cultivating tenants.

I noticed, when the revision settlement of the Dharwar Collectorate was being made, that since the introduction of the survey upwards of 25 per cent. of the land had fallen into the hands of non-cultivating occupants, persons who held the land at the small Government rental, and sublet it at rates three or four times higher than the Government rate. Thus as regards lands held by non-cultivating occupants, all the benefits of the survey settlement are lost to the poor actual cultivator.

As the case stands, a class of grasping men who were never intended to reap the benefits of our low assessments, now secure those benefits; they rack-rent the ryots for whose benefit the low assessments were introduced, and when the ryot complains of his miserable condition, teach him that it is all due to the heavy assessments imposed by Government.

Col. Anderson.

All land in the south of the Bombay Presidency, in Berar and in Mysore, is held on one of two tenures under Government by the survey settlement, "enam," or entirely or partially free from land tax, or "Government," that is, paying full land tax heritable and transferable and retainable undisturbed so long as the land tax for the time being is paid. This is subject to revision at 30 years' intervals. Enam lands are of two kinds, plots or fields of varying sizes in Government villages, and whole villages of which a considerable proportion exist throughout the southern half of Bombay, a full 20 per cent. of the total villages. The enamdar ordinarily exacts higher assessments than are paid on Government lands. In a large proportion of cases these villages have been, at the request of the enamdar, settled, but it is commonly necessary to impose rates higher than in adjacent Government villages to secure his consent to the settlement. The ryots notwithstanding gain by obtaining a security of tenure which they did not possess before.

I do not think there is any material difference in the condition of the petty enamdar and that of the Government ryot. The ryots in enam villages and in jaghir territory are certainly in an inferior condition of prosperity to those in the Government villages.

As regards any change in relation to unrestricted freedom of transfer of land, it has during recent years become a question whether it would not have been better in the first instance had some check been placed upon entirely unrestricted transfer, but having once been granted by law, it is difficult to see how it can be now withdrawn. I doubt much if any checks which could have been imposed even in the first instance would not have been practically evaded, and whether on the whole they would not have done more harm than good.

Mr. Pedder.

With reference to this question, you will doubtless have very full information regarding tenures from the different Collectors, and I need not touch on them. But there is one point on which the inquiries I have lately been making in connexion with the license tax appear to throw some light.

✓It is very often argued that, whatever advantages the ryotwari system of tenure prevalent in this Presidency may have, it tends to keep the people at a dead-level of poverty, to confine them to agriculture for their means of living; and that, with another system of tenure, one under which the cultivators, instead of being proprietors paying assessment to the State, should be tenants of private landlords, a larger proportion of the population would engage in commerce and manufactures, and the aggregate production and wealth of the community would be increased.

Now, there are two Bombay districts in which the khoti tenure prevails, in Ratnagiri, almost entirely; in Kolaba, to the extent of about half the district. Under this tenure, the actual cultivators are tenants (some customary, some at will) of the khotis, or village landlords.

For comparison with these districts as regards the proportionate numbers and wealth of the trading and manufacturing classes, I have selected the three

CHAP. I. QN. 1

BOMBAY.

Mr. Pedder.

poorest Deccan districts. With the exception of the city of Poona, neither of the tracts under comparison contains any large cities. Neither raises any very large quantities of exportable produce. If anything, the advantage in this respect is with the Konkan, which exports by sea a good deal of rice and wood, while the part of the Deccan selected grows hardly any cotton. Neither tract is remarkable for fertility; but the Deccan soil and climate is very unproductive. The climate of the Konkan tract is favourable to production, and it contains a good deal of very fertile land. The Deccan tract is far inland, cut off from the sea by the Ghâts, and Sattara and Nagar are not traversed by a railway; while the Konkan tract has numerous ports, affording easy and cheap water communication with the great mart of Western India, Bombay, and all trade between the Southern Deccan and the sea passes through it. The Deccan tract has recently suffered severely from famine, the effect of which must have been seriously to diminish the resources of its traders. For these reasons one would, I think, expect to find that the advantage as regards proportionate numbers and wealth of the manufacturing and commercial classes would be with the Konkan tract. The following table, however, shows that this is not the case:—

DISTRICT.	Total population by census of 1872.	Adult male trading, manufacturing, and artisan population by census of 1872, *i.e.*, population assessable under the Act.	Number of those entered in column 3 who have been assessed to license-tax.	Assessment to license-tax.	Proportion of assessable (column 3) to total population; per cent.	Proportion assessed to assessable, *i.e.*, proportion of column 3 having incomes of Rs. 100 a year and upwards.	Rate of tax per head of column 4, being 2 per cent. on the average assessed incomes
1	2	3	4	5	6	7	8
				Rs.			Rs.
Ratnagiri - -	1,019,136	53,323	8,241	43,388	5·2	15·4	5·16
Kolaba - -	350,405	15,289	5,929	34,250	4·3	38·8	5·97
Nagar - -	773,938	48,707	12,446	77,214	6·3	25·5	6·20
Sattara - -	1,061,002	61,137	19,823	1,11,755	5·8	32·4	5·64
Poona - -	967,235	64,175	22,268	1,33,245	7·1	34·6	5·98

These figures tend (I need not say that the inference from an induction so incomplete as this must be accepted with caution) to show that, on the whole, under the khoti tenure, as compared with the very poorest ryotwari or peasant proprietary districts, the trading, manufacturing, and artisan proportion of the population is smaller; that it is generally poorer, and that it comprises fewer well-to-do people; and that the difference in these respects is more marked in the district where the khoti tenure prevails most exclusively.

With regard to the latter portion of question 10, I would state briefly that with the Bombay settlement on peasant proprietary tenure, under which by far the greater part of the land of this Presidency is held, land can be transferred without any restriction, and more easily and cheaply than in any civilised country I know of. Unrestricted freedom of transfer is a product of British law and administration, since strict hereditary entail of landed property was the rule of Hindu law, and the practice till after the introduction of British rule. In my humble opinion we have erred in making the change; it has, in conjunction with our system of administration of civil justice, greatly facilitated the loss of their patrimony by the landowning and peasant classes; and this has caused grave discontent among those the most important, most valuable, and most peaceful orders of the community. It has tended to frustrate the efforts of Government to improve their condition by measures intended to give greater security of tenure, to limit and regulate equitably the State demand on the land, and the like. And, so far as I am aware, it has been attended by none of the social or economical advantages which were anticipated from it. In this, I think, we adopted principles recently established after long discussion in England, without duly considering how different are the circumstances of the two countries; that India is centuries behind England, and that it is very doubtful whether the abolition of all restrictions on the transfer of land would not have been a century or two ago a premature and mischievous measure in England.

But whether we can now retrace our steps with due regard to the interests we have created without doing more harm than by maintaining our present policy, is a question which requires very mature consideration.

SINDH.

SINDH.

Col. Haig.

The agricultural class in Sindh comprises holders of land, large zamindars, and peasant proprietors, all enjoying proprietary rights, and tenants-at-will. The proportion of land cultivated by tenants-at-will is perhaps three-fifths of the whole. As might be expected, such tenants are bad cultivators, and their condition is a poor one. With very rare exceptions the practice is for the tenant to pay a share of the produce, one-third to three-fifths. He has no inducement to increase exertion or improve his husbandry, and he seldom rises—or cares to rise—above a mere hand-to-mouth existence. The class containing the greatest number of prosperous agriculturists is probably that of holders of 30 to 50 acres, who are themselves cultivators, though undoubtedly this could not be said if the large holders as a class possessed the virtues of thrift and industry. The few who are prudent and diligent managers of their property are in very comfortable circumstances, and some are reputed to be wealthy. I should hesitate to interfere in any way with the conditions of tenure.

HAP. I. QN. 10.

MADRAS.

The Board of Revenue.

MADRAS.

An exhaustive description of the tenures prevailing throughout the Presidency cannot be attempted in a set of replies of this kind, and the Board will confine themselves to briefly indicating the leading characteristics of the more important of the different tenures on which land is held under Government, and of the sub-tenures peculiar to the different districts as reported by Collectors.

The tenures on which land is held under Government may be divided into three great classes—

(*a.*) Ryotwari;
(*b.*) Zemindari;
(*c.*) Inam.

The distinctive feature of the ryotwari system, which is the most common tenure in the Madras Presidency, is the direct contract between the Government and the ryot, who is usually the actual cultivator of the soil, and, under existing usage, to all intents and purposes the actual proprietor of the land entered in his pattah or extract from the Government register. A lien on the land is retained by Government till the assessment due thereon is paid; but the right of a ryot to sub-let, mortgage, or sell it, is subject to no other restriction. The ryot has the option annually of increasing or decreasing his holding or relinquishing it altogether; and, this, together with the practice of adding extra charges for second crop when it is raised with the aid of Government water, and water-tax when lands classed as unirrigated are irrigated, and of allowing remissions for loss of crop from causes beyond the ryot's control, renders it necessary to have an annual settlement to determine the amount to be paid by each ryot. The rate of the regular assessment of the holding is never varied at these annual settlements. New assessments now made by the Settlement Department are fixed for a period of 30 years.

The holdings in Malabar and Canara are classed as ryotwari, but in the latter district the rent is fixed as a lump sum payable on the estate or holding, and not, as elsewhere, on each individual field, and in both districts the right of private property in the land, now practically accorded to every ryot in the Presidency, appears to have always existed without interruption.

The village joint-rent system, which prevails to a small extent, is practically the same as ryotwari, though in theory the whole community are jointly and severally responsible for the revenue, the extent of each villager's individual liability being arranged amongst themselves.

The holding of a zamindar is usually a large tract of country, and the zamindar has a proprietary title as against Government, subject to the payment of the land dues or peshcush. In the case of the ancient zemindaries, the law of primogeniture prevails, and the zemindar cannot encumber or alienate the estate beyond his own lifetime if he has sons or son's sons entitled to inherit the property. He can, however, sell portions to save the entire estate, or to clear off family debts. The estates conferred under Regulation XXV. of 1802 follow the ordinary rules of Hindu property, and are described as zemindaries, proprietary estates, muttahs, &c. Poligar estates or polliems are ancient feudal estates, but in many cases permanent title-deeds were granted for them under the provisions of Regulation XXV. of 1802. This, however, does not prevent their following the law of primogeniture according to the ancient custom.

Inam lands (known as jaghires, shrotriems, maniems, &c.) are those with reference to which the Government has waived its right to the assessment, or to a portion of it, as a reward for past services rendered, or as a remuneration for duties to be performed, or on account of religious services to be executed so long as the inam is held. A large number of these inams were granted by former Governments, subject to various conditions, but many have been enfranchised within the last 20 years; the right of Government to prevent alienation, or to resume, or to demand service, having been commuted.

The area of the Presidency may be divided between the three classes as under, all Government waste being shown under ryotwari—

With regard to the bulk of the zemindari tracts the cultivated area is not known. Excluding the Maliahs of Ganjam, with an area of 5,715 square miles, the cultivated area under ryotwari and inam is as follows:—

	Square Miles.
Ryotwari - - -	28,671
Inam - - - -	8,558

The most important and widely spread tenure not held direct from Government is that of a ryot or cultivator holding under a zamindar, shrotriemdar, jaghiredar, &c., who, in theory, is usually held to be in precisely the same position as a ryot holding direct from Government, but in practice is not so. The old controversy as to whether the ryot had any proprietary rights in the soil has long since ceased to have any practical interest in ryotwari tracts; the ryot's inviolable right to possession so long as he paid the assessment having been freely conceded and as freely acted upon, holdings being constantly bought and sold without any doubt being thrown on the purchaser's title. Some uncertainty has recently been revived with regard to the exact legal position of the ryot by recent decisions of the High Court; but there is no reason to believe that the general confidence in the well-established policy of Government has been in any degree shaken. In zemindari tracts, however, the ryot's position is far from being so secure, owing mainly to the effect of the decision of the Madras High Court in Special Appeal No. 9 of 1870.

The highest court of the land has declared that a zamindari ryot is a mere tenant-at-will, unless he can prove a specific contract or customary right of occupancy. As specific contracts bearing on the question of right of occupancy are but few, and as it is not easy for a poor ryot to prove customary right as against a zemindar, resistance to a suit of ejectment brought in a civil court is not infrequently unsuccessful. The Board of Revenue looked upon the decision at the time as one of serious importance to the community, and addressed Government on the subject in their proceedings, dated 1st September 1871, No. 3,876, in which, after expressing their opinion that the local Legislature in passing Act VIII. of 1865 (Rent Recovery Act) supposed it had secured the right of occupancy to the tenantry of "zamindars, jaghire-

" dars, shrotriemdars," they strongly recommended that an enactment should be obtained affirming the right in unmistakeable terms. There seems to have been a difference of opinion amongst the members of Government, for nothing further was heard of the matter till 1876, when reports were called for from all Collectors as to the results which had ensued from the decision in question. The reports of the local officers are now under the Board's consideration.

The following remarks by Collectors have reference to this question. A hazy idea is sometimes evinced of what it was that the court actually decided, but all indicate that the decision tends to reduce zamindari ryots to the position of mere tenants-at-will, unless protected by a specific contract:—

Ganjam.—" A zamindari ryot is liable to be turned out at the will of the landlord under the High Court's recent construction of the law.

Vizagapatam.—" In zamindaries, rents have for many years been raised after a slight struggle, at the will of the zamindar. Since 1865 no one has ventured to struggle, Mr. Collett, then Civil Judge, having in that year decided that the law forbidding enhancements without cause shown was a dead letter."

Bellary.—" The law as to the status of tenants under zamindars, shrotriemdars, &c. is in a most unsatisfactory state. Act VIII. of 1865 and the Acts upon which it is based were long considered to declare a right of occupancy in the tenant. That view has been declared to be unfounded by the highest judicial tribunal in the country."

Salem.—" The position of zamindari ryots has undergone a change under the High Court's ruling in Special Appeal No. 9 of 1870, according to which the zamindar is competent to oust the ryot at the end of each fasli, notwithstanding the punctual payments of the kists by the latter. This is, in effect, making him (ryot) a tenant-at-will. This decision is fortunately not very well known, or they (zamindars) would have probably used this as a powerful engine to carry out their own private piques, to the serious detriment of the interests of the ryots, who have sunk capital in improvements in the belief that the tenure was permanent so long as they paid their rents punctually."

The Sub-collector of Madura writes : " The zamindári tenure is a sub-tenure, but in this part of the " country the economic condition of the tenants differs " seldom from that of tenants under ryotwári. The " Government rules are known and very much fol- " lowed in the matter of giving leases and keeping " accounts, but occasionally a zemindar takes advan- " tage of the bad drafting of Act VIII. of 1865, to " inflict some injury on troublesome ryots."

It may be said generally that the occupancy rights of tenants under zemindars and inamdars have been less questioned in the southern than in the northern districts. The Collectors of Tanjore and Trichinopoly write as if there were no doubt in the matter. With regard to many inamdars there can be no room for question that they are nothing more than assignees of public revenue.

Even when the occupancy rights of a zamindári ryot are unquestioned, there is another way in which he is worse off than a Government ryot. The assessment paid by the latter has been commuted for a long series of years into a fixed money-rent, the commutation having been made at rates much below the present ruling market price. The zamindari ryot has usually to pay a share of the produce, and even if this be commuted to a money payment, the rate of commutation is usually subject to frequent revision. In many cases, the payment is actually made in kind, and where this practice prevails, the cultivator is not allowed to harvest his crop until the landlord's share has been secured.

The tenants of Government or zāmindari ryots are usually tenants-at-will, a common arrangement being that half the produce goes to the lessor and half to the cultivator, either in money or in kind. The shares vary, however, in different localities, and frequently with reference to the amount of agricultural stock provided by each party. There are some exceptional sub-tenures carrying proprietary or occupancy rights, and these will now be briefly noticed so far as they are dealt with in the Collectors' reports.

From the Godavari district it is reported that there are sub-tenures with right of occupancy in the Bhadrachellam taluk, but no particulars are given. The Sub-collector of Madura writes : " The ordinary sub- " tenures under lease run from one year to five years, " and the ryot's share is generally by agreement from " one year to five years and hardly ever more. The " occupancy right ceases with the leases, and there is " no claim for renewal."

In South Canara there are three distinct kinds of sub-tenures described as follows by the Collector : " Mulgeni (permanent lease), chalgeni (yearly or " temporary lease), and waidageni (for a fixed " period). The tenant holding under a permanent " lease has full right over the land, including the " right of transfer of his lease. Such permanent " leases are sometimes given by the landlord on pay- " ment of a fine or premium, and the holder of the " land under this lease is rather a subordinate pro- " prietor than a tenant. Under the mulgeni tenure " the tenant has to pay a fixed rent. The next is " chalgeni or temporary lease. These are renewed " every year, and the landlord possesses the right of " raising the rent. Waidageni: under these the tenant " holds the land for a fixed period, with the option of " making improvements, the value of which will have " to be paid by the landlord when the lease expires. " This kind of lease is not very common. The mul- " geni may be roughly taken at 14 per cent., chalgeni " at 84 per cent., and waidageni at 2 per cent."

The Collector of Malabar writes : " The Malabar " system of land tenures is almost perfect in theory. " The highest title is that of an unencumbered " jenmom (birth right), the absolute proprietary " right or *plenum dominum*. Beneath it come great " numbers and forms of usufructuary and other mort- " gages, and at the end of it comes the *verumpattam* or " simple tenancy-at-will. The tahsildars estimate the " cultivated lands under the different kind of holders " in different parts of the district at from 20 to 60 " per cent. of superior title-holders, and from 80 to " 40 per cent. of simple tenants-at-will; but in the " greater portion of the district 75 to 80 per cent. of " the land seems to be in the hands of simple tenants- " at-will. It is the custom of the country, however, " to give the value of all improvements, ascertained " by local usage, when a tenant, even if only a " tenant-at-will, is ejected, provided, of course, the " landlord knew of the improvements being carried " out. The condition of a large proportion of " tenants-at-will is very far from being satisfactory, " owing to the grasping avarice of the landlords, who " in many cases rack-rent their land. Even when " the tenant holds the most common form of mort- " gage lease (kanom) the landlord when renewing the " lease, which can be done every 12 years, exacts so " large a fine from the mortgagee that he is little " better off than a tenant-at-will."

In regard to the character of the tenure appearing to affect the economic condition of the person holding it, the general opinion seems to be that as the position of a Government ryot is in every way more secure than that of a zamindari ryot, and the terms on which he holds more favourable, his economic condition is more satisfactory. The hard and fast lines laid down by Government in respect to payment of dues, &c. sometimes seems to operate harshly when compared with the readiness of some zamindars to allow their tenants time to pay, but the ryot is seldom the gainer in the long run. With regard to assistance in time of distress, the Collector of Bellary remarks : " Recent experience has shown that shrotriem ryots " could get little help from their landlords who were " themselves in difficulties * * * *. " The famine found the Sundur State least prepared

HAP. I. QN. 10.

MADRAS.

'he Board of Revenue.

" to meet it. That State felt it first, felt it most " severely, and is last involved in it, in spite of " excellent European supervision and Government " funds."

Are there any conditions of tenure (such, for instance, as unrestricted freedom of transfer) which might be changed with advantage to the holder and without injury to other parties?

All Collectors who make any reference to the specific instance adduced in this question unite in deprecating any interference with freedom of transfer, and in this the Board concur. Many Collectors recommend legislation to secure occupancy right to the ryots in zamindaries, shrotriems, &c. As already stated above, this question is under the Board's consideration. It may now be remarked, however, that any recommendation the Board may make will be with the view of removing uncertainty with regard to existing rights rather than of introducing changes.

The practice of allowing compensation to temporary tenants for improvements effected with the knowledge of the landlord reported as prevailing in Malabar and to some extent in Canara is one which it might be well to secure by legislation to tenants throughout the Presidency, but the matter is one which calls for much consideration in detail, and the Board are not at present prepared to do more than offer a suggestion.

MYSORE.

MYSORE.

The tenure of the district is ryotwari, which may be described as a sort of perpetual leasehold, with the further advantage that the ryot, when compelled to do so, can resign his lease without any penalty or loss. It has been objected to this system that it subdivides the land too much, encourages a class of petty ryots who almost live from hand to mouth, and the like. This is true in a limited sense, but on the other hand it has raised up, and is still raising up, a large body of independent and frugal men whose conduct throughout the famine has been marvellous. Uncomplaining, and, as a rule, law-respecting, they were reduced to fearful straits, and subsisting almost on nothing, they managed to keep themselves and cattle alive, and, with their carefully-hoarded small stocks of seed grain, were in a position again to till the ground as soon as seasonable rain fell, thereby assuring, it is trusted, not only comparative plenty to themselves, but a fair land revenue to their paramount landlord—the Government. This sturdy independence and self-denial are surely begotten of their quasi-proprietorship with all its binding traditions and religious observances, and thus true husbandry and its concomitants of frugality and perseverance have taken deep root and developed a class of ryots who, in an economic point of view, are probably not to be surpassed in India. There are probably individual classes elsewhere who may be noted for more intelligence or more industry, but as a mass the Mysore ryots are the backbone of the country, and be it noted that it is the tenure that has made the provident ryot, and not the ryot who has developed the tenure. Instinctively almost it occurs to the ryot to foster in every respect and to protect his rights and interests in matters of grazing, fuel, and wood, &c., for what benefits him benefits the Government, and he is not slow to acknowledge his obligation where he has the ability to discharge his Government dues to the last anna.

AJPUTANA.

RAJPUTANA.

Dholpur.—Lieut.-Col. Dennehy.—The tenures in Dholpur are to a great extent similar to those which existed in the North-Western Provinces when British rule was first established.

The ownership of all the land is vested in the State, which claims the power to eject the zamindar, although practically this power is never exercised as long as the State demand is regularly paid.

The State also possesses a right to the waste land within the boundaries of each village, in excess of what may be required for the grazing of the village cattle.

The zamindar is looked upon as a cultivator with rights of general management, and a portion of the rental is allowed to him for the trouble of collection.

Under the new settlement the proportion thus allowed to zamindars averages 24 per cent. on the land revenue of the entire State.

Tenants have no acknowledged rights either of occupancy or of holding at fixed rates. Practically, however, they do hold at well-known and long established rates, and in a thinly populated State they are so much in demand that they are not subjected to much interference in their holdings.

Transfers of land to outsiders are not usual; shares which are sold, either on account of failure of the possessor to meet the Government demand, or from other causes, are generally taken up by some of the other sharers in the village community or by relatives in neighbouring villages.

Kotah.—Major Powlett.—Paragraphs 10 and 14. —In Tonk proprietary right seems to be recognised; for holders can sell their land, and ryots absent for years are allowed on their return to re-occupy their lands.

In Boondee, in Colonel Tod's time, the land was the property of the cultivator;* but now throughout Haraoti, as elsewhere in Rajputana, the land is State property. In Boondee, however, the position of the occupier is much better than in Kotah, where Zalim Singh's handiwork still remains. Thus in Kotah the cultivator cannot sell his land nor mortgage it; though practically such transactions occasionally take place.

A cultivator cannot resign a portion of his holding and retain the rest. He must either keep the whole or give up the whole; and he can claim no abatement of rent in consideration of a failure of crop. In Boondee, on the other hand, although a man cannot sell his land, he can mortgage it freely; and the mortgagee can sub-mortgage it without limit. In Boondee, too, a cultivator can not only give up a single field and keep the rest, but if the crop is not worth the rent, he may turn his cattle into it, and escape any State demand. There are other advantages in the Boondee system which I will not here dwell upon.

In Tonk many villages are given in contract, usually to outsiders; but both here and in Haraoti the tenure is ryotwari. Rents are generally paid in cash, not in kind; and rent-rates, once established, do not vary. Thus, in Kotah, Zalim Singh's rates, imposed 100 years ago, still prevail, though they have been rendered more burdensome by the imposition of heavy cesses in the shape of per-centages on rent, and equal extra charges on all land. However, if fairly distributed, the revenue in average years is not burdensome. The following shows the average mortgageable value of land in Tonk (city pargana) and in Boondee:—

---

* *Vide* a very interesting foot note to be found in Chap. VIII. *Annals of Haraoti.*

CHAP. I. QN. 10.

RAJPUTANA

Major Powlett.

—	Good well-land.	Unirrigated average land.
	Rs.	Rs.
Tonk	10	8
Boondee	15	12

In Tonk, where land is sold, the saleable value is, I am told, about double the mortgageable.

In Boondee, judging from inquiries made in two localities far apart, from one-fourth to one-fifth of the land is mortgaged, chiefly to money-lenders.

CENTRAL INDIA.

CENTRAL INDIA.

Mr. Wingate.

Bhopal.—Each village is in charge of a lumberdar appointed for 20 years, who distributes the land among the cultivators at a fixed Government rental on which he gets 10 per cent. commission from the State. Land cannot be transferred from one cultivator to another, so long as the occupier pays the Government rental.

Baghelkhand.—" As has been said before, there are no proprietary or occupancy rights in Baghelkhand, the sovereign of the State being the sole proprietor of such.

" In the Kothao or Khalsa villages, which form about one-third of the total number in the State, both in jumma and cultivated land, leases, as a rule, were given from year to year, in order to prevent any such rights being established. Nearly two-thirds of the whole of Rewah (and the same is applicable to the rest of the district generally) is held rent free under the following tenures :—

" 1. Paipakhar, rent free grant to Brahmins and priests.

" 2. Murwar, rent free grant for loss of life in battle.

" 3. Birt, rent free grant for good service.

" 4. Rajbhog, rent free grant for temple endowments.

" 5. Jaghir, rent free grant in lieu of pay, but is liable to exchange and resumption.

" 6. Muamla, grants to the brotherhood, subject to a payment of one-fourth of the jumma of the village."—*Lieut.-Colonel Bannerman.*

Rutlam.—" The revenue settlement in this district is periodical. The existing settlement is for 15 years. The actual jumma of each cultivator is settled, and during the term of the lease no one can demand from him more than the stipulated sum, whatever may be his improvements. Every village is also given in ejara to the patel of that village, allowing him a reduction from 7½ to 10 per cent. from the gross jumma he is to collect from the cultivators of his village as a compensation for his responsibilities and supervision, besides a rent free plot of culturable ground varying according to the size of each village from 25 to 200 beegahs. He is responsible for the well-being of his village, as well as the full payment of the State revenue whatever may be his own receipts, but he is very seldom a loser. No one has power to make any alteration in the stipulated tenure without the consent of the State. The character of the tenure is favourable and the settlement mild, and therefore popular. The agriculturist having the right of enjoying the profit of his produce and improvements fully."—*Mir Shahamat Ali, C.S.I.*

Manpur.—" In seven of the villages of the pargannah, cultivators, called malgoozars, hold their estates under a twenty years' settlement, which was made in A.D. 1867. They are individually and collectively responsible for Government revenue, and enjoy the right of sub-letting the waste land in their possession on their authority or on rates they think fit to fix within the rates authorised by the settlement. They are thus free to enjoy all the profits which increased or improved cultivation in their villages may bring about. In the remaining unsettled villages the cultivators enjoy no rights, but that by usage they cannot be dispossessed of their holdings as long as they continue to pay Government revenue regularly. The malgoozars of the settled villages are alone recognised to hold proprietary rights, but in no case has any cultivator in settled or unsettled villages ever attempted to exercise the right of transfer by either mortgaging or selling the fields held by him."—*Pundit Suroop Narain.*

CHAPTER I.—QUESTION 11.

CHAP. I. QN. 11.

Are the holders of the above tenures in the habit of carrying out material improvements, such as digging wells or channels, necessary in order to use the water in a canal? Are their actions in this respect affected most by the security or insecurity of their tenure, or by their wealth or poverty? Or are there any other reasons which hinder such investments of their labour and capital? What have been the effects of recent Land Improvement Acts? Have they tended to enlarge or narrow the making of advances by Government? Does the condition of the country render it desirable that the operation of these Acts should be facilitated, or their scope enlarged, and are there any apparent difficulties in the way of doing this that could be removed? Is the demand for interest on Government advances obstructive or prohibitory?

PUNJAB.

PUNJAB.

Mr. Gore Ouseley.

The owners of land, and in some places occupancy tenants, do carry out the material improvements enumerated in the question. Their actions in this respect are affected chiefly by their pecuniary means and by the degree in which they possess provident habits. Many wealthy landowners squander their means without bestowing a thought on improving their estates. The effect of the Land Improvement Acts has tended to enlarge the making of advances by Government. The provisions of the Acts afford, I think, all due facilities, compatible with the safety of the advances made, for their being easily obtained. During the present year special advances to the amount of Rs. 1,80,000 have been made in seven districts only. The rate of interest is, I think, sufficiently moderate.

Chap. I. Qn. 11.

Col. W. G. Davies.

First as regards proprietary tenures.—There can be no doubt whatever that village communities and individual proprietors are in the habit of making material improvements. This is well known to all who have had any revenue experience in this part of India. To obtain particular information as to what had been done in this way in Karnál and Gurgaon I addressed the Deputy Commissioners of those districts. Mr. Ibbetson regarding Karnál writes as follows :—

"During the 35 years since last settlement about 300 masonry wells have been built by them (the proprietors) ; moreover, almost the whole system of canal distributories, which up to within the last 3 years irrigated more than 1,00,000 acres, has been created by the people with such small assistance as the remains of old water channels afforded them."

Mr. Roberts writes with regard to Gurgaon that the settlement operations have lately retarded the investment of money by the proprietary classes in improvements, but that since the announcement of the jamas applications for Takávi have commenced pouring in, so that between June 1877 (when the new jamas were given out) and 1st April 1878 applications to the amount of Rs. 17,325 had been received, of which Rs. 14,000 was paid and the rest would be provided for out of the current year's allotment.

There can be no doubt, I think, that security of tenure has most to do with the investment of capital in improvements in the case of tenants ; for tenants-at-will never, I believe, incur expense in sinking wells or other irrigation works, and tenants with rights of occupancy only to a very limited extent, though the law (sections 37 and 38 of the Punjab Tenancy Act) seems to recognise a right on their part to improve the land in their occupation. In the case of *proprietors*, their tenure being absolutely secure, their wealth or poverty has more to do with the decision of the question of whether they shall lay out money in improving the land, than the nature of their tenure.

It is difficult to say what have been the effects of the Land Improvement Act. Before a sound opinion on this point could be given a special inquiry would have to be made, including a collation of the statistics of the number and amount of the advances made under the old and new rules. My impression is that at first, notwithstanding the more liberal terms as to the repayment of advances under the Land Improvement Act, the number of applications for advances made after its promulgation fell off very considerably. This, however, was not due, in my opinion, to the demand for interest so much as to the cumbrous and rigid nature of the rules issued under it, which require so many forms to be gone through before the advance can be made, and compel repayment with such stern exactness. If we wish to encourage the taking of advances we must simplify the rules and render them more elastic by giving power to the local authorities to relax them where necessary.

It is unnecessary here to enter into any detailed explanation of how this should be done.

Mr. J. B. Lyall.

I propose to write of the Mooltan and Derajat divisions, in which I have been serving as Commissioner of Settlements for the last six years, during which time settlements have been in progress in all seven districts of those divisions.

2. In the whole of this country (excepting parts of Bannu) the rain-fall is too small to admit of land being periodically cultivated with rain-water only; for all regular farming some other means of irrigation are necessary.

In the Trans-Indus country the torrents which flow after storms in the Súliman mountains flood the daman or high sloping plain along the edge of the hills ; the low lands in the khadirs of the Indus, Sutlej, Jhelum, Chenab, and Ravi are moistened by the sailáb or floods from those rivers which occur between May and September.

These same floods fill the inundation canals which in Dera Ghàzi Khan, Muzaffargarh, Mooltan, and part of Montgomery, irrigate certain tracts which are out of the reach of the river floods, or which are artificially protected from such floods by embankments.

Wells are much used to supplement the sailáb in khadir lands ; they are also almost always used to assist in the cultivation of land on inundation canals. Without wells such lands could only grow one kharíf crop, and even that might fail if the canal ran dry for a time.

In the Bár or Thal upland tracts, which occupy the centres of the Doábs between the great rivers, and which are out of the reach of floods or canals, wells are the only means of regular cultivation. But the profits of such cultivation by well alone are always small, and when two or more years of unusually small rainfall succeed each other, many such wells are thrown out of cultivation, ordinarily till better times come, but sometimes permanently. In some parts of these upland tracts the water is too far below the surface or too salt to be profitably used for irrigation.

3. The landowners in the country I am writing about are, of course, in the habit, so far as their means allow, of digging wells and canal watercourses. All the canals have, I should say, as many watercourses as they can properly supply, if they have not more. Wells are, as I have said, agricultural necessities in the upland and canal-irrigated tracts; in sailába or riverside lands they are not so very necessary, and the serious risk of their destruction by floods or diluvion checks their construction. Except in these riverside lands, cultivation has followed the construction of the well or canal, not preceded it.

There is no law that I know of which checks the landowner's readiness to improve his land by digging wells, watercourses, &c. The expectation of having to pay increased revenue does check the making of such improvements to a considerable extent, when the term of a settlement is near its close. I have observed a decided suspension of such works during and immediately before settlement operations, and a sudden outburst of them when the new settlement was concluded. The fact that a new settlement is impending has a greater effect on such works than it ought to have, seeing that it is a rule of our revenue system that protective pattahs for terms of 20 years are granted by Government to constructors of new wells, and for 10 years to repairers of old wells and diggers of watercourses. As this rule becomes more thoroughly known, and as the confidence of the people in our really acting up to it increases, the effect of an impending settlement will greatly diminish.

4. Tenants are not in the habit of digging wells or canal watercourses ; by the custom and feeling of the country it is the business of the landowner to sink a well or dig a new watercourse, and he also has to keep the well in repair, and in some places he does the annual clearance of the watercourse. As I said above, the making of the well or watercourse precedes the cultivation of the land, and therefore the occupancy of the tenant, except in the case of sailába lands, and a tenant of sailába land does not ordinarily hold enough land in one block to induce him to sink a well in it, and like the proprietors he is deterred by fear of diluvion.

Waste lands are often brought into cultivation by agreement between the landowner and other persons, whereby the latter bear the expense of sinking the well or digging the watercourse, and in return become owners of a half or smaller share in the land so cultivated. These contracts are locally known as adhlapi or taraddad-kári agreements; they were formerly more common than at present, as the proprietary right has become more valuable, and the landowners are less and less willing to let it go out of their own hands.

Chap.I. Qn.11

Punjab.

Mr. J. B. Lyall.

It was also very common in former days for landowners to take a lump sum of cash called jhuri or siropá as a fine on institution, and in return for allowing a non-proprietor to sink a well and to hold the land attached as a sub-proprietor, subject to payment to the original landowner of nothing more than a small fixed quit-rent or proprietary fee. This is sometimes done even now, but the fine, which used to be light, is now heavy, in fact not much below the full market price of the land granted.

There is nothing in the law to prevent tenants from sinking wells or digging watercourses for the improvement of land in their occupancy; the Tenant Act allows them to make such improvements, and the Canal Act has clauses which facilitate the making of watercourses. But of course a tenant-at-will can practically do nothing without his landlord's consent, as the latter can stop his proceedings by serving notice of eviction, and in spite of provisions of the law the majority of occupancy tenants cannot afford to disregard their landlord's wishes.

But in this part of the country most landowners would be delighted to see their tenants make wells or dig watercourses in land not already provided therewith, if the tenants had the energy and capital to do it, and did not demand proprietary right or too great privileges in return. I do not think anything more can be properly done than has been done to facilitate the making of such improvements by tenants.

5. Where the State is the landowner, as it often is, of the waste lands in this part of the Punjab, I think that the present rules for the sale or lease of waste lands are ill adapted to the country, if it is advisable to encourage the extension of cultivation and the digging of wells and canal watercourses in such lands. I have expressed my views on this subject in my review of the Montgomery Settlement Report, and in a letter forwarding to the Financial Commissioner Mr. Broadway's application for the lease of waste land in Jhang.

6. I have had nothing to do with the working of recent Land Improvement Acts, as I have been engaged in settlement work since 1864. In conversations which I have had from time to time with natives I have heard that few advances are taken. The mass of people are frightened by the prescribed formalities, and at the prospect of having to dance attendance at public offices; they also dread entering into agreements with so powerful a party as the Government. Under these circumstances the only men likely to apply for loans to Government instead of to the Saucars are, first, a few influential and intelligent men who feel that they need not be afraid of Government or its officials, and, secondly, unsafe men who cannot get credit elsewhere.

The difference between the rates of interest demanded by the Government and the Sucars will not tempt the mass of the people in the face of the other strong reasons which they have for preferring to deal with the Saucars. I think it would have a good effect in encouraging advances and in other ways if Government asked for no interest except upon arrears of instalments.

NORTH-WESTERN PROVINCES AND OUDH.

North-Western Provinces and Oudh.

Mr. Quinton.

The question deals with two main subjects—1st, the practice of proprietary and occupancy tenure-holders in respect of carrying out material improvements, and the effect on such practice of the nature of the tenure and the wealth and poverty of the holders; 2nd, the operation and effect of recent Land Improvement Acts, and the necessity or desirability of altering them, so as to enlarge their scope and facilitate their operations. The first subject may most conveniently be treated by divisions.

Kumaun Division.—In the Kumaun district proprietors and tenants of both classes frequently make irrigation channels from streams and rivulets at their own expense. Persons to be benefited often give large sums and also their own labour for the purpose. In Garhwál a similar practice prevails among occupancy tenants, but their action is affected by their poverty. In the Tarái district, where Government owns the proprietary right in most of the area, large sums are spent, such as advances for seed and cattle. The Superintendent makes no mention of expenditure for material improvements. The few proprietary zemindars do nothing whatever to improve.

Jhánsi Division.—In Jhánsi and Jalaun the zemindars are impoverished and apathetic as regards improvements, and Marwáris who are replacing them do not care to invest money in that way. In Jhánsi hereditary cultivators are also poor, but are more ready to improve the tract by making "bundhyas" in black soil and digging wells, though as regards the latter they are hampered by traditional custom. In Jalaun all the above tenure-holders dig wells when they can get advances, spending from their ownpurses a sum equal to the advance.

Lucknow Division.—But little appears to be done here, either by tenants or cultivators, in the way of material improvements. In Bara Banki, what little is done is limited to masonry wells. In Unao, some few landlords—but very few—do make wells; no tenant may make a lasting well without permission from his landlord; and in Lucknow the Deputy Commissioner writes that talukdars from apathy, and under proprietors and tenants from poverty, do not carry out material improvements.

Rai Bareli Division.—Wells and drains are made to a greater extent in Rai Bareli than in other districts, owing perhaps to greater pressure of population; they are made mostly by the representatives of village cosharers and seldom by tenants. Over 100 wells were made in 1870 at an average cost slightly under Rs. 200 each. Mr. Blennerhassett considers that security of tenure and possession of means are both necessary or wells to be largely made.

Colonel Perkins, Deputy Commissioner of Partabgarh, shares in this opinion, and states that wells in his district are occasionally constructed by proprietors and well-to-do tenants of all classes, but most commonly by cultivators of the industrious classes, who, though they have no legal security of tenure, enjoy from their small numbers and great rent-paying power a considerable measure of fixity.

Fyzabad Division.—In Bahraich irrigation is rarely resorted to, owing to moisture of the soil and sparse population; and in the adjoining district of Gonda improvements are more extensively made by ordinary lessees and tenants-at-will than by proprietors and sub-proprietors. Apathy and indifference on the part of the talukdar, and poverty on that of the sub-proprietors, are generally the causes assigned.

Benares Division.—*In Gházipur*—a permanently settled district—both proprietors and cultivators are said to carry out improvements in the way of digging wells.

In Mirzapur, with the exception of the Court of Wards' estates and the Mahárája of Benares, non-cultivating proprietors do not carry out improvements. Cultivating proprietors in the ultramontane tracts, and occupancy tenants throughout the district, habitually endeavour, as far as their means will permit, to improve their holdings by the construction of wells, embankments, and tanks. The Collector states that he has found, as a matter of experience, that, without security of tenure, cultivators will not make improvements.

In Benares the consent of the zemindar is held to be necessary for digging wells by all tenants except tenants at fixed rates. Resident zemindars give such

CHAP.I. Q.N.11.

NORTH-WESTERN PROVINCES AND OUDH.

Mr. Quinton.

consent readily, but non-resident zemindars of the baniya class do not easily consent to the construction of a well without a *quid pro quo.*

In Gorakhpur the number of tanks or other irrigation works completed annually from private capital is said to be small. "The Gorakhpur zemindar is not much of an improver."

MEERUT DIVISION.—The Collector of Muzaffarnagar writes that, as a rule, neither proprietors nor cultivators are very ready to spend money upon wells or other improvements, while the Collector of Meerut states that proprietors who are tolerably free from debt, and have a property of fair size, are always ready to make wells. Long and expensive channels for irrigation are very seldom attempted by proprietors from their own resources.

Petty co-parcenary proprietors in Meerut have no incentive to make improvements, and occupancy tenants are never allowed to dig a pucka well through the desire of the zemindars to drive them into difficulties and force them to abandon their tenures.

AGRA DIVISION.—In *Muttra and Farukhabad* proprietors and tenants are said to dig wells and irrigation channels, and similar improvements are made in Etâwah by tenants with rights of occupancy, who form a large per-centage of the tenants throughout that district.

ROHILKHAND DIVISION. *Budaun.*—In most of the villages, except the bhúr tract, tenants, with the consent of the landlords, are in the habit of digging kucha wells, the average depth of water from the surface being 20 feet, and the cost of digging such a well being Rs. 6. When water is deeper masonry wells are rarely made, owing partly to poverty of proprietors and partly to objection of tenants to pay enhanced rent, whether they use the water or not.

In Moradabad, Mr. Alexander, the settlement officer, writes that, as a general rule, neither the proprietors nor the tenants carry out material improvements, except the digging of pucka wells for the sugarcane field, which is done by the tenants. In Bijnor the same state of things exists. Mr. A. Colvin writes: "The habits of generations discourage enterprise; so " does the coparcenary tenure and the prevailing " absence of capital. Kucha wells can be so easily " dug that the want of others is not felt."

ALLAHABAD DIVISION.—Cawnpore landlords and tenants do not care to waste capital in improvements unless driven to do so. Irrigation channels are constantly dug under the Northern Indian Canal Act, and the delay of the Irrigation Department in deciding how far canals are to be extended or modified discourages the construction of wells.

Bánda.—In the Karwi subdivision Mr. Rose writes that improvements are seldom carried out by any class of tenants. Black soil and water 80 to 100 feet from the surface prohibit the construction of wells. The only mode in which improvements are carried out is by embankments, and the localities are limited in which these can be made. They are as a rule constructed by cultivating landlords or tenants with a right of occupancy.

District officers are unanimous that security of tenure and wealth, or, at least, easy circumstances are equally indispensable conditions for effecting material improvements. The Collectors of Cawnpore and Meerut give further special reasons, above stated, why wells are not more extensively dug in their districts; and Mr. H. Harington, Deputy Commissioner of Unao, suspects the greatest check to improvements to be the feeling that at the termination of the existing settlement the benefit of these would be shared with Government. Other officers, however, consider such a feeling to have no practical effect in deterring landholders from making improvements. Mr. H. Harington adds: "At present agriculture is a means of life " rather than a profitable investment of capital. The " intelligence of commerce has not yet permeated to the depths of the bucolic mind." Mr. Watts of Farukhabad suggests as another reason which hinders such investments of labour and capital the proverbial apathy and ignorance, and the crass conservatism opposed to all innovation, of the agricultural class; and Mr. Alexander, in para. 31 of the answers from Moradabad, enumerates several other causes arising from the peculiar character of the population of that district.

As to the second branch of the question, district officers are also unanimous that the Land Improvement Acts have had little or no effect. No reply has been given to the question as to whether they have tended to enlarge or narrow the making of advances by Government. Most agree that the operation of the Acts should be facilitated, and point out difficulties for removal.

The difficulties which at present hinder the working of the Acts are—(1) the minuteness and expense of the initial procedure before an application can be acceded to. For instance, the delay and vexation of the preliminary local inquiry, the execution and registration of a bond, the cost of the stamp, and the worry of dancing attendance at courts and offices till these operations have been completed, when the mahájan is ready to advance money, doubtless at higher interest, which does not much concern the borrower, without any of these inquisitive formalities.

(2.) *The demand for security.*—This is a great obstacle. Persons with good credit have no difficulty in getting money from the village banker without trouble; so that the only customers left for Government are those whose credit is shaken, who have difficulty in giving security, and without security Government will not lend.

(3.) *The rigidity of the rules for repayment by instalments on fixed dates.*—The mahájan will allow the amount to run on and take sums on account when the debtor can give them; but no such leniency can be shown by the tahsíldar, whose efficiency is estimated by his success in punctually realising the Government demand. It not unfrequently happens that a well has failed from some imperfection in the site or defect in construction, and for such cause no allowances are made.

(4.) Another cause assigned is that in coparcenary communities, shareholders cannot agree as to the proportion in which the water is to be divided.

On the question of the demand for interest being obstructive opinions are divided. The majority of officers hold that it has no obstructive effect. The Collector of Benares (Mr. Church) is of a contrary opinion. Mr. Sandys, of Budaun, would reduce the rate to 4 per cent.

The officiating collector of Meerut states that obstacles are too readily thrown in the way of applications by the native officials, from whom, in case of advances, incessant watchfulness is required to prevent the money being applied to other purposes. He thinks that a per-centage granted to the tahsíldar might have a beneficial effect, and the settlement officer of Moradabad is of opinion that a successful working of the Act cannot be looked for until a special officer is deputed to superintend it, travelling about the districts the greater part of the year and finding out the persons who are fit to receive advances, and making generally known the terms on which they will be granted.

The Deputy Commissioner of Jalaun recommends that the scope of the Act should be enlarged by granting advances for the purchase of seed and plough bullocks; and Major de Montmorency (Bahraich) believes that "by the systematic apportionment of a " district into groups of villages, by restricting " advances for the construction of wells within each " such group until its requirements were satisfied, and " by employing at the rateable charge of the borrowers " a few skilled well men to superintend the most difficult " part of the operation of well sinking, something

CHAP. I. QN.1

NORTH-WESTERN PROVINCES AND OUDH.

Mr. Quinton.

" more effectual would result than from the existing " desultory system of granting takávi to scattered " parts of the district where the revenue officials " cannot maintain a continuous and effective super- " vision."

The Collector of Bareilly would make advances to landlords without interest for the purpose of sinking masonry wells, merely as a slight safeguard against drought, but considers it useless to attempt to induce tenants to sink capital in improvements, as the greater part of the profits will infallibly be taken by money-lenders. The rainfall in his district is generally so ample that he doubts if it would pay to increase irrigation to any great extent.

Mr. Rose, from Karwi, is of opinion that the Act should allow advances to tenants as well as to landlords, and that thereby more land out of cultivation would be brought under the plough. The rate of interest should be lowered and the procedure simplified. Mr. J. Simson notes that the latter is a specially important point, and that the present rules are far too cumbrous and detailed.

The Board of Revenue.

6. The Board consider (as they have always held) that the demand of a high rate of interest is the greatest deterrent to borrowers. They would make interest payable only on instalments which are in arrears, reducing the 12 per cent. of the Board's Circular IV. of 1841 (para. 29) to 6 per cent.

7. Perhaps an equally powerful deterrent is the provision in section 15, Act XXVI., 1871, to the effect that an arrear of takávi shall be recoverable as if it were an arrear of revenue due on the land. Two or three bad seasons following the year in which takávi repayments commence may make it impossible for the zamindar to pay up his instalment. He is told, if he fails to pay punctually, he may lose his land altogether.

8. The Board do not think it would be fair to attribute the "non-efficiency of the recent Act" either to want of activity on the part of Collectors or of their subordinates in urging such loans and informing the people thereof. The Collector, while he "urges such loans," must in common honesty inform the people that they will have to pay 6¼ per cent. interest on the amount advanced, and that if they do not pay their instalment, their land may be sold for recovery of the arrear. The Senior Member has been met, when urging zamindars to take advances, by the objection that they have to pay interest, and they had rather get the money at much higher interest from their mahájan than run the risk of being treated as land-revenue defaulters.

9. Nor does it seem fair to attribute the failure of the Act to the opposition of tahsíldars when the reasons for its failure are shown to be contained in the Act itself.

10. The indebtedness of the people is not a new cause of hindrance, and is of course a great bar to any improvement to be effected by the people, either directly at their own cost or by loans from Government or others. This is one of the main arguments in favour of a compulsory system.

11. The records of their office do not enable the Board to get any satisfactory statement of takávi advances to show the decrease due to the Act and rules thereunder. A statement is, however, enclosed which will show the sums advanced from 1857–58 to the end of the revenue year 1877–78.

BENGAL.

BENGAL.

Ir. Toynbee.

Holders of tenures in Bengal of the nature of those described in the previous paragraph have never been in the habit of carrying out improvements in the lands they hold. Their sole idea of any advance in this direction is the extension of cultivation to lands not hitherto cultivated, not the improvement of those already under cultivation. The former procedure is in accordance with their rigid and inflexible law of custom, the latter is not. The increasing pressure of the population on the soil works in the same direction. They are content to live and to cultivate as their ancestors did before them. The bulk of the cultivation in Bengal is that of rice-lands, and it is exceedingly difficult to say how, in the great low-lying, rice-bearing tracts, any such material improvement, such as is indicated in question 11, would be feasible. In most years the rains of heaven suffice for all the wants of the cultivators. Tanks and wells would only run dry in dry seasons. Even where they exist, they are never used for rice irrigation. In the purely rice-growing tracts of Bengal, therefore, improvements could only be effected in the shape of large projects of insurance by means of irrigation, which, even if feasible from an engineering, would certainly be impossible from a financial, point of view. In Behar and in parts of Chota Nagpore, where *bhadoi* and *rabi* crops are grown, the improvements indicated in question 11 are, to some extent, carried out. In the Sonthal Pergunnahs and other hilly tracts, small streams are bunded up, and water is thus collected for the rice grown on lower-lying lands. In south Behar there is a system of collecting surplus rain and river water into reservoirs and using it when the rains fail. For dry cultivation, wells are dug when the nature of the soil permits. But whatever is done is done according to the custom of the country handed down from time immemorial. No new line is struck out. All the improvements mentioned above are on a small scale and generally limited to one village or one estate. There is no power of combination among either landlords or tenants either of the same or of different estates to work together for the common good. There is no energy or enterprise to act as an incentive to improvement; every cultivator is content to live as his fathers lived before him. Landlords and middlemen are merely rent-collectors; they take no interest in their estates or tenures. If any improvements were feasible, it would be necessary to look to the actual cultivator for them. Insecurity of tenure and fear of enhancement of rent act as a bar to the digging of wells, the only improvement within the means of the individual cultivator. But on the other hand it cannot be said that those whose tenures are protected by law are much more ready to improve their lands than others. Wealth and poverty hardly affect the question. Those who have wealth prefer to spend it on social and religious ceremonies. Those who have not, have no care beyond the daily provision of food for themselves and their families. Both classes move helplessly in the groove of custom; that custom is to take as much as possible out of the land and to give nothing back to it. It is possible that as the pressure of the population on the soil increases, and as the margin of cultivation advances, necessity will hereafter compel the people to adopt an improved system of agriculture, assuming for the sake of argument that the present system is not the best that the circumstances of the country render possible. Nothing but necessity can overcome their present indifference, and if in times of distress the people are to come on the hands of the State this indifference will tend rather to increase than to diminish.

The Land Improvement Act has been practically a dead-letter in these Provinces. In the year 1876–77 only Rs. 975 were advanced, and in 1877–78 only Rs. 459 in the whole of Bengal. In the famine of 1874 large advances were made under the Act, but neither its letter nor its spirit were complied with, and the money was devoted to purposes quite foreign to the improvement of the land, unless the saving of the lives of those who cultivate it can be so called. The advances are not wanted, or they would be taken. The procedure is somewhat elaborate, but, on the other hand, if it were not so, there would be the fear of advances not being applied to the objects for which they were ostensibly granted. The rate of interest charged by Government is far lower than that paid on loans from mahâjans and others, and cannot in any way be said to be prohibitory. But there is this difference in the favour of borrowing from the latter, that he is not inflexible in his demand for punctual repayment in strict accordance with the agreement, and will, if necessary, accept payment in kind. The Government has all the machinery of the law at its back to enable it to recover the sum advanced; the costliness of the law for the private lender makes him prefer the customary mode of renewing the loan on payment of a consideration. Generally it may be said that the Land Improvement Act is not required for these Provinces, because the people have not the slightest desire to avail themselves of it, and because if they had, the objects on which the money could be expended so as to yield a fair return are either not known or do not exist.

CENTRAL PROVINCES.

CENTRAL PROVINCES.

Mr. Nicholls.

The opinions of far more experienced and able officers of the Commission are happily available in discussing these questions, but I trust the deep interest I feel in the subject will be held to excuse my offering my views on them.

We have no canals from whence to draw water. Channels from rivers are, I may say, unknown.

Tanks are constructed just as often by non-agriculturists, men of wealth, for "dharm," as by agriculturists. Tanks would generally be beyond the means of ryots or villagers other than malguzars. Wells also are constructed without regard to agricultural prospects. Open fields would hardly be converted into embanked fields by others than those possessed of proprietary or occupancy rights or tenants-at-will holding long leases, with fair prospects of not being harassed, by reason of their possessing more valuable fields, into relinquishing their holdings.

Waste lands, again, are almost always brought into cultivation under "pagras" leases or special agreements. Permanency of high rates for produce and pressure of population will determine the advance of the area of regular cultivation.

Question.—Are their actions in this respect affected most by the security or insecurity of their tenure or by their wealth or poverty?

The poor man, whatever tenure he may enjoy, cannot lay out the necessary capital. The wealthy man with a secure tenure is more likely to effect a permanent improvement by making a tank or sinking a well or embanking his fields; as he probably knows the value of wealth, he prefers an immediately reproductive outlay and benefit for his fields.

The wealthy man with an insecure title who wishes to perform an act of merit in his village is, I think, more likely to plant a tree, or clump of trees, or a grove.

Are there any other reasons which hinder such investments of their labour and capital?

For an answer to this question we must look to the past political and fiscal history of our country. The effects of the ravages of the Pindharis have lasted longer on the minds of the people than on the face of

Chap. I. Qn.

Central Provinces.

Mr. Nichol.

the earth, and the oppressions of the later days of the Mahratta power, I think, still check to an appreciable extent the employment of capital, and tend to make it against the "custom of the country" to lay out money merely for the sake of improvements. To have done such a thing, not so very many years ago, would have been almost suicidal. The history of the Nerbudda valley shows this clearly.

I think that the custom and desire to keep wealth in a form in which it could be removed or hidden, and the great disinclination to tell even what had been the produce of their fields was rendered almost hereditary among the people by the wretchedness of those times, and to the present day they have not acquired sufficient confidence in the stability and long enough experience of the high principles of Government to counterbalance all these traditional and habitual restraining influences and induce them freely to lay out their own capital to any considerable extent in permanent improvements to the land, at least, on works of more permanence than field embankments. In this, I limit myself to cases where religious feelings have no share in influencing the cultivator's employment of his surplus cash.

To this inherent dislike to spend money openly and to lock up capital in unconvertible masonry or earthwork there are other considerations to be added. The great majority of the people have not the means, or, if they have the means, are too apathetic to take steps for increasing the yield of their fields, or like Mr. Elliott's true *kirsan* of Hoshangabad only look with pride to broad acres, and think permanent improvements and manuring and irrigation as little peddling matters. The expanse of our lands compared with the paucity of cultivators, coupled with low prices from want of outlets for our superfluous produce hitherto have not necessitated their looking out for new and expensive means for increasing the produce of their fields. A man with a surplus of cash will look out for more land, or will buy more cattle, rather than lock up his capital in permanent works.

In Chhattisgarh, in addition to all these deterrent influences, is to be superadded the insecurity for investments in land, where the custom of shifting tenures exists or might be revived. On the whole, I am inclined to think that it will take a long time before these causes cease to have effect, before the agricultural classes will lay out much capital on petty irrigation works, actuated thereto solely by a desire to increase the yield of their lands. Individual cases of more enterprising and more industrious men, especially of the Mali, Kachi, Ponwar, Bhori, and Kori (of Bhandara) castes will no doubt come to notice, and so will those in which tenants-at-will, having confidence in the generosity of their landholders, invest their savings in the irrigation of their fields.

But at present the incentives of permanent high rates with brisk markets for produce, and pressure of population, have not come into general operation.

Effect of recent Land Improvement Acts :—

I show the figures for many years past.

1865-66 - -	26,530	
1866-67 - -	34,675	
1867-68 - -	21,550	
1868-69 - -	77,380	Famine years.
1869-70 - -	146,213	
1870-71 - -	14,375	
1871-72 - -	6,775	The law came into operation in 1871-72, Act XXVI. of 1871.
1872-73 - -	21,875	
1873-74 - -		
1874-75 - -		
1875-76 - -	3,120	
1876-77 - -	2,940	
1877-78 - -	7,515	

It would thus appear that the sums now advanced for the permanent improvement of lands have dwindled very greatly, and in the past year nearly all of the advances were made in Chanda, Saugor, and Balaghat.

When we had no intricate formalities to go through, no delays in giving out advances, and not so much trouble with stamps and registration, and especially when we had no summary method of realising arrears, we made no bad debts, and the intentions of Government were more adequately responded to. But the fact is that Government is thought to be a hard creditor, and in addition to the perhaps needless worry at Cutcherry before the money is advanced, and the minute inquiries in his village, the borrower is haunted by the anticipation that if he should not pay up on the exact day fixed, or the next day, he is liable practically to arrest in the most public and obnoxious way. A money lender on the other hand would give time, or at the worst would have to proceed by regular suit in the civil court, and this is the chief reason why the people are now positively reluctant to apply for loans from Government, except when they find the Deputy Commissioner for the time being is especially interested in this matter. The over ingenuity of the Act and the first set of rules strangled it. I think all that is necessary is a simple application coming from a cultivator or proprietor of good character, an assurance that the village proprietors and people have no objection, and reasonable security, such as the sanctioning authority might be satisfied with. In the ordinary course of events it would be found out if the loan had been misapplied. Should this be the case the refund should be required after two or three months' notice, and arrest or *quasi* arrest should not be resorted to. For the security bond, which should be made as simple as possible, I think the Government of India might specially exempt such deed from stamp duty and registration, and that Deputy Commissioners, subject to the rendition of proper reports, so long as the security continued satisfactory, should have a large discretion in allowing a period of grace or deferring the payment of an instalment, and that neither the person or property of the debtor should be touched till after the surety had received notice of not less than a month to arrange matters with the Deputy Commissioner, or if more convenient, at the Tahsili.

I think this would make such loans as popular as they now are unpopular.

It is to provide for times of famine that many cultivators and Malguzars, perfectly solvent, like to keep their names on the debtor's side in the books of Mahájans who are known to hold stocks. I am inclined to think that a distinction might be well made in cases where we lend money to purchase seed, grain, and cattle in famine and in panic times. We have always required very prompt payment. Where there are prior liabilities and existing liens this must be insisted on, but, when the time of payment comes, famine and panic having passed away, and mutual trust and interests having again re-established the debtor's credit, then if the debtor can give good security, I see no reason why the debt should not be made repayable over some two or more years.

I think the scope of the Act is wide enough, but that the rules are troublesome and impede its utility.

I think as a provision against famine and as a material improvement to the country at large, it is highly desirable that the operation of these Acts should be facilitated.—*First*, there would be the direct return from the capital thus laid out. *Secondly*, the example of Government proving its confidence in its own stability and progress and in the wisdom of such undertakings would bring private capital into the same field. *Thirdly*, there would result a general tendency to a lowering of the traditional and customary rates of interest charged to agriculturalists.

The foregoing answers indicate my opinion that the law does not check the permanent improvement of the land nor expectations of future enhancement of the revenue assessment. There may be, and probably is, some slight check more in individual cases than as a general condition of the country, owing to apprehensions of indirect pressure and of enhancement of rents, cut the determining cause is the ability or inability to bommand and apply capital.

HAP. I. QN.11.
CENTRAL PROVINCES.
Ir. Nicholls.

The digging of a well and the planting of a tree rank only as meritorious actions, after the begetting of a son, with a view to future life. It follows that many wells are dug without regard to the improvement of the adjacent lands and of rent and the incidents of tenures.

For purely agricultural wells uncertainty of tenure may act as a check.

The Saharanpur settlement rules regarding the digging of wells are embodied in the Wajib-ul-arz, or village administration paper.

For example, in the Hoshangabad district, the clause runs thus:—

Rights to wells, "All vested rights in wells now "existing shall be maintained and preserved. If any "person now owning a well shall give up his land or "shall be ousted in default of payment of rent, or "shall die without heirs, the wells shall become the "property of us, the Zamindars. In future any cul-"tivator may without our permission dig wells in his "own land, but he shall have no interest in the wells "as soon as he loses his interest in the land in which "it is dug. Since no irrigation is now carried out, "we will advise and persuade the cultivators to adopt "the system of irrigating their fields."

When a landholder elects to purchase, under his right of pre-emption, the holding of an absolute occupancy ryot by giving him the equivalent of five years' rental, the ryot is entitled also to receive full value without interest of all permanent improvements effected solely by the ryot subsequent to the fixation of rent.

The occupancy ryot is protected against enhancement of rent on account of his lands having been permanently improved by him, under the provisions of Act X. of 1859.

If he or the absolute occupancy ryot suffers himself to be ousted for arrears of rent, he gets no compensation. In Nimar and Chanda the recorded absolute occupancy tenant cannot transfer or mortgage, but has *a right to receive a compensation* for improvements, when ejected, and may transfer to any person so much of his holding as may be affected by or cannot be properly separated from land affected by such improvements, together with his right to compensation on ejectment. The person to whom land may be transferred under this rule will hold as a tenant-at-will, unless the tenant from whom he received such land held under an unexpired lease which he could transfer, or possessed a transferable right of occupancy, and shall have transferred the lease or occupancy right also.

An absolute occupancy ryot can also transfer to a co-sharer by inheritance, or to a person who at the tenant's death would inherit the land.

In Chhattisgarh much good has been effected within the last 14 years by grants by Government of rent-free plots to persons who construct roadside and village drinking wells or establish roadside groves of specified dimensions. But these measures have been adopted for the convenience of travellers, and on sanitary, not agricultural grounds.

As for anticipations of increase of the revenue demands, in the first place, our settlements as yet have a long term to run; secondly, the people have faith in the moderation of Government. Therefore I think that there is no limiting of the execution of permanent improvements on this score.

As for increase of rent, Malguzars for their *sir* lands, and proprietors of holdings (Malik Makbuzas) and Maafidars, and generally service holders, pay none; absolute occupancy ryots are not liable to increase of rent for the term of settlement; conditional occupancy tenants are, I think, in this respect, fairly protected by law. Only in case of a repetition of the story of Naboth's vineyard are they in danger. Improvements to their lands might tend to increase their danger of losing their rights, not by legal process, but by indirect ways. The Malguzar, if powerful, can make it very uncomfortable for any villager, to retain what he considers adverse rights, and practically, the only things to support the ryot exposed to indirect pressure are such public opinion as exists, the discountenance of Government officials, and the support of a money lender. Reckoning on his own solvency, on a long lease, or such supports, and the personal character of the Malguzar, of the Malguzar's family, or of some of the co-sharers in the malguzari, a tenant-at-will may exceptionally undertake a work of permanent improvement, but generally he will be influenced by other considerations than hopes of enjoying adequate returns for his outlay.

Mr.
arles Grant.

The official returns, quoted by Mr. Nicholls, show what is notoriously the fact, that little recourse is had to the Government for loans under the Land Improvement Acts. The cause assigned for the indifference of the people to the advantages held out to them is that, though the terms on which the Government lends money are far more moderate than those obtainable in the open market, they are in some respects more onerous; for the main object of the private money-lender being to attract customers, and keep them in his books, everything is made easy for them till the time comes to sell them up; whilst, as the Government, on the other hand, lends money solely for the purpose of improving the economical condition of the people, it is bound to see that its advances are legitimately applied and regularly repaid, even at the cost of some friction. Further, even if the poorer cultivators had sufficient regard for their own interests to prefer immediate trouble to the risk of future ruin, they would often fear to lose the support of local capitalists, on which they now count in times of difficulty, by seeking loans from other sources. The substitution of some less injurious agency for private bankers who now "finance" agricultural operations throughout the greater part of the country opens out questions too large to be discussed here, and is beset, moreover, by serious political, as well as economical, difficulties. But something might, no doubt, be done to simplify the distribution of loans for actual improvements. The initial difficulty is, of course, to guard against the risk of advances, taken ostensibly for these purposes, being applied to other uses; as, for instance, a sum of money borrowed for a well being spent on a marriage. In order to prevent funds intended to aid improvements from being used to foster waste, the Government is obliged to hedge round its advances with checks and precautions; and as the machinery by which effect is given to the necessary formalities, is over-taxed and sometimes over-centralised, a Government loan is attended by so much delay at first, and so many restrictions subsequently, as to make it little desired. In this, as in other "non-regulation" Provinces, the principle of administration is to combine executive and judicial functions in the same official; and probably no one who understands the condition of the country and of the people, will dispute the advantages of the existing system. But as time has gone on, the work of the courts has enormously increased, and many of those entrusted with the administrative management of the country, are little better than slaves to the Bench. The Administration is doing what it can by savings and re-arrangement to relieve the pressure where it is greatest; but we shall very soon have reached the limits of economical re-adjustment; and must either increase our establishments or content ourselves with a rougher and simpler standard of work.

In the case now under discussion the alternative would, I think, be between entrusting the distribution of agricultural loans to a special agency, or making up our minds to submit to occasional loss and malversation. So long as advances are only available through Tahsildars, who, however much we may try to relieve them, will always be very fully occupied, CHAP. I. ON

CENTRAL PROVINCE

Mr. Charles Gr

and who, living far as they do from any supervising authority, often conduct public business loosely and irregularly, it is impossible to hope that the local inquiries necessary to satisfy the Government of the good faith and solvency of the applicant will be promptly and smoothly made, and that there may not be instances of unreasoning pressure in exacting repayment. Both the preliminary inquiry, and the subsequent dealings with the borrower, require time and judgment, which an already overworked Tahsildar is often not in a position to give. Possibly the duty of superintending agricultural advances might be undertaken by the special officers, whom there has been a question of appointing in this Province (and who have, I believe, been appointed in Oudh), for the management of estates belonging to minors or embarrassed landholders, and for the time being under the charge of the Collector. One great difficulty in creating these appointments has hitherto been that the cost of maintaining them would diminish the chance of redeeming encumbrances on estates taken over simply to free them from debt. But if part of these charges were debited to management of an agricultural advance fund, both objects, viz., the free diffusion of agricultural loans and the efficient management, at a comparatively low rate, of encumbered estates, would be to some extent attained.

The only other alternative would be to provide that officers of all grades, down to that of Tahsildar, should keep the subject of agricultural loans prominently in view on their periodical tours, and should be supplied with funds, and otherwise empowered to make immediate advances to approved applicants. Any such system would be open to many obvious risks, as, for instance, that there would be a diversity of practice, and that loans would be therefore irregularly distributed, that they would not be available throughout the year, but only when chance or the exigencies of the service brought an official in the direction of the applicant's village, and that, if loans are to be more easily made than at present, unpractised officials might sometimes be taken in. But I think the last of these dangers would be also the least. There is probably still enough respect in the country districts for the central power to prevent general or even frequent attempts to impose on an officer of Government, brought face to face with the applicant. Under such circumstances it is probable that loans would rarely be taken without a more or less unreserved intention to apply the whole or part of them to their ostensible purposes; and in most cases there would probably be little subsequent deviation from original intentions. There would perhaps be more danger of repayments falling into arrear, or even altogether failing, if present safeguards were relaxed, though they might be partly replaced by increased personal supervision both in granting and in recovering loans. But this again implies heavier calls on the time of the supervising officials, and leads back to the conclusion that a system of Government advances to agriculturists can never be successful or popular until it is worked by separate officials, having time enough to dispense with paper checks, and to treat directly with borrowers.

BERAR.

BERAR

Mr. Dunl

Lieut.-Col. Menzies.—Amraoti.—" Those who hold garden lands improve their holding. In addition to clearing out old wells, I estimate that from 75 to 100 new wells are annually sunk."

Major Mackenzie.—Ellichpur.—" Very few holders of land carry out improvements, such as digging wells, &c., it being asserted that on a revision of assessments such improvements would be overlooked, and the ryots charged with the higher or garden rates."

Major Szezepanski.—Wun.—" Hitherto it has only been rarely that holders of land have attempted to improve their land by digging wells and channels, but since the introduction of the new rules prescribed by the Resident under the provisions of the Land Improvement Act, there is more inclination to do so."

It is well known that a great many new wells have been made in the Akola District during the last ten years, but statistics on this point are not available.

In the Jalgaon Taluka, at the time of the settlement in 1865, there were 1,860 wells in excellent order. The area of the taluka is 419 square miles, which gives an average of more than four wells to every square mile.

It would appear from Major Mackenzie's reply that the conditions of the settlement are not properly understood in the Ellichpur District. Rule I. of the settlement rules, which refers to the point in question, runs thus:—

" With a view to the improvement of the country and people, the assessment now introduced by the Superintendent, Revenue Survey, has been fixed by Government for a period of 30 years, during which period the full benefit of every improvement, such as the conversion of dry into irrigated land, by the digging or repairing of wells or tanks, the planting of fruit trees, &c., will be secured to the incumbent of the land, and no extra assessment levied on that account. A revised assessment may be made at any time after the expiry of the present settlement. Such revised assessment shall be fixed, *not with reference to improvements made by the owners or occupants from private capital and resources during the currency of any settlement, but with reference to general considerations of the value of land whether as to soil or climate, prices of produce or facilities of communication.*"

The words in italics show that due provision has been made to secure hereafter to landholders the benefits of all improvements effected by the expenditure of their private capital, and my own experience in the Akola and Amraoti districts is, that these conditions are generally understood by the people.

I agree with Major Mackenzie in holding that one great reason why more improvements are not made is that cotton and jowari do not require irrigation. There is no inducement to landholders generally to convert their cotton fields into garden-lands. Garden produce requires much labour and attention, and *the demand for it is limited;* while, on the other hand, cotton is easily cultivated, and can be sold in the established markets on any day and to any extent.

In his report on the Mekhar district, Major Elphinstone mentions the following reason against irrigation in that district from the Penganga river:—

" The natives look upon this (the Penganga) as a holy river, and venerate it almost as much as they do its namesake the " holy Ganges," in Bengal. The idea of damming it up, or creating any works that could in any way interfere with its flow, seemed to them almost sacrilegious. There are many spots at which a small dam could be advantageously created, and but for some religious prejudices on the part of the natives, it would be difficult to account for their not having done so themselves. The expense would have been but trifling. At the town of Mekhar a dam could be easily thrown across this river, and a good deal of land brought under cultivation. Even at the end of January there was a good flow of water in the river.

Lieut.-Colonel Menzies.—Amraoti.—" Taccavi advances are rarely asked for, and the formalities to be gone through before they are obtained rather discourage applications for them. They are cheifly needed to improve the water supply, and the villagers prefer carrying out works badly, at a great waste of money, to permitting the employment of professional engineers. Schemes for works get so bandied about, that much time is lost and interest in them cools down,

AP.I. QN.11.

BERAR.

budget allotments lapse, and files of correspondence accumulate, while no results follow.”

Major Szczepanksi.—*Wun.*—“The people are deterred from availing themselves of advances under the Land Improvement Act; 1st, by the difficulty, owing to their impoverished condition, of furnishing securities; 2nd, by the intricate, tedious, and unintelligible procedure which has to be gone through before the advance can be obtained; 3rd, being indebted to and in the power of the sowcars, they are not allowed to become debtors elsewhere.”

Major Mackenzie.—*Ellichpur.*—“The object of the Act has been widely made known to the people, but the applications have been almost *nil.*”

Before the introduction of the Land Improvement Act we never gave any advances to the people, so that the Act has not in any way tended to narrow such transactions.

Another reason why Government advances are not more generally applied for is, I think, that agriculturists dislike, and are afraid of, the fixity of our rules for repayment by instalments. Instalments must be repaid on the specified dates, any failure to do so rendering the defaulter liable to be sold up. But in dealing with the Marwadi money-lender the agriculturist knows that a little more interest, a fresh bond, or a small payment to account, will enable him to tide over his difficulty for a time.

BOMBAY.

BOMBAY.

Mr. J. B. Peile.

The following is a summary of the opinions of the officers consulted :—

Kaira.—The holders in question dig wells, but attempt no other works. They believe in the security of their tenure, but are prevented from doing more by want of means. They have not sufficient energy or education to avail themselves of the advantages of the Land Improvement Acts. The demand for interest on Government advances is not obstructive or prohibitory.

Thana.—No special improvements under any tenure. Action is not impeded by insecurity of tenure. Some men of capital have lately invested it in reclaiming lands from the salt marshes. The Land Improvement Acts have not been taken advantage of. Tuccavi advances of small sums without interest are allowed only to certain wild tribes, but should be extended, as the cultivators are driven to the Saucar for small loans. The Land Improvement Acts are suitable for men of position, but the ordinary cultivator wants a small advance at nominal interest without trouble.

Khandesh.—Holders who are well off or energetic do improve their lands. Poverty rather than insecurity of tenure prevents cultivators from sinking wells and other improvements. The number of applications for loans under the Land Improvement Act is increasing. The conditions of the Act are not too stringent if the borrower is solvent and hard working. The interest is a little obstructive and might be reduced from 6¼ to 5 per cent.

Nassick.—The holders are alive to the benefits of irrigation, and dig wells yearly and feed irrigation channels by dams built by themselves. Their efforts are limited by poverty, not by the tenure, which is secure in all cases. The Land Improvement Acts have not been much used, owing to the number of formalities and difficulty about security. The interest is low compared to that charged by money-lenders, but the ryot dislikes the punctual repayment enforced.

Sholapur.—Wells are dug and fields banked and levelled. The tenure would be considered quite secure if there were a recognised limit to the increase of rent at the end of the settlements. Advances under the Land Improvement Act are increasing. The interest is not too high.

Kaladgi.—Holders of all kinds dig wells, make channels, and embank fields as their means permit. No holders are deterred by insecurity of tenure. The Land Improvement Act is seldom taken advantage of. The interest is not prohibitive, being below the current rate.

Canara.—The mulgars do little in the way of improvements, and their tenants no more. The Land Improvement Acts are not used. The interest is less than the current rate, but the punctual repayment deters, and the Saucar, who will wait, is preferred.

Satara.—Wells are dug and the people seem alive to their utility. There are very few canals. Where they exist, the people use their water freely. Where wells and channels are not dug, the cause is poverty rather than the insecurity of tenure, which is secure enough. The machinery of the Land Improvement Act is too intricate to be popular. The rate of interest is not prohibitory, but the nature of the security is obstructive. The Mamlutdar should personally inquire who want loans, and the security of the village officers should be accepted.

Ratnagiri.—Combined with peaceful times, the khoti tenure has certainly benefited the Concan. *Vast areas of culturable land have actually been made by the khotes or their tenants aided by them.* Hundreds of acres of salt swamps have been converted into valuable rice lands, and thousands more await capital. The Land Improvement Act has been hitherto inoperative in Ratnagiri. If it is not to remain a dead letter, the rules for granting loans under it must be considerably relaxed. The boon offered is surrounded by a fence of harassing, irksome, and tedious formalities. The prospect of having to pay an enhanced rent for improvements, does not deter the superior holder in this district.

---

ol. W. C. nderson.

The holders of all lands in the Bombay Presidency are in the habit of digging wells for irrigation in all localities where it is practicable. Every day sees the digging of new wells going on. The tenure of land afforded by Bombay Act I. of 1865 affords the fullest security from additional taxation for all improvements on his own land effected at the ryot’s own cost, so long as he does not apply them to interference with the property of others or of Government. Regarding the working of the Land Improvement Act I have no personal experience. But I believe that the people recoil from the idea of involving themselves in money transactions with Government, which is no more than what I should expect.

---

r. W. G Pedder.

Details regarding the working of the Land Improvement Act will, doubtless, be supplied by the Collectors. Speaking generally, I believe that Government advances are taken advantage of to a very small extent to effect improvements, and this certainly not on account of the rate of interest charged, which, compared with that commonly paid for similar loans to saucars, is almost nominal. It is very difficult to say why the people do not more largely avail themselves of the facilities Government offer for making permanent improvements on reasonable terms. Some officers think that this arises from fear of the landowner to offend the money-lenders by borrowing from Government; some from reluctance to place himself under an obligation to Government or its subordinate officers; some from a feeling, certainly common among the Hindu peasantry, which leads them to prefer, to much more favourable terms which they know they must fulfil punctually, far harder ones which they think there may be some chance of partially evading or of

BOMBAY.

Mr. W. G. Pedder.

postponing the fulfilment of. All of these causes may have some influence, but I am disposed to think that a cause already referred to has most to do with it: that the people do not care to take the trouble and risk of making improvements for the benefit of their creditors.

With regard to the construction of irrigation wells (certainly valuable as a safeguard against famine, though not an absolute protection, wells being apt to fail when most wanted, and also as increasing the productive power of the land), a plan has often struck me which it might be worth while to try.

The dry-crop assessment of land in the Deccan suitable for well irrigation may be taken at about one rupee an acre. If irrigated by a well, it would certainly fetch on the average Rs. 8 an acre rent, and this is what a saucar who advances the money for a well calculates on at least getting. Now, a two-kos well will irrigate about 7 acres (on the average of crops wanting more or less water); and the rent due to the well, extra to assessment, is thus Rs. 49 a year, or 5 per cent. on Rs. 980. The cost of a well, of course, varies very much with the nature of the rock, the depth of water, &c. But I have usually found builders willing to take a contract for the construction of a two-kos well for Rs. 500 to Rs. 750. Taking the higher figure, it is evident that Government might construct wells and get 5 per cent. on the outlay, even allowing that 25 per cent. of the wells (a large proportion) turn out useless. Now, it seems to me that Government might very well construct a well for a peasant on his agreeing to pay the required rent in addition to his assessment, on the condition that he might at any time buy the well off Government at cost price, plus a per-centage to cover cost of failures. It would, of course, be necessary that he should execute a transfer of his land to Government on these terms, so as to bar the lien of any other creditor on it. I understand that this system has been tried with remarkable success in the Bhaunagar State; and it might be worth the while of the Commission to obtain details from Mr. Percival or from the Durbar.

SINDH.

SINDH.

Col. Haig.

Landholders in Sindh are, of course, constantly cutting new irrigational channels of the smaller class. Canals of any size are undertaken by Government only. Wells are constructed by private individuals to the number of about 90 annually on the average. The cost of constructing a well for irrigational purposes varies from Rs. 250 to Rs. 500. The area in which wells can be profitably made is limited, consisting of a strip of land bordering on the river. Here water is near the surface and abundant. Farther from the river the well has to be sunk deeper, and the water is, of course, less abundant, and is raised at greater expense. These facts, coupled with the question of capital, limit the construction of wells. The tenure being absolutely secure, and the entire returns arising from improvements effected at private expense being guaranteed to all landholders by law, there is every inducement to the agriculturist to invest capital in such improvements as wells and canals.

MADRAS.

MADRAS.

The Board of Revenue.

In Ganjam the ryots of either Government or Zemindari lands are not in the habit of carrying out any improvements beyond making shallow tanks by throwing dams across watercourses.

In Vizagapatam much activity is reported to have been shown of late by the ryots in Government taluks in sinking private wells, which are roughly dug at a smal cost, water being found near the surface; but owing to the insecurity of their tenure the ryots in Zemindari and Inam lands hesitate to sink their capital on agricultural improvements.

From the Kistna district it is reported that between 1871–72 and 1876–77 no less than 1,000 wells have been sunk by private capital by ryots holding direct from Government, but the Zemindari ryot is deterred by the insecurity of his tenure from carrying out material improvements himself.

In Nellore the ryots and the tenants of Zemindars are said to be in the habit of carrying out material improvements, such as the digging of wells; but subtenants are not.

The Collector of Cuddapah says:—"The holders of " the tenures directly under Government (that is, " Ryotwari, Inam, Shrotriem, and Jaghir) do make " material improvements to their lands by digging " wells and channels, &c., as their tenure is secure. " In cases of sub-tenures the reverse is the case."

In Kurnool numerous wells are reported to have been sunk, and the ryots are said to be in the habit of digging wells in their lands wherever possible.

In the same way, from North Arcot the Collector writes that the great mass of the Government ryots are poor and cannot afford to dig wells at their own expense; but well-to-do ryots are in the habit of improving their lands by constructing wells and small tanks. Ryots in the Kalahasti Zemindari seldom attempt to lay out capital on any permanent improvement of their holdings, their tenure being so precarious.

The Collector of South Arcot reports that the Tahsildars of the district estimates that Rs. 3,39,027 were spent between 1871–72 and 1876–77 by Government ryots in the improvement of their private sources of irrigation. He considers that the security of the tenure under Government induces many a poor, hardworking ryot to dig a well in his land. With regard to Zemindari and similar lands he reports that there is no information on record to show what outlay has been made on improvements.

With regard to Tanjore, the Collector reports that the chief estates are lands watered by the Cauvery, and therefore supposed by their owners not to require improvements at any great cost. He also remarks, apparently of the district generally:—"Most of the " ryots are poor, and barely get enough to live from " hand to mouth." The Board read with much surprise this statement regarding the wealthiest district of the Presidency; but as ryots in Tanjore are usually called Mirassidars, the explanation seems to be that the Collector is referring to the large class of labouring tenants, of whom he elsewhere writes:—"The ryot- " wari tenants are generally Poracudies, having no " occupancy right and cultivating on behalf of the " Mirassidars. They get from twenty-five to thirty " per cent. of the gross produce as waram."

In his reply to this question, the Collector of Trichinopoly deals with sub-tenures only, and remarks that tenants of Inam and Zemindari lands scarcely ever improve their land, as they are not permitted to enjoy the benefit of such improvement without their assessment being raised.

The Collector of Madura states: "The holders of " land in this district make improvements whenever " they have money to spare, but unfortunately such " cases are very few. The tenures prevailing in the " district are not obstructive to such investments, but " poverty is in their way." The Sub-Collector says: "The holders under proprietary tenures are constantly " extending wells in all directions. We have no " canals, but where channel irrigation is possible, such " holders are only too active to take advantage of it, " whether with or without regard to others' rights.

* * * * *

IAP. I. QN. 11.

MADRAS.

'he Board of Revenue.

" Security of tenure is the great affecting cause, for " a man will expend his whole capital to provide " himself with a well in ryotwari or otherwise secure " land." He also considers the want of a proper method of examining for springs to be a great obstacle in the way of well-sinking, causing much loss of money and many disheartening failures.

The only improvement ever carried out in Coimbatore is the digging of wells. The district being chiefly ryotwari, there is no insecurity of tenure, but poverty stands in the way, as more than half the ryots pay less than Rs. 10 annual assessment, and are probably in debt far beyond the value of their lands. As many as 1330 new wells were dug, however, between 1871–72 and 1876–77 without advances under the Land Improvement Act.

The Collector of South Canara considers that in that district, with its copious and regular rain-fall, there is no scope for improvements of land on an extensive scale; proprietors and mulgeni tenants, however, carry out material improvement within the limits of their own resources, loans being seldom contracted for the purpose. More would be done if the farm-stock could be improved by the introduction of a superior breed of cattle.

The Collector of Malabar states that not much money is laid out on improvements " owing partly to " ignorance and partly to the habit of the majority of " the proprietors of rack-renting their tenants and " rejecting them without sufficient cause. In conse- " quence of the insecurity of the tenure and the in- " adequacy of the rates allowed for improvements, " arising from the present state of things, the mort- " gagee finds it his interest to get out of the landholder " during the time of his lease as much as he can, " giving back to it in the shape of manure, &c., as " little as possible."

From the above it is clear that, as might have been expected, insecurity of tenure forms an almost absolute bar to improvement, though the Collectors of Vizagapatam and Nellore report that in Zemindaris in which tanks are neglected, the ryots are driven to supplement their ruined irrigation works with wells. The extent to which insecurity of tenure prevails is indicated in the reply to the preceding question. With regard to Government ryots and others whose tenure is secure, poverty is frequently reported as limiting improvement. This is, of course, true; a man cannot carry out improvements when he has not the means to do so, but it would be a mistake to infer from this that improvements in any way keep pace with means. The contrary seems rather to be the case. Neither in the replies to this question, nor in those to question 4 is there any testimony to a desire to effect improvements being a characteristic of the Zemindars and large proprietors, and in the list given below of districts in which there are a large number of private wells in Government and Inam holdings, it will be observed that the per-centage of holdings with an assessment of less than Rs. 10 to total holdings, is almost invariably above the average for the Presidency, viz., 64·29; in other words, wells are most abundant where small holdings are most common:—

	Number of private Wells.	Per-centage of small Holdings.
North Arcot - - -	52,490	73·63
South Arcot - - -	51,468	66·79
Coimbatore - - -	47,591	70·94
Salem - - - -	33,237	73·61
Tinnevelly - - -	28,429	62·64
Cuddapah - - -	27,538	70·73
Madura - - - -	24,174	72·97

Of course the number of wells is primarily due to the low average rain-fall and other climatic conditions, and not to the number of small holdings; but the table is instructive, as tending to show that there is truth in the general impression, that the average South Indian cultivator will give both money and labour even under adverse circumstances, when he finds it absolutely necessary to do so to gain a livelihood, but not otherwise.

Prior to the recent famine the effect of the Land Improvement Act may be said to have been practically nil. During the famine the following advances were made under the Land Improvement Act of 1871:—

	Ordinary. Rs.	Famine. Rs.
1876–77 - -	4,435	44,538
1877–78 - -	1,56,367	13,67,520
Total -	1,60,802	14,12,058

But the Board have no doubt that it is desirable that the operation of the Land Improvement Act should be facilitated as much as possible, but the rules under which advances are to be made have recently been revised after much consideration, and until they have had a fair trial, the Board are not prepared to submit any further proposals for facilitating the working of the Act or enlarging its scope.

The interest charged on advance under the Land Improvement Act is 6¼ per cent., and compares so favourably with the ordinary market-rate of interest on transactions of the kind that the Board have no hesitation in stating that no ryot otherwise desirous of obtaining an advance would be deterred by a consideration of the rate of interest charged.

MYSORE.

MYSORE.

r. Ricketts.

As a broad rule landholders are not in the habit of carrying out material improvements, though in the natural course of prosperity many wells have been dug here and there. Under the native rule there were no inducements to sink wells, and the watered land was charged with water-rate, which often worked a hardship, for though the wells might subsequently have fallen or otherwise got into disuse, it was most difficult for the owner to get his land again charged as dry. It was only after the advent of Mr. Bowring, that special, or rather it should be said the usual concessions were made in the case of new wells. The survey and settlement have, however, put all this on a proper footing, and wells and the natural result, gardens, are springing up in many directions in settled taluks.

Mr. Bowring further offered inducements to private capitalists to expend money on the repairs of ruined or disused tanks. Apparently the scheme prospered at first, but it has terminated in failure owing to the glaring manner, in some cases, in which the holders tried to evade their responsibilities. In fact, though monied men, the wrong class took up the tanks. The ryots themselves held back. They were fearful of incurring heavy obligations to the Sarkar and were content to let the Sarkar take the initiative and share profits with them.

I am not in favour of making advances under the Land Improvement Act, *i.e.*, as a rule. Those that go in for improvements with borrowed money are generally of a sanguine or flighty nature, and are likely, as not, to throw up in disgust or despair even when success by perseverance and skill is almost within reach. Easily-gotten money is easily spent. The character of Indian agriculture with its cheap prices of produce is such that profits can only be made by the skilful and industrious. The maturing of these qualities will generally end in seeing the possessor with quite enough wherewith to enlarge his operations. Thus progress is gradual and healthy. The sons begin where their fathers left off, and there is none of that inherited wealth which proves oftener

Chap. I. Qn. I
Mysore.
Mr. Ricketts.

a curse than a blessing. I would not, of course, check improvement, for I see improvement all around me, but I would not artificially aid it. The ryots' wants are simple, and he is sufficiently happy, which after all is the great desideratum. Gradually his wants go on increasing, and his efforts in improved agriculture, industry, &c. must go on increasing in the like proportion. This result, though gradual, is general; not so the ephemeral acquisition of wealth, when the son generally ends where the father ended, and it is a question whether the acquired wealth will make the possessor happy or not.

Mr. Krishniengar.

The tenures of land in this district are:—

I. Kandayam, under which fixed assessment is paid in money to the Government, whether the land is cultivated or not, the assessment being subject to revision.

II. Batai, under which the Government gets a share in the produce instead of money assessment, only when the land is cultivated.

III. Kayamgutta, under which whole villages are rented out on a fixed lease, not subject to any revision.

IV. Jodi, or grants of whole villages or lands with partial remission of Government demand, not subject to revision; and,

V. Survamoniyam, or grants of villages or lands entirely free from rent.

Number 1 is the main tenure on which lands are commonly held everywhere in this country.

Number 2 now prevails only in unsurveyed and unsettled taluks, and this too with regard to irrigated lands alone.

Number 3 exists to some extent in a portion of the Province; and

Numbers 4 and 5 are to be found in every part of it to a less or more extent. With the exception of lands held under tenure number 2, and those falling under tenures numbers 4 and 5, for which no special alienation is given in the title deed, all others are transferable.

Up to the year 1863 the occupants of lands held under tenure number 1 were to a great extent hindered from carrying out any material improvement to their lands by digging wells or channels, as they had up to that time to pay enhanced assessment when they raised irrigated crops, though at their own outlay. The rates of assessment levied on lands irrigated by such private wells were so many as 68, the maximum being Rs. 23 per acre. This was found to be so ruinous to the ryots that Mr. Bowring, after making a tour in my district, authorised me to reduce the number of rates to five, and limit the maximum rate of assessment to Rs. 10 per acre. This has relieved the ryots to a great extent, but I would yet make further reductions, as I find that the income does not still bear a fair proportion to the outlay, and consequently the ryots are driven to contract debts for the purchase of bullocks, which they have so often to change when employed in lifting water from deep wells. Since Mr. Bowring's order of 1863, which allowed the ryots to sink wells freely in their holdings and enjoy the full benefit of their labour and outlay without extra impost on that account, 967 wells have been sunk in my district, but considering the large extent of lands where wells could be dug yet remaining without them, I think the number is too small, and this I attribute partly to the revision of assessment to which these Kandayam lands are subject after the expiration of the guaranteed term, and partly to the poverty of the people. It therefore appears to be desirable to give further encouragement to the ryots to sink wells in their holdings, and this can only be done by removing the present popular impression, that after the expiration of the term guaranteed by the Survey Department additional tax would be imposed according to the condition in which the land will be found at the time, without reference to the expense incurred in its improvement, and by providing sufficient money annually for making advances to the poor ryots under the Land Improvement Act. Although this Act has been extended to Mysore only two months ago, and I am therefore unable to say now what have been the effects of it, I have not the least doubt of its proving a great boon to the country. The provisions of the Act are, in my opinion, liberal enough in every respect, and I am sure that the benefit of it will be freely availed of by the poor ryots, as the person seeking the advance can obtain it on the security of his own land, when it is sufficient; the interest charged by the Government is very much lighter than that demanded by the Saucars, and the instalments are easy. The Act may therefore stand as it is. I would, however, adopt every measure to encourage the people of the country to spend their own capital on the improvement of their holdings without looking to Government help, and in view to this great discretion should be exercised in making advances under this Act. Much encouragement might be given to the ryots in this respect by doing away with the distinction of "Baghayat" or garden rate, which is higher than the other two rates, viz., dry and wet. Either the dry or wet land may be converted into garden, but it cannot always continue to be so. It depends more upon outlay and labour than upon soil, and what was once a garden may cease to be so when the holder is unable to bear the extra cost and labour required for the purpose. It is only just that those who spend extra money and labour should be allowed to reap the extra benefit, and I would therefore only have two distinctions, namely, dry and wet, and assess the lands according to the quality of the soil and the quantity of water supplied, without reference to the crops raised, whether paddy, ragi, sugarcane, cocoa, or areca nut, &c.

The improvement of land has been checked to a great extent by the orders issued by the Local Government in 1871, modifying those passed by Mr. Bowring in 1863. Copies of those orders are appended to this report. The extent to which the improvement of land is hindered by the order of 1871 which is now in force, can be observed from the fact that between 1864 and 1871, 562 petty ruined tanks were repaired by ryots and others of the country wholly at their own cost, amounting in round figures to Rs. 2,40,000, adding an annual revenue of 14,200 rupees to rupees 3,000 previously derived from lands below them, and 870 wells were sunk; while since 1871 no more than six ruined tanks were taken up by the ryots, and only 97 wells sunk; and this is, in my opinion, undoubtedly due to the restrictions laid down in the order of 1871. It may also be observed here that out of the 568 tanks thus repaired by private enterprise in my district, 90, which were either breached by accident or only partially repaired, have been resigned, the owners being unwilling to incur any further expenditure in consequence of the Irrigation Department having breached or otherwise rendered useless some of these tanks in carrying out the serial system introduced in this country in the year 1872.

HAP. I. QN.11.

UENTRAL INDIA.

Mr. Wingate.

CENTRAL INDIA.

Bhopal.—Cultivators who break up new land are exempted from rent for three years.

Rutlam.—"Every holder of the above tenure is "at full liberty to make any improvements within his "own holding, such as digging a well, damming a "nullah, or providing any other source of irrigation. "He is entitled to enjoy the full out-turn of his field "beyond the settled jamma. Moreover he has the "assurance of being allowed rent free one-fifth of his "improved land in perpetuity after the expiry of the "existing term and the renewal of the lease. As an "encouragement to increase the means of irrigation, "every 'Asamee' is privileged to borrow from the "State treasury a sum without interest for digging "a well, and to repay the same by easy instalments. "This system has led to many new wells being dug "through the district, and the result is favourable "both to the State and to the cultivator."—*Mir Shahamat Ali, C.S.I.*

Manpur.—"The Land Improvement Act is not in "force in Manpore. On the contrary, the terms of "the settlement in the settled villages debar the "making of any advances to the cultivators. An "annual grant of Rs. 1,700 has been passed in the "Pargannah budget by Government for some years, "to be spent in sinking and improving Government "wells in the pargannah, and additional water rates "are paid by the cultivators of settled villages on "fields irrigated by them from such newly-made "wells."—*Pundit Suroop Narain.*

HYDERABAD.

Ioulvie Mahdi Ali.

HYDERABAD.

1. Are the holders of the above tenures in the habit of carrying out material improvements, such as digging wells, or channels necessary in order to use the water in a canal?

Yes, they are, and specially so during the last four years, because of Government having directed that every encouragement should be afforded to the cultivators to sink wells in their holdings, and that if any cultivator offered to construct a well, the Talukdar should grant him a written *kaul* to the effect that Government would not levy any water rate for irrigating his fields for a period of 30 years. During the years 1285–86 no less than 2,389 wells were constructed, and 570 were under construction.

2. Are their actions in this respect affected most by the security of their tenure, or by their wealth or poverty?

Hitherto it may be said to have been effected mostly by the insecurity of their tenure, as is proved by the fact of their constructing nearly 3,000 new wells during the four years that encouragement has been offered to them to construct them. In times past the cultivators never appear to have constructed as many wells in so short a period.

IAP. I. QN. 12.

CHAPTER I.—QUESTION 12.

How far is the landowner's or the cultivator's readiness to improve the land checked by any operation of the law? Is the digging of wells checked in any such way? How far does the expectation of having to pay increased revenue or rent in consequence of any improvement check the execution of improvements?

PUNJAB.

Mr. Gore Ouseley.

PUNJAB.

I am not aware of anything in the state of the law which unduly checks an owner's or occupancy tenant's readiness to effect material improvements on his land. The digging of wells is certainly not checked by any existing law. As to how far the expectation of having to pay increased revenue or rent in consequence of effecting improvements may check the execution of those improvements, this depends on a variety of circumstances, such as the original cost, the length of time the settlement or lease has to run, the probable annual profit, the disposition of the individual owner or tenant, his age, circumstances, &c., &c.

'ol. Davies.

I am not aware that there is any provision of the law which checks improvements. The Punjab Tenancy Act sufficiently protects the rights respectively of the landlord and of the tenant. But ignorance of the provisions of the law in the case of the latter undoubtedly has the effect of checking improvements, for tenants with rights of occupancy are not as a rule aware that they have any right to make permanent improvements, and the prevailing idea is that a person of this class who sinks a well thereby acquires a proprietary right in the land in his occupancy, or in so much of it as is irrigable by the well, and proprietors therefore will not permit their tenants to make such improvements. The best way to remove this ignorance would be to embody the provision of the law on the subject in the administration paper of villages, but unfortunately we are forbidden to enter in these papers any matter expressly provided for by law.

In the case of proprietors there can be no doubt that the fear of having to pay an enhanced assessment (notwithstanding the promulgation of the rules relating to pattas) operates in checking improvements towards the close of the period for which a settlement has been made. But this cannot be said to have any permanent effect in restraining the investment of capital in improvements. The case of tenants is different; besides ignorance of their rights, there is always before them the knowledge that they may have to pay a higher rent if they sink a well or otherwise increase the productive capacity of their land, and this knowledge must have the effect of permanently checking any disposition on their part to lay out money in improvements.

ORTH-WESTERN PROVINCES AND OUDH.—*See under Question* 11.

BENGAL.

CHAP. I, QN. 1

BENGAL.

Mr. Toynbee

As regards landowners and tenure holders as distinguished from actual cultivators, all their rights are secured to them by law, and the demand of Government revenue is fixed and unalterable. There is nothing, therefore, in the state of the law to prevent their making such improvements on their estates as they consider feasible. But, as a class, they are too many of them merely rent collectors, taking no interest in the material welfare of their lands, or in the prosperity of those who cultivate them. They look no further than to exact the uttermost farthing from those who till the soil. If they dig wells, as they do in Behar, it is that the rent of the lands watered from them may be increased.

The insecurity of the cultivator's tenure, his poverty, and the fear of enhancement together, may prevent him from digging wells and making improvements where they are feasible, but where it has been the custom from time immemorial to resort to artificial irrigation, he will contrive to do so. But of the great body of the ryots of the country, except in Eastern Bengal, it may be said that they have no ambition, no wish to improve their lands, or to do more than to live as their forefathers lived before them. Nothing short of force could stir their apathetic nature to move out of the established groove in which agriculture runs.

CENTRAL PROVINCES.—*See under Question* 11.

BOMBAY.

BOMBAY.

Mr. Peile.

The opinions of the officers consulted on this question are epitomised below :—

Kaira.—There is nothing in the law to check improvements. The conditions of proprietary tenures are all fixed and their liabilities settled by legislation. Those of the survey tenure and the 30 years' settlement do not act as a check. Towards the end of the term of settlement they may temporarily.

Thana.—No provision of the law checks improvements. But a landlord is checked by the rule that if he charge an increased rent as interest on improvements, he cannot get the assistance of the revenue authority* to recover the increment above the survey assessment, and must go to the Court.

Kaladgi.—No such operation of the law is known. Possibly the expectation of a revision at the end of a term of settlement may temporarily deter from improvements.

Dharwar.—The strict provisions regarding loans under the Land Improvement Act check improvements by means of advances. The approach of a revision defers improvements temporarily.

The digging of wells is in no way checked by law. The people are now well aware that they will not be required to pay increased assessment on account of improvements. So far as newly sunk wells were concerned, this point was not definitely settled till some 10 years ago. Notwithstanding, and though before that the people had no reason to expect that they would be exempt from additional assessment on revision, well sinking went on actively. The very low rate of extra assesments on well irrigated land above that on unirrigated land fixed at the first settlement, compared with that commonly before in force, induced the people to have no fear of what might occur on revision at the expiration of the current settlement, up to which time they had an express guarantee of no increase of assessment.

---

* Nairne's Handbook, p. 177.

MADRAS.

MADRAS.

The Board
Revenue.

From the replies to questions 10 and 11 it will have been seen that the uncertainty of the legal position of a Zemindari ryot tends to check the execution of improvements, as does also his liability to have his rent enhanced by his landlord for improvements carried out by means of private outlay.

In the case of a Government ryot there is no insecurity of tenure tending to check the execution of improvements, nor is there any law in force in the Madras Presidency having any such effect. The most distinct assurances have been given to Government ryots that the tax on lands cultivated by means of wells constructed at their own cost will never be enhanced, unless on a general revision of the district rates ; and that in such revision any modification in the assessment of lands so improved will be irrespective of the increased value conferred upon them by their holders.

It has hitherto been considered equitable to charge a water-rate when a well has been sunk on irrigated land or within 10 yards of a tank, river, or channel on unirrigated land; but the Government have lately directed that even these are to be treated like other private wells, and the constructor given the full benefit of his improvement.

MYSORE.

MYSORE.

Mr.
Meiklejoh

Tumkur.—Four of the taluks in this district have been surveyed and settled, and in the others survey operations are being rapidly completed. By the Mysore Government Guarantee, for 30 years after the settlement, dry crop land which may be converted into wet crops solely at the cost of occupiers or cultivators will not be subjected to any extra assessment whatever, nor will any extra tax or cess be imposed on account of fruit or other trees planted hereafter by occupiers or cultivators on account of superior crops being grown. If a well is dug by the cultivator, or a watercourse (*kálvé*) made from a stream, the water of which is not the produce of a work constructed at the expense of Government, no additional assessment will be imposed again.

RAJPUTANA.

RAJPUTAN

Mr. L. S.
Saunders.

Ajmir.—There is a premium on the digging of new wells. A man who digs a new well can get a *pottah* from the district officer, which will protect his land from increase of assessment at *next* settlement, and for the term of that *next* settlement.

HAP. I. QN. 12.

CENTRAL INDIA.

Mr. Wingate.

CENTRAL INDIA.

Bhopal.—The payment of increased revenue prospectively does not discourage wells and tanks, the leases being always for long periods.

Rutlam.—" During the term of the lease every landholder is entitled to enjoy the full income of his improvements. In this case no expectation of having to pay increased rent in consequence of any improvement will check the execution of improvements, because before the expiry of the lease the owner is much more than repaid for any expenses he may have incurred on this account; or if the lease for digging a well is taken from the outset, he will enjoy a reduction of one-third or one-fifth of the revenue, as may be the condition, in perpetuity."—*Mir Shahamat Ali.*

CHAP. I. QN. 13.

CHAPTER I.—QUESTION 13.

What is the general incidence of land revenue on the cultivated area, both for the arable land as a whole and for the different classes of such land (irrigated, dry, &c.)? What proportion does such revenue bear to the value of the gross produce? Is the incidence on the various classes of land fairly distributed, or would you propose any re-adjustment of it? When was the assessment fixed? Has there been any practical difficulty in realizing the land revenue as now assessed? At what dates are the instalments of revenue payable, and what relation do these bear to the ordinary periods of harvest or of realization of rents, as the case may be? Do the several instalments bear a fair proportion to the value of the several harvests from which the revenue or rent has to be made good? What rate of interest, if any, is charged on land revenue in arrear?

Major Wace.

PUNJAB.

What is the general incidence of land revenue on the cultivated area, both for the arable land as a whole and for the different classes of such land (irrigated, dry, &c.)? What proportion does such revenue bear to the value of the gross produce?

In a country such as the Punjab, the major portion of which passed from native to British rule only 30 years ago, the incidence of the land revenue can be stated from three different points of view,—its present incidence as compared with the revenue levied before British rule, the actual cash rates per acre now levied, and the share of the produce which they may be assumed to absorb. Of these three methods of viewing the subject, the first is probably the one entitled to most weight; it is certainly the point of view from which the subject must most commonly be regarded by the agriculturists themselves; and it will readily be admitted that the relation of the State's present demand from the land to the standard sanctioned by the immemorial usage of the country up to British annexation is of at least equal importance to that of its actual present incidence viewed by itself.

On the question of the incidence of the land revenue under the Native Governments, the best testimony is that of those officers who controlled the Sikh Government from 1846 to 1848, during the three last years of its existence. Similarly we can refer to the testimony of those officers, to whose lot it fell in the first years of our administration in the Punjab to reduce the standard of the Sikh Government to such a demand, as they judged necessary for the prosperity of the agricultural classes.

Of such testimony selections are appended to this reply. It is impossible to read these selections and to doubt the substantial accuracy of the following statement, which I quote from the Punjab Administration Report for 1875–76:—

" The Sikh system of assessment was that the State as proprietor-in-chief took all that it could get, and it did take often as much as one-half the gross produce of an estate, besides a multitude of cesses under the names of rasúm, nazráná, &c., and exorbitant fines on succession."

Looking at the evidence before us, it is safe to assert that the Sikh land revenue collections were usually not less than from two-fifths to one-third of the gross produce, independently of the irregular cesses just referred to.

The usual method by which the land revenue was brought into the State's coffers was by lease of large tracts to local governors, or small tracts and villages to local headmen or petty farmers. These men were virtually renters, not collectors. The principle they followed was to collect as much and pay as little as possible. In a bad year they would collect not less than the amount of their lease, and in a good year much more. Thus, though much less than the value of what the agriculturists paid reached the Government's chest, the local managers and farmers took the full value of that share, and a practically unlimited number of additional exactions. I need not here repeat the details contained in the papers appended. But as we read the accounts of such a system written by those who were eye-witnesses of it, we can scarcely understand how the people tolerated it.

The object of our summary settlement was, 1st, to fix the amount of the State's demand; 2ndly, to define the quota thereof payable by each contributor; and 3rdly, to give a small immediate relief in its amount—a relief which was required by the severity of the previous collections and by the depressed state of the country, consequent on misrule.

The object of the first regular settlements was of a similar character. But made as they were some five or six years after the previous ones, our officers possessed a better experience of the amount of revenue that could be demanded consistently with the prospects of each tract. Reductions of 20 and 30 per cent. on the last Sikh collections, and even on our summary settlement, were commonly found to be necessary; a state of affairs which it is now-a-days difficult to conceive. It is true that the instructions under which our revenue officers worked, impressed on them the necessity of moderate assessments, and that the accepted theories required them to make all assessments not exceeding two-thirds of the net assets or rent. But their reports show that there then existed no means of applying such a standard; that, difficult as it now is to ascertain the average produce of land, it was then far more difficult; and that practically their assessments depended on their personal judgment of what it was fair and wise to demand, a judgment mainly based on the collections of the years preceding the settlement. There is seldom any indication in the reports that revenue reductions were lightly given, but complaints that they had been delayed too long were not uncommon.

During the last 20 years other influences have operated to lighten the incidence of the revenue; viz., higher prices and well established increase in cultivation and irrigation. It is believed that on the revised settlements the new assessments usually fairly appreciate increased irrigation; though a serious shortcoming in this respect undoubtedly took place in the re-assessment of the Amritsar and Lahore Divisions between 1862 and 1868. It is more difficult to make the assessments follow increased cultivation. The system of assessment, unlike that of Southern India where each field is separately leased, gives a lease to each village; which lease usually covers all the village land, cultivated and uncultivated. Large increases of cultivation occur during the currency of the lease; and experience shows that at the lease's expiry much caution is required in increasing the State's demand proportionately. Subject to such caution the increase of the land revenue demand proportionately to the increase in cultivation is insisted on at the expiry of each lease; but the value of the increased cultivation, consisting as it not uncommonly does of the poorer soils, is usually less than the ratio it bears to the old; and it would consequently usually be wrong to argue that a revised assessment is lighter than the preceding one, merely because the average rate of its incidence on the whole cultivation is lighter. The influence of prices is in their present unsettled state still more difficult to follow. I have given an account of this subject in my reply to question 16, which it is not necessary here to repeat. But it is pertinent to point out that the position of a revenue officer charged with fixing the revenue lease of a village for a term of years is wholly different from that of his successor, who towards the close of that term will perhaps inquire what proportion of the produce the lease has actually absorbed. It is impossible to make a cash assessment of the revenue, except on the basis of prices which have usually prevailed in past years; but owing to the steady and continued rise in values which has prevailed for 20 years past, the actual value of the produce has nearly always been greater than was assumed as the basis of our assessments.

It is only by bearing in mind these considerations that we can understand the great difference which now exists between the share of the produce which the Punjab agriculturist paid to the State, or rather to the State's farmer up to 1846, and that which he now pays to the British Government. Commencing in 1849 with a standard of one-third of the produce, a period of low prices, combined with other considerations affecting the welfare of a newly-conquered and previously much-oppressed country, compelled us to reduce that standard successively to a fourth and a sixth; and after having done this from the year 1860, a period of high prices has set in under which undoubtedly our assessments absorb very much less than the standard share of the produce on which they were framed.*

The standard share, which was aimed at in the settlement of each district, so far as it can be given, will be found in the appended statements of the average incidence of the revenue in each district. But in estimating its value and its meaning some additional data need to be borne in mind, over and above those already stated.

The preamble to the Punjab Land Revenue Act (33 of 1871) asserts that "the Government is by "law entitled to a proportion of the produce of the "land of the Punjab to be from time to time fixed "by itself." Arbitrary as such an assertion may sound, it is a strictly correct historical statement, as this reply and the papers appended abundantly show. Nor was it inserted in the Act on theoretical grounds; it merely stated the case as we found it at annexation and as the people continue to regard it. But when a revenue officer speaks of the State's demand as being equivalent to a certain share of the produce, the statement is slightly misleading, harmlessly and imperceptibly perhaps to himself, but materially so to economists and to persons unacquainted with the country. In the depressed condition of the country which preceded our rule, little of the produce of land had any marketable value, except grain and butter. This remark does not apply of course to market garden cultivation near towns, nor to such crops as sugarcane, cotton, spices, and the like. But the great mass of the cultivation in a depressed condition of the country is confined to cereals; and nine-tenths (or more) of the marketable produce consists of their grain, wood, grass, straw, milk and other items which add much to the rent of the land in more prosperous conditions of agriculture have no marketable value. It is of the yield of grain that both our former and present officers for the most part speak, when they describe the State's demand as a given share of the produce.

The complete predominance of cereals in the agriculture of the country remains to this day; but the tracts are now few and exceptional in which their grain is the only marketable product; straw, fodder, and butter have now usually a well-established value; and the number of petty items which contribute to an agriculturist's income is increasing. Whatever may be the abstract claim of the State to share in such new sources of profit, and however much our assessing officers may desire to see that a State more moderate than any of its predecessors succeeds in realising the full standard so moderately fixed, in practice it is very difficult to make our assessments keep pace with prosperity of this nature. There are no competitive rents, which might bring to account such accretions to the annual value of land; our assessments are in the form of long leases, and deal directly with petty proprietors cultivating their own lands; and the customary system whereby the State's demand is based on a stated share of the produce does not lend itself easily to the extension of that demand to items of produce not previously reckoned. I do not urge that we are in any way bound to yield the State's claim to share in all marketable produce; I merely assert from personal experience that it is practically difficult to make the assessments follow such new sources of profit; and that, as the agricultural prosperity of the country rises, there is in fact a practical increasing divergence between on the one hand the share of the produce which the State claims and which its officers endeavour to levy by their cash assessments, and on the other hand the proportion which those assessments really bear to the whole value of the produce.

If I have succeeded in describing intelligibly these influences, the reader will not be entirely unprepared for the conclusions arrived at by Mr. T. H. Thornton in an interesting paper appended to this reply (though not prepared in connection with the inquiries of the famine commission), as to the real value of the agricultural produce of the Punjab, the profits of the cultivator and the share absorbed by our land revenue assessments. He finds that the land revenue is one-sixth of the profits, and one-sixteenth of the gross produce of the whole Province.

Such an assertion, when compared with the efforts of our settlement officers to assess a revenue which shall nearly represent one-sixth of the produce in all the more fertile districts of the province, undoubtedly opens a considerable field for discussion. But if all the influences which I have above described be duly weighed, especially the effect of increased cultivation and of rising prices towards lightening the incidence of leases fixed for 20 or 30 years, we shall find reason to admit that the assessment in most years probably now absorbs only one-tenth of the whole produce of the land which pays it (the term produce being understood in its fullest sense).

To proceed to the question of the incidence of the revenue expressed in money, a statement appended shows the average incidence in each district reckoned on the whole cultivated area; and three other statements show the rates paid by irrigated lands in each district, by moist alluvial lands, and by the ordinary dry lands dependent on rain. These rates are so various, that an attempt to summarise them in narrative form would be of questionable utility.

---

* The Financial Commissioner desires to observe that though the Lahore and Amritsur Divisions and one or two other districts were assessed between 1860 and 1872 on a standard of $\frac{1}{6}$ produce, the standard now observed (*e.g.*, in the late assessments of the Mooltan, Derajat and Delhi divisions and Jhelum districts) is $\frac{1}{2}$ assets, *i.e.*, $\frac{1}{2}$ the customary rents, which as a matter of fact are usually produce rents.

'or Wace.

The question how far the incidence of the revenue varies from year to year is one of great difficulty. There are no data from which such a question could be answered. But whenever the annual variation in the area of cultivation, or in the area of irrigation are such as to cause great variations in the incidence of the assessment, it is the accepted policy of Government to modify the ordinary fixed character of its settlements. Thus on the Bári Doáb Canal irrigated revenue is levied not by fixed lump assessments on each village, but by acreage rates on the area actually irrigated each year. The same system is in force on the Upper Sutlej irrigation canals in the Lahore and Montgomery Districts. In the inundation canals of the Mooltan division and Dera Gházi Khan district, though the revenue payable by each village is assessed at a fixed amount, the assessment books show how much of this is charged for canal irrigation; and that share is not leviable in any year in which the irrigation has failed. In the same way in the Mooltan, Muzaffargarh, Dera Ismail Khan, and Bannu districts, where the annual variations of cultivation in the riverain lands situate in and on the banks of the Sutlej, Chenab, and Indus rivers are of a serious character, the assessment payable by each village for such lands is not fixed, but is charged at the settlement acreage rates on the area actually cultivated each year. The same system is also applied to the cultivation of the Dera Ismail Khan district, which depends on the capricious and uncertain torrents that run down from the Sulaiman Range. These fluctuating assessments have been in force about 10 years on the Bári Doáb Canal, and five on the Upper Sutlej Canals. In the other instances they have only lately been introduced.

It only remains to notice one point connected with the incidence of the land revenue, which has often provoked remark. It frequently occurs that heavier rates are paid by the more industrious villages and lighter rates by their less skilful neighbours occupying lands of similar natural advantages. It is practically impossible to adjust inequalities of this nature; and it is politically inexpedient to attempt to do so. The more skilful agriculturists pay the higher rates with more ease than their less able neighbours pay the lower rates; and also after paying the higher rates have a much larger margin of profit left to them. The less skilful agriculturists on the other hand are absolutely unable to pay the higher rates. In dealing with these matters it is impossible to be guided solely by theories of equality of assessment. When differences of this nature are inquired into, they are found to have their origin in the different antecedent circumstances of each class, and not to be merely due to present differences of agricultural skill. So long as the more industrious class is treated with real moderation, they have no just claim to hold their land at rents far lighter than any ever before paid by them. On the other hand, agriculturists, from whom our predecessors have uniformly levied comparatively low rates, have a substantial ground of objection against the enhancement of old established standards of rent merely on theoretical grounds. Every man's right in the soil, and no less that of the State, is to be decided primarily by what he has in fact enjoyed during past years. Any attempt to ignore this principle in our assessments in favour of theoretical equality would not only be financially injurious, but it would be distinctly opposed to the common feeling of the country, which is built up on and permeated by class distinctions to a degree unsurpassed in any other.

AVERAGE INCIDENCE of the LAND REVENUE ASSESSMENT in the PUNJAB per acre cultivated.

[*Note.*—Column 7 of this Statement is copied from Statement No. 8, appended to the Punjab Administration Report for 1876–77.]

Division.	District.	Average rain-fall per annum in inches.		Per cent. of cultivation irrigated.	Land Revenue demand for 1877–78, including fluctuating items.	Average incidence of land revenue per acre cultivated.	Share of the Gross Produce which the Assessment, when made, was intended to cover, so far as can be stated.

---

* It is believed that this is understated. The revised Settlement Report (of 1865–9) says that 43 per cent. is irrigated, viz., by wells 35 and, by canals 8. The latter has increased since settlement. 7 per cent. also is sailab.

Is the incidence on the various classes of land fairly distributed, or would you propose any re-adjustment of it?

The incidence of the revenue on the various classes of land is fairly distributed. The land revenue system of the province provides material securities for this. The settlement of each district being made for 20 or 30 years, as described in reply to the next clause of this question, at the expiration of that term the district comes under re-settlement. The Settlement Officer is required to report in detail the new assessment which he proposes to impose. A separate report is required for each tahsîl. To this end he estimates the value of the gross produce, and the share thereof to which Government is customarily entitled in each tract composing the tahsîl under report; he then explains the proportion of this which each soil ought to contribute, stating the result in the form of average rates on each main class of soils. In doing this he is expected to show that he has observed a just mean between an over minute and arbitrary classification of soil on the one hand, and on the other hand a classification so broad as not to neglect substantial diversities of fertility, natural or artificial, locally recognized by the owners in their dealings with each other, or with their tenants. It is necessary to pay attention to this subject, because the assessment of each tahsîl being first estimated in the lump, the power of distributing it justly over each village depends on a just appraisement of the relative value of the principal soils. The proportion of different soils held by each village is never the same. The Settlement Officer's preliminary report having been approved by the Financial Commissioner, the next step is to divide the gross assessment sanctioned for the tahsîl, or for each principal tract contained therein, over the villages of which it is made up. This is done by applying to the areas of each village the average rates which the Financial Commissioner has sanctioned. The Settlement Officer, however, is not required to apply the rates blindly, but to consider how far the circumstances of each village agree with the average condition of the tract. If the soils or any one soil of a village is better or worse than the average of the tract, or if there are any other circumstances affecting the prosperity or productiveness of the village and its rent-paying power, he is required to adjust the assessment correspondingly thereto. Having thus assessed each village, he again reports the result. This report is in the form of a tabular statement; in this statement each village is entered separately; and in cases in which the assessment proposed for a village differs from that indicated by the general rates before sanctioned, the Settlement Officer is required to record his reasons for the divergence. These proposals being sanctioned, each village is informed of the total sum assessed on it. At this point a new check comes into play for insuring the fair distribution of the revenue. The Settlement Officer cannot dictate to a village the manner in which it should divide the assessment over the holdings of which it is composed, nor impose on the owners his own average rates as their guide in the division of the assessment among themselves; he can, and does, no doubt, influence them materially; but this influence could not be successfully extended to the forcing on them of arbitrary or unfair relative assessment of soils. The form of the assessment will, in some cases, decide the question partially; and this occurs usually in the assessment of canal irrigated villages, where so much of the assessment as is due to irrigation profits is levied by fixed rates on the various descriptions on crops cultivated each year; the amount assessed in each year thus depending partly on the extent of irrigation and the manner in which it is applied. Omitting this and a few other similar instances, the manner in which the gross assessment of a village shall be divided over the holdings is decided by the village owners themselves. In the great majority of cases, especially where the gross assessment has been fairly made, the village owners succeed in doing this amicably. They are practical agriculturists; they have been paying similar assessments for years past; and if in Sikh rule they paid the revenue by a share of the produce, that share usually varied according to the value of the main soils. Moreover, if a Settlement Officer commands the confidence of the people among whom he is employed, the owners of most villages as a matter of fact will not attempt to overreach each other in matters of this sort. Of course in a certain number of cases disputes do arise, though they are rarely very complicated or difficult. When a complaint is filed before the Settlement Officer (the jurisdiction of the civil courts in such matters is barred), it is heard as a revenue case, and there is an appeal from the decision to the controlling revenue authorities. The complaint may be, that the method of distributing the revenue, which the other side desire to enforce, is opposed to the tenure on which the village is held; as where a village is owned on shares, and it is attempted to distribute the revenue on a different principle, or on different shares than the shares of ownership;—or where the village is not owned on shares, the petitioner may complain that the relative value of the soils has been unfairly appraised, or that his own fields have been wrongly classed. The principal basis of decision in these cases is the past practice of the village concerned, and the common practice of adjacent villages similarly situated. No doubt such practice is not an infallible guide; and no doubt also there is a steady action in our settlement whereby inequalities previously existing are corrected under the influence of the views held by the settlement authorities. But we have never attempted to introduce any arbitrary soil classification of our own, and have mainly confined our action to assisting the people to settle such questions voluntarily among themselves; and when they have failed to do so, we have decided such disputes, as far as possible, on the lines already laid down by the agricultural practice of the neighbourhood.

In short, while it is believed on the one hand that the incidence of the revenue on the various classes of soils is fairly distributed, being based on distinctions locally recognized, and on the voluntary action of the land-owners in dividing the gross assessment of each village over their holdings; on the other hand no attempt has been made to make the existing distribution permanent. As the revenue leases of each district expire, and a new settlement is made, the existing system of assessment compels the revenue authorities to reconsider the matter thoroughly; and independently of this action, the landowners have it in their own power on such occasions, either to maintain the former distribution, or to remedy any inequalities which they may consider to exist—a power with which the revenue authorities will not interfere, except upon proof by dissentients that the former system or proposed innovations are inequitable.

When was the assessment fixed?—The whole of the Delhi division, with one exception, has been under re-settlement since 1872, when the assessments (made 30 years before) expired. The exception is a portion of the Karnál district of which the existing leases will expire in 1880, having been made 30 years previously.

In the Hissar division the Rohtak district has been under re-settlement since 1873, its previous 30-year lease having then expired. The Hissar district was settled on a 20-year lease in 1863, and the Sirsa district at various dates about 20 years ago, which expired in 1876. The Sirsa District is about to be placed under re-settlement.

In the Umballa division the existing assessments were nearly all made about 30 years ago. The Ludhiána district has been placed under re-settlement, and the Umballa district will shortly be so treated; the leases in both districts having expired or being on the eve of expiring.

The Jullundur division is in the same position as the Umballa division.

The Amritsar and Lahore divisions, except the Ferozepore district, were settled from 10 to 13 years ago on 20 year leases, which will expire between 1885 and 1888. The greater part of the Ferozepore district was settled on a 30 year lease 24 years ago; the assessment will expire in 1884; and that of the rest of the district, settled later, in 1892.

In the Rawalpindi division, the district of that name and the Shahpur district were settled 20 years ago, and the Gujrat district 10 years ago. The leases of these three districts run for 20 years from completion of the assessment, expiring respectively in 1880, 1881, and 1888. The Jhelum district's leases expired in 1874, and the district has since been under re-assessment.

In the Mooltan division the Montgomery district was settled on a 20 year lease about 1870–73. The rest of the division has been under re-settlement for the last five years.

HAP. I. QN. 13.

PUNJAB.

Major Wace.

In the Derajat division the district of Dera Ghâzi Khan was assessed on a 20 year lease in 1873. The rest of the divisions also has lately been re-assessed, the operations being just completed.

In the Peshâwar division the Kohat district is under settlement; the Peshâwar district has a 20-year lease, and the Hazâra district a 30-year lease, dating from 1874.*

It is necessary to explain the principle on which the dates and duration of each district lease is fixed. It is the fixed policy of Government to give usually leases of 30 years' duration, but for sufficient reason the term is restricted to 20 years or even a shorter period. Such reason may be that the assessment is apparently inadequate, and that important changes, such as the extension of canal irrigation, are impending.

In the next place, it has lately been decided to restrict the number of districts under settlement at one and the same time. It has been found by experience very embarrassing to subject a large number of districts to settlement operations simultaneously; the revenue establishments in all grades become abnormally enlarged; the difficulty of supervising extensive assessment operations is very great; and if important issues are raised, they are presented in a form affecting such large areas that their decision involves great responsibility and very wide-spread results. Moreover, after a few years of these extensive operations no more districts remain to be re-settled; and the Government is consequently compelled to dismiss valuable establishments, and to absorb the covenanted Settlement Officers in the regular line of administration. Subsequently, a few years later, when the leases of other districts have fallen in, these establishments have to be formed anew with great difficulty, and much of the experience before gained has been lost by the hiatus which has occurred in the operations. Under the system lately adopted, by only undertaking the re-settlement of a small number of districts at a time, these evils are avoided. The re-settlement of a district ordinarily takes from four to five years; it follows that six districts can be settled in 30 years; and therefore that with five settlement establishments working in the Punjab,† all the leases would have been revised in the same period; and the leases of those first settled would have by that time expired; so that the five settlement establishments will have continuous employment. The number of settlement establishments is at present in excess of five, but will shortly be reduced to that number. The application of a system of this sort no doubt needs some care, to prevent loss of revenue to Government during its introduction; but it has been ascertained that there are no insuperable, or even very serious, difficulties of this nature; and the system admits of some elasticity of application, as it would be comparatively easy to increase five settlement establishments on occasion to six, or to reduce them temporarily to four. But perhaps the value of the system to the people of the province is even greater than its value to Government, for it ensures that the establishments employed on settlement work shall be carefully trained, and possess steadily accumulating experience; and also that the controlling authorities shall have leisure to consider fully the important issues raised in the course of their operations.

Has there been any practical difficulty in realizing the land revenue as now assessed? At what dates are the instalments of revenue payable, and what relation do these bear to the ordinary periods of harvest or of realization of rents, as the case may be? Do the several instalments bear a fair proportion to the value of the several harvests from which the revenue or rent has to be made good? What rate of interest, if any, is charged on land revenue in arrear?

The land revenue has been realised with ease in the whole province for years past. In the few years immediately following annexation (A. D. 1849), our assessments were necessarily based on the heavier collections of Sikh rule; we had little knowledge of the country at our command; the prices of grain were much depressed, and the peaceful influences of our rule had scarcely begun to tell on the community at large. Under such circumstances it was not to be expected that the land revenue would always be realised with ease. But from the first the use of the severer measures of coercion known to the Land Revenue Law of India was discountenanced. Attempts to sell, transfer, or farm the lands of defaulters were avoided wherever possible; in fact, almost entirely. This action was partly based on a sense of the great difficulties involved in the consolidation of our rule in those earliest days of the Punjab administration; and partly prompted by the personal experience of the principal civil officers first entrusted with its Government, officers who had seen with their own eyes in our older provinces the evil wrought by the use of severe measures to realise a revenue evidently paid with difficulty. We knew that, if we would secure the prosperity and contentment of the country, we could not expect to realise a revenue pitched at the same heavy incidence as that levied by the Sikh rulers. We also knew that the mere striking off a per-centage of what our predecessors had levied was in all cases a very rough measure of relief, and in not a few cases probably an insufficient one. Any attempt to realise balances with severity was consequently avoided from the first. New settlements of a complete or summary character were rapidly pushed on, and the growth of the cultivated area gave whatever additional relief was required. It followed that ten years after the Punjab was annexed the difficulties of over-assessment which the Sikh Government had bequeathed to us had disappeared; higher prices set in; and from that time to the present the cases of difficulty in realising the assessment have been few and exceptional.* Further information on the subject is given in the reply to question 14.

As regards the instalments in which the land revenue demand is paid, over the greater part of the province, they are four in number, payable at the following dates:—

RABI	1st Instalment	15th June.
	2nd. Instalment	15th July.
KHARIF	1st Instalment	1st December.
	2nd Instalment	1st February.

There are local differences of practice, which have been allowed to suit specialities of season and crop; but no object would be served by detailing minor differences of this nature. The principle on which the above instalments were fixed, and variations from them are allowed, is that the agriculturists should be allowed full time for harvesting their crops, and landowners for collecting their rents, before they are required to pay the revenue demand. If the reply to question 5 be referred to, it will be seen that the harvesting of the Rabi crop is completed by May, and that of the Kharif by November (except sugar-cane, which is later); so that the above dates for paying the revenue amply meet the principle on which they were fixed. There is indeed in the Financial Commissioner's opinion reason to fear that the liberality of Government in thus delaying its demand has in some cases been carried too far. The Patwârí (revenue accountant) of each village is bound to have ready a month

---

* In the foregoing remarks I have abbreviated details as much as possible, the object, I presume, being rather to give a summary of the subject than unimportant details concerning each district. The dates are taken from statement 23 appended to the Annual Revenue Report for 1876–77, the last issued.

† The number of districts is 32; of which one, Simla, is very small.

* The total number of warrants issued for revenue over-due in the year 1876–77 was 47,850; and only in 142 cases was it necessary to enforce them by personal imprisonment, and in 217 cases by distraint of chattels.

CHAP. I. QN. 13.

PUNJAB.

Major Wace.

before the revenue of each harvest falls due a statement showing the demand payable by each owner.

As regards the proportion that each instalment bears to the value of the harvest for which it is paid, there is no reason to suppose that it is otherwise than fair. These proportions were originally established at a time when much of the revenue was levied in kind, or if levied in cash was assessed at each harvest by appraisement of the standing crop; and they were presumably based on the accounts of what was actually levied under such systems. The agriculturists, moreover, do not view with favour innovations in matters of this kind until a substantial necessity arises for them, or unless the changes to be introduced carry with them some obvious advantage.

Both this subject and also that of the dates and number of instalments are open to re-adjustment at each settlement of a district; and any changes which are desired, or for which a substantial reason can be shown, are then sanctioned by the Local Government. Several proposals of this nature have been sanctioned in the late settlement of the Mooltan, Derajat, and Peshâwar divisions.

The following table shows the proportion of the land revenue of each division paid at each harvest, and roughly the manner in which that compares with the produce of each harvest;—

Division.	Per-centage of the annual demand paid.		Of the average annual area cultivated with crops, what per-centage is cultivated with		REMARKS.
	At the Rabi harvest.	At the Khárif harvest.	Rabbi crops.	Khárif crops.	
Delhi - - -	51	49	40	60	The last two columns only show the area of the crops of each harvest. It would not be possible to show the value without entering into a complicated calculation.
Hissar - -	35	65	21	79	
Umballa - -	47	53	55	45	
Jullundur - -	43	57	55	45	
Amritsar - -	50	50	61	39	
Lahore - -	55	45	58	42	
Rawalpindi -	54½	45½	59	41	
Mooltan - -	57	43	69	31	
Dereját - -	58	42	59	41	
Peshâwar - -	41	49	63	37	
Total -	49	51	51	49	

It should be added that so much of the land revenue as may be assumed to be contributed by grazing and milch produce is by the old customs of the country a kharíf demand. It is only in autumn that the grasses of the hills and waste plains attain any nutritious growth, and the dues levied by owners on cattle grazing are very generally known by the name of *sawani*, or the dues of sáwani (15th July to 15th August), the month when the grass grows. The richer crops, sugar-cane, rice, cotton, indigo, &c., also belong to the kharíf season.

No interest is charged on land revenue in arrears.

Mr. Thornton.

NOTE by MR. T. H. THORNTON on an Article by MR. HYNDMAN in the "Nineteenth Century," entitled the "*Bankruptcy of India,*" considered with reference to the Province of the Punjab.

I.

A full and complete criticism of Mr. Hyndman's paper must necessarily be a work of time and of more minds than one, for it involves acquaintance — and more than superficial acquaintance—with the state and circumstances of a population of 200,000,000, a population divided into races widely differing from each other in habits and in language, spread over an area 12 times the size of the United Kingdom, and living under distinct physical and administrative conditions. But, meanwhile, an examination of his statements, as applied to one out of the nine provinces of British India, will not, perhaps, be valueless.

If his conclusions are shown, so far as that province is concerned, to be erroneous, this, of itself, will be a point gained; the area of alleged insolvency will be sensibly contracted and an instalment of relief afforded to the public creditor, while, should the process of investigation reveal, as I believe it will reveal, errors or misconceptions affecting the principles of Mr. Hyndman's calculation, fair ground will be given for questioning the correctness of his conclusions generally. I propose then to examine Mr. Hyndman's statements with special reference to the province of the Punjab, a province with an area larger than Great Britain, and a population—allowing for increase since the census of 1868—of 20,000,000 souls. I select this province simply because it is the part of India in which I have been employed for many years, and I propose on this occasion to restrict my inquiry to its agricultural population of 11,000,000, leaving the non-agricultural population to be dealt with, if necessary, in a future paper.

Before proceeding further, let me briefly recapitulate the main points of Mr. Hyndman's arguments. The annual value of the agricultural produce of British India, Mr. Hyndman says, is 300,000,000*l.* This sum divided amongst a population of 190,000,000, gives an average yearly income per head of 31*s.* 6*d.*, But, judging from the cost of dieting a prisoner in the Bengal gaols, viz., Rs. 28 or 2*l.* 16*s.* per annum, the cost of food alone (irrespective of clothing, repairs, feed of bullocks and other contingencies) must amount, all round, to Rs. 23, or 46*s.* per head of population. *Ergo*, the people have not the means sufficient to procure even the necessaries of life. Furthermore, supposing the produce to be divided, not amongst the entire population, but amongst the agricultural population only, still, as this population comprises 150,000,000 out of the 190,000,000, the same result will be obtained, namely, that the mass of the people have not the wherewithal to support a healthy existence. In these circumstances, the taxation (Imperial and local), though falling at the low rate of 5*s.* per head, is crushing; India is becoming more and more impoverished, whilst the soil, ill-farmed and over-cropped to meet immediate necessities, is year by year deteriorating.

The first criticism suggested by these statements is one of a somewhat fundamental character, but it will be endorsed, if I mistake not, by all who are familiar with the circumstances of peasant life in India; it is that Mr. Hyndman's method of gauging the financial condition of the agriculturist is an exceedingly fallacious one. It proceeds upon the supposition—a very natural one for Englishmen, but not the less erroneous—that the Indian peasant, like the English farmer, sells all his produce and buys all his supplies. Fortunately or otherwise for himself, but unfortunately for statists, the Indian peasant, as a rule, pursues a different course. He retains so much of his produce as he requires for seed and home consumption and disposes of the surplus only; and this surplus he does not ordinarily sell in open market, but makes over to the village *banyan* with whom he has an account current for cash advanced and goods supplied. To attempt to give a money value to these primitive transactions and formulate the financial condition of the peasantry in terms of cash receipts and payments must be, under such circumstances, a very hazardous undertaking. To do so, without local knowledge, is certain to result in error.

But the method, bad or good, has been used by Mr. Hyndman, and used, indeed, with startling effect. It will be well, therefore,—in the first instance, at all events—to follow the method he has employed, but test, with the aid of local knowledge, the correctness of his calculations.

Let us therefore examine Mr. Hyndman's statements with special reference to the agricultural population of the land of the Five Rivers.

In other words, let us estimate, so far as circumstances permit, the receipts and expenditure of the Punjab peasantry, inquire into the distribution of their profits and the pressure of their taxation, and see how far the situation corresponds with the gloomy picture given in the preceding paragraph.

II.

What then, are the annual receipts of the Punjab agriculturists?

They are estimated by Mr. Hyndman at 33,800,000*l*. sterling, a result arrived at by taking the area under cultivation at 20,957,735 acres, or, in round numbers, 21,000,000 acres, the yearly value of the produce at 36,000,000*l*., and deducting from the latter the sum of 2,200,000*l*., as representing the value of seed grain.

In the above calculation the statement of area cultivated and the value of its produce may be accepted as approximately correct. It is taken, in fact, directly or indirectly, from the report of the Punjab census of 1868 and the statistical returns published annually by the Punjab Government; some further details, derived from the same source, are given in the subjoined table :—

Crop.	Average Area under Crop in Acres.	Average Produce in Lbs.	Value, at average Market Rates, in £.	Remarks.
Wheat - - - - -	6,000,000	5,280,000,000	13,200,000	I have taken the average produce per acre of wheat at 880 lbs.; barley at 1,040 lbs.; maize and millets from 425 to 610 lbs.; pulses at 400 lbs. all round; rice at 850 lbs.; oil-seeds at 420 lbs.; cotton (cleaned) at 100 lbs.; in accordance with the opinion of the Financial Commissioner based upon a series of experiments and returns of average yield obtained from all classes of soil in all parts of the province. Where the returns of average yield are less reliable, I have based the estimate of value chiefly on the selling price of the standing crop. Thus sugar-cane and poppy have been valued at 5*l*. an acre, condiments and vegetables at 4*l*., tobacco and indigo at 3*l*. The market values have been calculated on the average of seven years ending in 1877–78.
Barley, Maize, and Millets	7,500,000	4,900,000,000	8,900,000	
Pulses - - - -	3,300,000	1,320,000,000	3,000,000	
Condiments, Pepper, Turmeric, Coriander, &c. - - -	200,000	100,000,000	800,000	
Rice - - - -	735,000	624,000,000	3,400,000	
Vegetables - - -	200,000	1,200,000,000	800,000	
Oil-seeds - - -	720,000	300,000,000	1,000,000	
Cotton - - - - -	630,000	63,000,000	1,000,000	
Sugar-cane - - -	374,000	600,000,000	1,800,000	
Tobacco - - - -	74,000	74,000,000	200,000	
Indigo - - - -	100,000	4,000,000	300,000	
Poppy (heads, opium, and seed)	12,500	8,400,000	60,000	
Miscellaneous crops of food grains, fibres, dyes, fruits, &c., &c. - - -	804,500	- - -	1,540,000	
Total -	21,000,000	- - -	£36,000,000	
	The area given above does not include fallows amounting to 4,000,000 acres, more or less.	Deduct for seed	2,200,000	
		Balance - -	£33,800,000	

But here we encounter the first of Mr. Hyndman's "misconceptions." A statement of the annual value of the harvests, however accurately estimated, is not an exhaustive account, or anything like an exhaustive account, of the receipts of agriculturists. Such statement, besides leaving out of view a multitude of minor sources of profit, such as receipts from sale of straw and other fodder, the produce, other than fruit, of cultivated trees and shrubs,[*] and the gain, sometimes considerable, from the sale of fish, eggs, and poultry, takes no cognizance of three important items of a peasant's income, viz., the proceeds of *dairy*, *stock*, and *forest* produce.[†]

In the case of the province with which we are at present concerned, two out of the above three items, viz., *dairy* and *stock* produce, are specially remunerative; for, while the local demand for them is more than ordinarily great, the opportunities for production are exceptionally favourable. The local demand is more than ordinarily great, because the bulk of the population are (for India) large consumers of flesh, milk, and ghee, and require, for at least six months in the year, protection against the cold in the shape of blanketing and woollen wrappers. The opportunities for production are exceptionally favourable by reason of the large extent of land available for pasture. Many of the Punjab villages, especially in districts west of the river Satlaj, and south of the Salt Range, possess, in addition to the ordinary fallows, large areas of waste; while in the *Doabs* or stretches of low jungle between the beds of the large rivers, there are millions of acres of grazing land, the property of the State, where large numbers of buffalo, cattle, sheep, and goats are pastured on payment of a small fee.

With regard to *forest* or *jungle* produce, leaving out of view income derived from such items as barilla,[*] saltpetre, gum, lac, bamboos, catechu,[†] tamarisk galls,[‡] dhak leaves,[§] manna, wild honey, fruits[‖] and fibres;[¶] no small returns are derived from the sale of two of the prime necessaries of life—timber and firewood. The former source of profit is confined chiefly to villages of sub-montane, or hill districts, where the country is well wooded, but many village communities in the plains have, in their waste or jungle lands, large supplies of fuel, which they dispose of to the non-agricultural population at an average rate of 1*s*. per cwt.

---

[*] The following are a few specimens :—

Kikar (*Acacia arabica*).—The commonest tree in the Punjab. Bark largely used in tanning and spirit distillation; seeds in dyeing.

Tún tree (*Cedrela toona*).—Flowers yield a yellow dye.

Plantain.—Leaf used for fibre.

Mauwa (*Bassia latifolia*).—Spirit distilled from the flower, and a valuable oil expressed from the seed.

Amaltas (*Cassia fistula*).—Seeds and flower used largely as medicine; bark in tanning.

Fálsa (*Grewia asiatica*).—Bark used for fibre.

Harítha (*Sapindus acuminatus*).—Seeds largely used as a substitute for soap.

Bahera (*Terminalia, belerica,* and *chebula*).—Common in the hills. Bark used in tanning; fruit valuable as a medicine; the produce of one tree sometimes selling for Rs. 2,000.

Add to which the flowers of the jessamine and willow, &c., common in many villages, are largely employed in the manufacture of perfumes.

[†] Under *dairy* produce I include milk and its products, viz., *ghee* or clarified butter, *dahi* or curds, butter-milk, and cheese; under produce of *stock* I include wool, hair, hides, and skins, meat and animals sold for draught or dairy purposes; under *forest* produce I include receipts from sale of timber and fuel, and the spontaneous produce of uncultivated lands.

[*] Made from the ashes of wild-growing *salsolas*, known locally as *lahna*.

[†] The coagulated extract from the *Acacia catechu*—the *Terra japonica* of commerce.

[‡] Used in tanning and dyeing.

[§] The leaves of the dhak (*Butea frondosa*) yield a yellow dye, and its bark is used for ropes.

[‖] *e.g.* the fruit of the pilu (*Salvadora oleoides*), the wild caper, the jhand (*Prosopis spicigera*), and the wild plum largely consumed as food by the poor.

[¶] Especially the grass known as munj (*Saccharun munja*) much used for well ropes, thatching, and furniture.

No complete returns of either dairy, stock, or forest produce are available, and I cannot myself pretend to any practical acquaintance with farming or with forestry, but, with the help of official statistics and the information afforded by English and native experts, I venture, at the risk of being extremely tedious, to give the following rough estimates of the amount and value of these sources of income :—

(1). *Milk and its products.*—Of the milk of cows and buffaloes produced in the Punjab, the greater portion, say three-fourths, is converted into ghee, the butter-milk resulting from the process being retained, for the most part, by the peasantry for home consumption; of the remainder, some is consumed *au naturel*, and the rest in the form of curds, and occasionally cheese.* For estimating the value of this produce the following data are available :—

(*a.*) From the Punjab stock returns (which are believed, if anything, to understate the truth) it would appear that the number of milch cows and buffaloes in the Punjab cannot be less than 1,500,000, capable of yielding milk, ghee, and curds to the value of at least 4,000,000*l.* annually ;

(*b.*) The amount of ghee allowed to adult prisoners in gaol, *i.e.*, the minimum considered sufficient for the maintenance of health, is 5 lbs. per head per annum ;

(*c.*) The amount imported into towns (as shown in the octroi returns) gives an average annual consumption of 8 lbs. a head ; but this does not include the ghee produced within octroi limits, the amount of which must be considerable ;

(*d.*) The estimate of consumption of ghee in towns, made for the purpose of regulating octroi taxation, gives an average of 9 lbs. per head per annum.

Upon the whole we shall probably be not far wrong if we take 8 lbs. a head as the average yearly consumption of this item of dairy produce. On this assumption the value of ghee annually consumed by the Punjab population of 20,000,000 will amount (at 4 lbs. of ghee per rupee) to 4,000,000*l.*; but in calculating the value of the Punjab produce, the net value of imported ghee, viz., 800,000*l.*, must be deducted, leaving 3,200,000*l.* as the value of the local produce. Taking one-fourth of this amount, or 800,000*l.*, to represent the value of unconverted milk, curds, and cheese, the total value of the dairy produce consumed or sold in the Punjab may be estimated at 4,000,000*l.* yearly.

(2). *Wool and Hair.*—Wool, the produce of the plains, is used in the manufacture of coarse blankets, rugs, and felt; the superior wool of the hill tracts of Kangra, Hazara, and the Salt Range, is woven into a broadcloth known locally as *pattu*, and into *lois*, or woollen wrappers. The soft hair of the camel furnishes material for *chogas* or outer vests, and that of goats is used locally for ropes, matting, and grain bags. Assuming each family of five to purchase but one new blanket annually, the yearly supply of coarse wool required for the mass of the population will amount, at 6 lbs. of wool per blanket, to 24,000,000 lbs. representing, at 3*d.* a lb., a money value of 300,000*l.* Adding to this amount 300,000*l.* as the value of the superior wool of the hill tracts, and of goats and camels' hair, and the sum of 200,000*l.* as the average value of our exports, we may estimate the total annual value of the wool produce of the Punjab at not less than 800,000*l.*

(3). *Hides and Skins.*—The hide of cows and bullocks is used for the upper leather of common shoes, for saddlery, harness, and accoutrements, for flour bags (*khallar*), and in some districts is made into flasks, hookah bowls, and other household utensils. That of the buffalo is used chiefly for shoe soles and for the leather thong connecting the yoke with the plough ; that of the camel for large scale dishes and *kuppas*, or receptacles for oil. Sheep and goat skins are used for the upper leathers of superior kinds of shoes, shoe linings, bookbinding, and water bags, and, in hill districts, are made into a kind of wash-leather used as an article of clothing, and into soft red leather known locally as *lakhi*. *Posteens*, or outer coats of sheepskin, are much used for winter wear on the north-western frontier. The leather manufactures of the province are inferior, but the local consumption is large, and the export not inconsiderable ; shoes go in large numbers eastward, and the soft red leather of Nurpur and otter skins find a market in the north. The export of the raw material has been increasing greatly of late years and is now equal to nearly a third of the hide exports of Calcutta. The market value of the raw hides annually required for the manufacture of common shoes is estimated by experts at 400,000*l.* and of that used for the other purposes above enumerated may be taken roughly at 200,000*l.* The value of hides exported (as shown in the Punjab trade returns) averages 150,000*l.*,* and that of the raw material of leather exports may be taken at 50,000*l.* Altogether 800,000*l.* will not be an excessive estimate of this item of produce.

(4). *Meat.*—(*a*). Assuming the adult population of the Punjab to consume meat to the extent it is allowed to prisoners in gaol, the value of the meat required for the province will amount, at 2*d.* a lb., to 3,300,000*l.* annually.

(*b.*) Assuming the population generally to consume meat to the extent to which the octroi returns and estimates show it to be consumed in towns, the annual value of the meat consumed in the Punjab will be 2,500,000*l.*, without taking into account the value of the better class of meat largely consumed by the troops† and English residents of the province. To be on the safe side we will take the smaller sum, 2,500,000*l.* per annum., as the value of the Punjab meat supply.‡

(5.) *Animals sold for Draught or Dairy purposes.*—Of the value of animals thus disposed of annually it is impossible to form an estimate approaching accuracy ; but the receipts under this head must be considerable. The number of cattle required yearly to replenish the stock employed in cultivation cannot be less than 500,000, and their value, at the lowest market rates, will amount to 1,000,000*l.* sterling ;§ the number of milch cows and buffaloes being, as we have seen, about 1,500,000, the number required annually to keep up the stock cannot be less than 150,000, representing a money value of at least 300,000*l.* Then large numbers of buffaloes and bullocks are purchased from agriculturists for transport of grain and other merchandise, for turning mills and other purposes of draught not connected with agricultural operations. Altogether the value of cows, bullocks, and buffaloes annually sold by agriculturists may be safely estimated at not less than 1,500,000*l.*

Of receipts from the sale of sheep and goats (otherwise than for slaughter), poultry and game, I will not hazard a conjecture.

(6.) *Timber and Fuel.*—Of the value of timber sold by villagers, it is impossible to make more than a very rough calculation.

The last octroi returns show an importation into towns of 220,000*l.* worth of building materials for the use of 2,200,000 of the population, and these must have consisted almost entirely of timber, for bricks are ordinarily untaxed. Assuming then the agricultural population of the province to obtain their timber gratis, the value of the timber used annually by the non-agricultural population for buildings alone will amount to about 900,000*l.*, to which must be added the value of Punjab timber supplied by villagers for the construction and maintenance of railways and other public works, for boat-building, carts, furniture, and other purposes. Altogether 1,000,000*l.* will not, I think, be an excessive estimate for this item of receipt, after making due allowance for the value of timber supplied from Government lands and from the territories of Native States.

---

* Cheese is also made from the milk of ewes and goats, but is not an article of general consumption, except, perhaps, among the Patan races of the north-west frontier.

* According to the returns for 1877–78 just received, the value of hides exported in that year was 440,000*l.*

† The meat rations of the British troops in the Punjab, procured on very favourable terms, cost the Government upwards of 40,000*l.* per annum, or about 2*l.* 10*s.* per soldier.

‡ An amount sufficient to furnish the adult population with a little more than 1 lb. of meat a fortnight per head.

§ According to the latest return of cultivation, the area prepared for the spring crop exceeded 12,000,000 acres, requiring, for ploughing and irrigation, at 5 acres per yoke in well lands and 7 acres per yoke in the remainder, upwards of 4,000,000 cattle. Taking 4,000,000 as the number of cattle employed, and assuming each animal to last on an average 8 years, the yearly supply required will be 500,000. As to value, according to the latest yearly returns, the price of plough bullocks in the Punjab ranged from 2*l.* to 5*l.* 10*s.* each, the average being 3*l.* 12*s.* I have assumed the average price to be the lowest of these quotations,—viz., 2*l.*

In regard to fuel it may be observed that the fuel consumed in cooking prisoners' food amounts to 266 lbs. per head per annum, costing at market rates 2*s.* 4½*d.* per prisoner. At this rate the value of the fuel used for cooking purposes by the non-agricultural population (I assume the agricultural population to obtain their fuel *gratis*) would exceed one million sterling annually; but the cooking of prisoners' food being done on a large scale requires a minimum of fuel; the amount allowed a sepoy for the same purpose is exactly four times as large; taking a mean between these two extremes, and reckoning the amount of fuel required per head of non-agricultural population for cooking and other domestic purposes at half the amount supplied to sepoys for cooking only, we shall probably be well within the mark. On this assumption the value of fuel supplied annually to the non-agricultural population for household purposes will amount, at market rates, to 2,000,000*l.*; but this amount does not include the value of fuel supplied for locomotives, steamers, manufactures, and other non-domestic purposes, which must amount to, at least, 300,000*l.* more.

According to the above estimates, the aggregate value of the dairy, stock, and forest produce of the province must amount on the average to at least 13,000,000*l.* This raises the value of the annual produce of the Punjab from 33,800,000*l.*, the amount estimated by Mr. Hyndman, to 46,800,000*l.*

But in estimating the value of this produce to the agriculturist some deduction must be made from its market value on account of cost of carriage, and the profits of the grain dealer or salesman. Allowing a deduction on these accounts of 10 per cent., the average money value of the Punjab produce to its producers, in other words, the receipts of the agricultural population, will amount to 42,120,000*l.*, or in round numbers, 42,000,000*l.* annually, giving an average income per head of about 76*s.* instead of 40*s.* as estimated by Mr. Hyndman.

III.

Having dealt with the receipts, let us proceed to the second stage of our inquiry, and endeavour to estimate the *expenditure* of the Punjab peasantry.

The subject may be conveniently considered under the following heads :—Cost of *food, clothing, repairs and miscellaneous household expenses*; cost of *seed grain, labour, feed of cattle, replenishment of stock, repair and renewal of agricultural implements, keeping well gear in order, manure and other farming contingencies.*

Of the above-enumerated items, Mr. Hyndman has furnished an estimate of one only,—the cost of *food.* His estimate in this case is based on the annual charge per head for feeding prisoners. Finding this charge to amount in Bengal gaols to Rs. 28, or 56*s.* per head, he has taken it to represent the yearly cost of the food of an adult, and, allowing a small reduction for children, assumes an average rate of Rs. 23, or 46*s.* per head per annum, as a fair estimate of the cost of living by the population generally on the Government standard.

Here we are introduced to more of Mr. Hyndman's "misconceptions." Objection might indeed be fairly taken to the adoption, under any circumstances, of Indian gaol dietary as the standard of healthy and sufficient food; for, applying, as it does, to persons subjected to labour, frequently harder and certainly more continuous than in ordinary life, and suffering from the depression resulting from confinement, it is notoriously in excess of the requirements of peasants living at their homes; but, waiving this objection, it is impossible to accept the cost of such dieting, reduced by less than one-fifth, as representing, even approximately, the cost of living by persons of both sexes and of all ages in all parts of India.

In the first place, the Bengal rate of charge for feeding prisoners (Rs. 28 per annum) is by no means universally applicable; it is certainly not applicable in the Punjab, where food is cheap, and prisoners are liberally dieted* at an average cost, in ordinary years, of less than Rs. 20 or 2*l.* per head. To be on the safe side, let us assume the average cost to be 2*l.*

In the second place, the cost of such diet to the population, and especially the agricultural population, is far less than it is in the case of prisoners, and for obvious reasons, for the price of all the constituents of gaol diet, except vegetables, which are grown in the gaol garden, is enhanced by cost of carriage, dealers' profits, agency charges, &c., until it exceeds the price of the same articles at the place of their production by as much, in some cases, as 15 or 20 per cent. To be on the safe side, let us assume the difference of cost to be 12½ per cent. only; this will reduce the cost of diet on the gaol standard in the case of the adult male agricultural population of the Punjab from 40*s.* to 35*s.* per head.

In the third place, in the calculation of his average rate, Mr. Hyndman has made a very inadequate reduction on account of the smaller consumption of food by women, youths, and children. In the Punjab gaols the diet allowed to women and youths between the ages of 12 and 16 is about one-fifth less in amount than that of male adults, that required for children between 12 years and infancy may be safely set down as not more, on the average, than half the amount necessary for working men.

Assuming then the entire agricultural population of the Punjab to live as well as the inmates of our gaols, the cost of their food will be as follows:—

	£
3,500,000 adult males at 35*s.* per annum -	6,125,000
3,000,000 adult females at 28*s.* per annum	4,200,000
1,300,000 youths and girls between 16 and 12 years at 28*s.* per annum - -	1,820,000
3,200,000 children at 17½*s.* per annum -	2,800,000
Total - -	14,945,000

Falling at the rate of less than 28*s.* per head of population, instead of 46*s.* per head as estimated by Mr. Hyndman.

As to *clothing*, the "full dress" of a Sikh cultivator consists of a small turban of coarse cotton cloth, a *khes* or wrapper, short drawers or a waist cloth of the same material, and a pair of stout shoes; in the cold season a cotton quilt or a coarse woollen blanket serves in the double capacity of greatcoat and coverlet. When at work, whether in summer or in winter, he usually dispenses with all save the turban and the waist cloth. Women wear a *lenga* or skirt, a *chádar* or wrapper, generally red and embroidered with rudely executed flowers, and trowsers reaching to the ankle, all of Indian cotton, some wearing in addition a *choli* or small tight-fitting stomacher. The Mahomedan cultivators are, as a rule, more amply clothed, for, in deference to the injunctions of the Prophet, their drawers descend considerably below the knee, and the waist cloth assumes the dimensions of a skirt, reaching from the middle almost to the ankle.*

---

* The diet of an adult male prisoner sentenced to labour consists in the Punjab of nearly one pound and a half of flour per diem, pulses four times a week, meat or curds and butter-milk with vegetables and ghee three times a week, condiments daily, and salt at the rate of 11½ lbs. per annum. This scale of diet was adopted by the Punjab Government, on medical advice, after years of practical experience of the food requirements of prisoners; it has proved sufficient to maintain even the hardest labouring prisoners in excellent health, so much so that in nine gaols out of ten the mortality is less than that of London, and far less than that of the town population of India.

The cost of such costume, even in the case of Mahomedans, is not large; judging, indeed, from the clothing charge in gaols, and inquiries made from agriculturists, it must be easy for the Punjab peasant, with the help of homespun cotton, to provide himself and family with raiment and blanketing for 1*l.* a year while his shoemaker's bill for the whole household need not exceed 6*s.* These may appear small sums, but it is to be remembered that, in the Punjab, cotton cloth, well suited for the ordinary wear of the agriculturists, can be procured for 1½*d.* a yard, and coarse woollen cloth or blanketing for 4½*d.* a yard; that a change of raiment can be bought for 3*s.* 3*d.*, and a pair of full-sized shoes for 9*d.* At this rate the cost of clothing the agriculturists of the Punjab may be estimated, on a liberal basis, at 3,000,000*l.* per annum.

The next item is that of *repairs and miscellaneous household expenses.*—The following account of the dwellings and household furniture of the peasantry, taken from Colonel Davies' Report of the settlement of the Shahpore district, may be accepted as applicable to all plain districts in the province:—

"The dwellings," he says, "consist of one or more rooms called *kothas*, with a courtyard in front, often common to several houses. The rooms are built ordinarily of clay, gradually piled up in successive layers and then plastered. The roofs are invariably flat, and are used as sleeping places in the hot weather. In the courtyard is usually seen a manger and a house in which the cattle are sheltered from the cold in the winter months, which structures consist generally of four walls covered with a thatch. As a rule, the houses of the peasantry are built for them by the village carpenter or potter, who receive their food while the work is going on, and presents of clothes or money when the work is finished. The timber used for roofing is usually kikar (*Acacia arabica*) or ber (*zizyphus jujuba*) in the plains, and wild olive in the hills; the first two being usually the produce of the peasant's own fields."

Of furniture, he says:—

"First there are the receptacles for storing grain of various sizes. These are made by the woman of the house of fine clay mixed with chopped straw. Next are to be seen some spinning wheels, an apparatus for churning milk, an instrument for cleaning cotton, a number of circular baskets, with or without lids, made of reeds, in which are kept articles of clothing and odds and ends; trays of reeds used in cleaning grain; a goatskin water bag; a set of wooden measures for grain; a leather bag for carrying flour when away from home; a variety of cooking vessels, some of iron and others of a composition resembling bell-metal; a number of earthern pots and pans, in which are stored grain, condiments, and other articles of food; a coarse iron sieve; a pestle and mortar. These with a few stools and cots complete the list of fittings up to an interior."†

With wood procurable *gratis* on the farm, or from the common, clay in abundance, and straw on the premises, repairs, whether of house or furniture, must, in households such as those described above, cost almost *nil.* The miscellaneous expenses consist chiefly of cost of oil, tobacco,* and occasional sweet meats, so that if we allow an aggregate sum of 2,000,000*l.* per annum on account of repairs and miscellaneous expenses combined, we shall have provided the Punjab agriculturists with all that is necessary for a very comfortable existence.

We have now to consider the several items making up the cost of *cultivation.*

Seed-grain has already been provided for, and so has the *cost of labour*; and the *replenishment of stock* has been already estimated to cost 1,000,000*l.* yearly. As for *feed of cattle*, plough bullocks are, for the most part, fed *gratis* with chopped straw and husks, stubble, crushed surgar-cane, cotton seeds, and other refuse produce of the farm, with the leaves of certain trees, such as the ber (*zizyphus jujuba*), the mulberry, and, in hill districts, the bahera (*terminalia belerica*), and from the grazing on the common on the fallows; but their ordinary food has, at certain seasons of the year, to be supplemented by grown fodder, such as clover, trefoil, turnips, moth (*phaseolus aconitifolius*) and young green crops. The amount of grown fodder given varies in different districts according to the amount of rain-fall and the extent of pasture land available. In the case of the district of Syalkot, a district with a good rain-fall and a fair amount of grazing land, it is estimated by Mr. Prinsep, late Commissioner of Settlements, to amount for well cattle to 200 lbs. weight per annum, costing, at present rates, about 5*s.* Assuming plough cattle, not required for irrigation, to receive half the above amount, and all districts to be similarly situated to Syalkot, the cost of supplementary fodder for cattle used in husbandry would, for the province, be 700,000*l.* But in the drier parts of the Punjab the amount of grown fodder required for the cattle is naturally greater. As an extreme case we may take the district of Dera Ghazi Khan with a rain-fall of about six inches. Here, according to Mr. Fryer,† upwards of one acre in every ten cultivated has to be set apart for growing fodder. At this rate the value of the extra fodder required for the plough and well cattle of the Punjab would amount to 2,200,000*l.* per annum. The real cost for the province must lie somewhere between these two amounts. Bearing in mind the fact that (1) fodder crops are often omitted from the crop returns, and that (2) they are not unfrequently grown intermingled with, or in addition to other crops, we may, perhaps, estimate the amount to be charged in the Punjab cultivator's account for cost of extra fodder at 1,000,000*l.* annually.

The next two items, *repair and renewal of agricultural implements* and *keeping well gear in order*, can be conveniently taken together. With wood, clay, and material for ropes procurable *gratis* from the farm, or on the common, the cost is not heavy, and may be generally resolved into the making of certain customary grain payments to the potter, carpenter, and blacksmith, and the purchase of a little leather

---

* The above description applies to the ordinary peasant; some of the better class of villagers and headmen indulge in more expensive custume. In lieu of native cloth, they array themselves in calico from Manchester, with long tight drawers reaching to the ankle, using for turbans and for girdles fine-woven *lunghis* or scarves with ornamental borders. In the cold season they wear outer robes of *pattu*, or of camels' hair, embroidered on the edge and sleeves, or wrappers of fine wool from Hazara, Kulu, or Kashmir; while their ladies, on festal occasions, adorn themselves with veils of spangled muslin, and vests, skirts and trowsers of silk from Bokhara or Khorassan.

† For further information, see Mr. Baden Powell's "Punjab Manufactures" (Lahore 1872), p. 323, *et seq.*

* Tobacco can hardly be considered a necessary of life in the case of the Punjab cultivators, seeing that the most stalwart and healthy of our peasantry—the Jat Sikhs—do not smoke at all; but as they would appear to solace themselves for their deprivation by free indulgence in opium and spirits, it may be as well to admit a moderate amount of tobacco into the recognized dietary of the agriculturists. Judging from the amount of tobacco produced and imported, the value of the tobacco consumed in the Punjab per head of population, exclusive of the Sikhs, must amouut to 9*d.* annually, or if divided amongst adult males, to 2*s.* 6*d.*; but to this must be added 1*s.* 3*d.* as the cost of the molasses with which tobacco for smoking is invariably mixed; but there is undoubtedly a good deal too much of the hookah amongst our cultivators, and if I allow to each adult male an annual expenditure of 3*s.* per head on smoking, I shall be allowing as much as is good for him. The cost of moderate smoking will thus amount in the aggregate to 400,000*l.* out of the 2,000,000*l.* allowed for miscellaneous expenses, leaving a margin of 1,600,000*l.* for oil and other household contingencies and little luxuries.

† Settlement Report of Dera Ghazi Khan, pp. 135–6.

IP. I. QN.13.

PUNJAB.

. *Thornton.*

and iron. Judging from the reports of settlement officers, these charges will be covered, in the case of land irrigated by wells, by about 4*s*., and in the case of other cultivated land, by about 2*s*. 6*d*. per acre annually, the total cost for the province being for well lands 800,000*l*., for other lands 2,200,000*l*., or 3,000,000*l*. in all.

Manure is required for sugar-cane, cotton, Indian corn, poppies, turmeric, tobacco, and garden crops, and is applied to other products also in the vicinity of villages and wells; but, save in the neighbourhood of large towns, it is seldom bought or sold, and the expense of manuring is generally resolvable into cost of carriage and a small grain payment to the village sweeper. The area under crops for which manure is obligatory amounts in the Punjab to about 2,000,000 acres, and the area actually manured may be estimated at double that amount. A lump sum of 600,000*l*. may be allowed to cover this and other farming contingencies, including 180,000*l*. on account of water supplied for irrigation from Government canals.

The total cost of cultivation, exclusive of cost of seed grain, labour, and ordinary feed of cattle, will thus amount on the average to 5,600,000*l*. a year.

Another item remains to be considered, that of *taxes*. Reserving the general subject of taxation for a later stage of our inquiry, it may be here noted that the only indirect tax to be included in the *necessary* expenditure of the agriculturist is the salt tax, for he can exist comfortably without spirits or opium, or fine clothes from Manchester, and this tax has already been included in the cost of food; of direct taxes he has to pay (1), the Imperial land tax, falling at the average rate of 1*s*. 10½*d*. per cultivated acre, and (2), various rates and cesses for defraying the cost of district roads, education, village police, famine insurance, and other local charges, amounting, in the aggregate, to 4½*d*. per acre, the total for the province being, in round numbers—

	£
Land tax - - - - -	2,000,000
Local rates and cesses -	400,000
Total - - -	2,400,000

IV.

Such being the receipts and expenditure of the Punjab agriculturists, their account will stand as follows:—

	£
Value of produce - - -	42,000,000
Deduct—	£
Cost of food - - - - -	15,000,000
Clothing - - - - -	3,000,000
Repairs, tobacco, and miscellaneous household expenses - - -	2,000,000
Cost of cultivation other than cost of labour, seed grain, and ordinary feed of cattle - - -	5,600,000
Land tax and local rates and cesses -	2,400,000
Total -	28,000,000
Balance in favour of agriculturists -	14,000,000

Let us now test the correctness of this calculation by dealing with the matter somewhat more in accordance with reality. Instead of deducing a subsistence rate from the cost of feeding prisoners, let us allow from the produce of the land an amount sufficient for the comfortable subsistence of the peasant population, and see what is the value of the surplus. Again, taking our liberal gaol dietary as the standard of healthy subsistence,* we have the following result:—

	Average Amount produced (after Deduction for Seed) in Lbs. (000,000's omitted).	Required for Food of Agricultural Population (000,000's omitted).	Surplus for Sale in Round Numbers (000,000's omitted).	Value of Surplus at Average Market Rates.
				£
Wheat - - - - - - -	4,960	1,100	3,860	9,650,000
Inferior Grains, viz., Barley, Maize, and Millet - -	4,600	3,390	1,200	2,000,000
Pulses - - - - - - -	1,240	620	600	1,400,000
Meat - - - - - - -	300	165	135	1,200,000
Vegetables - - - - - -	1,200	730	470	300,000
Condiments - - - - - -	100	47	53	420,000
Ghee and Butter-milk - - - -	†128	47	81	2,000,000
Milk and Curds - - - - -	256	160	96	300,000
Tobacco - - - - - -	74	44	30	120,000
				17,390,000

To the value of the surplus produce shown in the above table, we must add—after like deduction for seed—

	£
Value of rice crop - -	3,200,000
„ oil seed - - -	940,000
„ cotton - - -	940,000
„ sugar-cane - -	1,692,000
„ indigo - - -	180,000
„ poppy - - -	50,000
„ miscellaneous - -	1,440,000
„ hides and skins -	800,000
„ wool - - -	800,000
„ of cattle sold - -	1,500,000
„ firewood and timber -	3,500,000
	15,042,000
Making the total value of produce for sale - - - -	32,432,000
Or in round numbers - -	32,000,000

Deducting from this—

	£
(1.) Ten per cent. as the difference between market and village prices -	3,200,000
(2.) Cost of clothing - - -	3,000,000
(3.) Cost of salt, oil, and miscellaneous household expenses - - -	2,000,000
(4.) Cost of cultivation other than cost of seed, labour, and ordinary feed of bullocks - - - -	5,600,000
(5.) Taxes (Imperial and local) -	2,400,000
Total -	16,200,000
We have a balance of - -	15,800,000

---

* Although I have taken the gaol dietary as the standard of healthy subsistence for the Punjab population, I do not wish it to be understood that it represents the dietary of the well-to-do classes in all parts of the Punjab; in some localities and by some castes more grain is consumed and less meat, and *vice versâ*. Some few tribes, such as the *Bhabarahs*, wholly abstain from meat; others, especially the Mahomedan tribes on the frontier, consume it in large quantity.

† Exclusive of butter-milk.

Again, let us test our conclusions by another process. In the Punjab the proprietor frequently takes his rent, not in money, but in kind, leaving the tenant cultivator a share of the produce sufficient to support himself and family and cover all expenses of cultivation. If, therefore, we can ascertain the share of the produce left to the most favoured class of cultivating tenants, we shall have another means of gauging the cost of living and cultivation on admittedly comfortable terms. Fortunately this information is available, for among the Punjab Government's statistical returns for 1875–76 is one of great interest and value, entitled "Statement of Tenures not held direct from Government," which gives *inter alia* a return of the proportion of the crop taken by proprietors from all classes of cultivating tenants. From this statement it appears that in the case of the most privileged class of tenants (viz., those with right of occupancy), the proportion left to the tenant is generally two-thirds of the crop, but very often less—in some cases less than half the crop.* We might, therefore, fairly assume the value of two-thirds of the crops of the Punjab as a very liberal provision for all the expenses of its peasantry; but for safety's sake let us go further; let us assume the cost of cultivation and comfortable living to be represented by the value of *three-fourths* † of every class of crop. The average market value of the crops of the Punjab being, as we have seen, 36,000,000*l.*, and their average value to the producer ten per cent. less, or 32,400,000*l.*, three-fourths of this latter sum, or 24,300,000*l.*, will accordingly represent the money value of the share we have assigned for cost of cultivation and subsistence; if to this amount we add the sum of 2,400,000*l.* for taxes (Imperial and local) and deduct the total (26,700,000*l.*) from 42,000,000*l.*, a balance remains of 15,300,000*l.*

We have thus arrived by three different processes at an estimate of the profits of the Punjab agriculturists; the calculation being made in each case on the principle of giving the agriculturists the benefit of every doubt, and avoiding everything approaching to exaggeration of receipts or under-estimating of charges. Of these three processes, one brings out an average profit of 14,000,000*l.*, another of 15,800,000*l.* while the third, which is perhaps the most practical and reliable, an average profit of 15,300,000*l.* We are, therefore, in a position to assert with some confidence that, after liberal provision has been made for the necessary food, clothing, and household expenses of the entire agricultural population, the cost of cultivation and all taxes, Imperial and local, there will remain in ordinary years to the peasant proprietors of the Punjab a balance of profit from the land of *at least* 14,000,000*l.* sterling, a balance available for meeting losses in bad years, payment of interest on loans, and thereafter for expenditure at discretion on English calicoes and other luxuries, improved accommodation, extension of cultivation, and last, not least, upon gold and silver ornaments and marriage feasts.

V.

At this point an English reader may be tempted to remark, "It is all very well to talk about the "agricultural community of the Punjab obtaining a "nett profit from the land of 14,000,000*l.* per annum; "the sum appears large when stated in the lump, "but if divided amongst the agricultural population, "it amounts after all to little more than a profit of 6*l.* "per family."

The criticism is a very natural one; but in estimating the value of this sum to its recipients it is necessary to remember that in a society where a pair of shoes can be bought for 9*d.*, a suit of clothes for 3*s.* 3*d.*, where meat costs 2*d.* and flour a halfpenny a pound, a plough 5*s.* and a harrow 10*d.*, and where other articles of ordinary use are proportionately cheap, a profit of 6*l.* is equivalent to a profit of at least 60*l.* in England. How many English peasants save 60*l.* a year?

Another point has to be borne in mind, namely, that our calculation of the profits of the agriculturist has been made on the supposition that grain is fairly cheap; but should it happen, as it has not unfrequently happened of late years, that the price of produce rises, not from failure of the local harvest, but in consequence of extensive exports, then the cultivator's profits increase rapidly. If grain produce rise in price by as little as one seer (2 lbs.) in the rupee, he gains, in the case of wheat, an additional profit of 1*s.* 3*d.* on every acre's produce sold, and in the event of a general rise to that amount the agricultural community of the Punjab is richer by 500,000*l.* Of course in a country like the Punjab, dependent for more than two-thirds of its agricultural produce upon a very uncertain rain-fall, the reverse process not unfrequently takes place; but owing, it may be presumed, to the steady improvement of our communications, the *general* tendency of prices for the last 20 years has been to *rise.**

But we have not yet finished with the income of the agriculturists. Besides the profits realized from the land, the cultivating proprietor or tenant makes no inconsiderable gain from hiring out his cart in the slack season for transport of goods or merchandise, while agricultural labourers earn large sums by working on canals, railways, and other public works. At the present moment large numbers of the peasants are receiving as much as 9*d.* a day for earth-work.

Then many a peasant has a son or brother or other member of his family in the service of the Government as sepoy, policeman, or revenue official, or employed upon the railway, who contributes from his earnings to the common stock; some 200,000 hold the office of village headman, receiving a commission of five per cent. on all taxes they collect, while not a few of our peasant proprietors are the happy possessors of a plot of revenue free land.

Lastly, should any peasant proprietor desire to improve his holding, to increase his income by sinking a well, constructing an embankment, or other work of permanent utility, he can obtain a loan from Government at six per cent. per annum.

But here a political economist will perhaps offer a remark: "Granted that profits from the land "in the Punjab may amount to a considerable sum, "pray, how is the amount distributed? For it is "possible to have a wealthy landed interest side by "side with an impoverished agricultural popula-"tion."

---

* The following are the details:

Of tenants paying rent in kind there are—

I. Tenants-at-will—	
(1.) Paying ½ produce and more - -	295,273
(2.) " less than ½ produce - -	230,465
II. Tenants with right of occupancy—	
(1.) Paying ½ produce and more - -	41,248
(2.) " ⅓ produce and less than ½ produce	47,588
(3.) " ¼ " " ⅓ "	25,408
(4.) " ½ " " ¼ "	9,286

† The liberality of this assumption may be measured by the fact that in Italy, where the standard of living and cost of cultivation are, from climatic and other reasons, far higher than in the Punjab, the share of the produce left to the *metayer* tenant is usually *one-half*—in Tuscany as little as *one-third*. In Northern Russia, where the soil is far from rich, while the cost of living and cultivation is greatly enhanced by the rigours of the climate, the *metayer* tenant retains, according to Huxthausen, only half the produce. In the Native States of the Punjab the share of the produce left to the cultivator, is, as a rule, far less than in British territory.

* Take, for instance, the price of wheat; from 1858 to 1861 it rose steadily from 41 lbs. a shilling to 18 lbs. a shilling; from 1861 to 1863 it fell, but only to 31 lbs.; from 1863 to 1869 it rose steadily to 14½ lbs.; between 1869 and 1876 it again fell, but only to 25 lbs.; in 1877 it again rose. But the tendency of prices to rise, irrespective of the effects of drought, is better exemplified in the case of crops usually requiring irrigation, and thus more or less independent of rain, such as rice, sugar, and cotton. The price of rice has risen with inconsiderable fluctuations from 17½ lbs. a shilling in 1857 to 9 lbs. a shilling in 1877, or nearly 100 per cent.; of unrefined sugar from 14 lbs. a shilling to 11 lbs. a shilling, or by 20 per cent.; cotton steadily from 4 lbs. a shilling to 3 lbs., or 25 per cent., except during 1863–64, when it rose to 2½ lbs. a shilling. Meanwhile, be it remembered, the land tax has been almost stationary.

I: Qn. 13.

NJAB.

Thornton.

To this very pertinent inquiry I can reply, on the authority of the tenure statement above referred to, that the profits are as widely distributed as they well can be with benefit to the community. In the Punjab there are no millionaire proprietors; indeed, there are but nine individuals in the whole province whose land tax exceeds 500*l.* per annum. Of the entire agricultural population—

- 2,000,000 are proprietors of land in common or in severalty, with an average holding of 13 acres of cultivated and fallow land, exclusive of rights in the uncultivated area, the proprietor, as a rule, cultivating seven acres himself, and letting the remainder to tenants on the *metayer* system;
- 500,000 are tenants with right of occupancy, with holdings averaging six acres;
- 1,200,000 are tenants-at-will, with holdings slightly smaller;

and the rest of the agricultural population is composed of the families of the above-mentioned classes, and a limited number of farm-labourers. As a rule, the produce of six acres will support an agricultural family in comfort. In a community so constituted the benefit of any general increase of wealth derived from land, whether owing to rise of price or the introduction of more valuable staples, is felt not by a few great capitalists only, but by almost every member of the agricultural population.

But here it may be urged, by some new critic, fresh from the pages of the *Nineteenth Century*: "Granted "that your peasants may realise great profits, and that "these profits are theoretically well distributed, is it not "true that they are all pledged to the village banker? "And is it not the case that the ancestral lands of the "peasant population are passing with terrible rapidity "from the possession of the hereditary owners into the "hands of the money-lending class?"

To this important question a complete answer can fortunately be given. Those who require a reply in detail will find it in the published Administration Reports of the Punjab Government for the last four years. In this place it will suffice to mention the principal facts which those reports record. It is there shown that of the cultivated area of the province comprising, with fallows, 25,000,000 acres, less than one-fourteenth part is under mortgage—no less than 23,240,000 acres being unencumbered;[*] that the number of suits for debt against the agriculturists of the Punjab is far less in proportion to population than the number of debt-suits in England; for while in the Punjab one agriculturist out of 110 is annually sued for debt, in England one person out of 22 has yearly to undergo that unpleasant operation; that transfers of agricultural land, so far from being alarmingly frequent, are, in proportion to the extent of acreage, singularly few and unimportant; the sale of ancestral land by decree of court being, indeed, almost unknown, while, in spite of tempting prices, the amount transferred by private sale is less than one acre per annum per square mile of assessed area, of which by-the-bye, the greater portion passes into the hands, not of money-lenders, but of agriculturists; that the average selling price of land has risen steadily from four years' purchase of the land revenue demand in 1859 to *thirty years'* purchase in 1876–77, and that nearly the same amount can be raised by mortgage as can be raised by sale.[†] It is shown, in short, by statistics procured from every district in the province, that the peasant proprietors of the Punjab, so far from being, as a body, insolvent or oppressed with debt, are eminently prosperous; being not only, as we have already seen, the recipients of an average surplus income of at least fourteen millions sterling, but blest with an available, but unused, credit at their bankers for nearly sixty millions more.

What, then, it may be asked, is the practical and visible result of this agreeable state of things? The result it may be answered, can be seen in the steady increase of cultivation which has taken place of late years in the Punjab; the extension of the irrigated area by means of private capital, the increased production of more valuable crops, the gradual substitution of masonry dwellings for mud huts, of brass for earthen vessels, in increased expenditure on silks and metals, in large consumption of goods from Manchester,[*] in decreasing applications for loans from Government, and in the general contentment, loyalty, and thriving aspect of the population. It is seen also in the fact that, notwithstanding a large export of grain in 1876, the markets were so overflowing that there was danger of a glut; that, in spite of a total failure of the autumn harvest of 1877, there was no general distress in the Punjab, and that, after an export of 400,000 tons of grain in 1877–78, wheat was selling at 15 lbs. a shilling.

A word regarding *taxation.* The Imperial and provincial revenues and receipts of the Punjab amounted in 1876–77 to 3,630,000*l.*; adding to this amount 200,000*l.* on account of sea customs duty collected at the ports on articles consumed or used by the people of the province, and deducting, on the other hand, the following items:—28,000*l.* paid as tribute by Native States; 80,000*l.*, sugar export duties, paid by foreign consumers, 130,000*l.* postal receipts, a reasonable charge for service immediately rendered; 160,000*l.* canal water rate, an optional payment for an article supplied; 90,000*l.* forest receipts, and 55,000*l.* gaol receipts, proceeds of goods sold or labour supplied, and 41,000*l.* fines for criminal offences, we have the following result, viz., that the sum taken by the State from the pockets of the people for general purposes of administration amounted, according to latest information, to 3,246,000*l.*, falling at the rate of 3*s.* 3½*d.* per head of population. If to this be added 400,000*l.* on account of local rates and cesses, the sum total of Imperial and local taxation combined will not exceed 3,646,000*l.*, falling at the rate per head of only 3*s.* 8¼*d.*

After what has been said above, it is hardly necessary to observe that the weight of taxation in the Punjab, even in the case of the agricultural population, who pay the lion's share, is anything but "crushing." The indirect taxes, salt, excise, and customs, are included in the cost of living and paid insensibly; the land tax[†] which in Sikh times varied from one-half to one-third, is now nominally one-sixth, but practically about one-sixteenth of the value of the produce. Moreover, in Sikh times, stock and dairy produce was taxed, and sometimes heavily; it is now practically untaxed, for the assessment of grazing lands is nominal.[‡] As for local rates and cesses I can perhaps best indicate their lightness by stating that the ordinary cultivator can defray them all, including Sir John Strachey's famine insurance rate,—and improve his constitution into the bargain,—by reducing his smoking to three pipes a day, or, if he be a Sikh cultivator who does not smoke, by a slight reduction in the amount of his potations or of his daily allowance of opium or post.* But while the pressure of the local taxes is thus hardly felt, the benefits derived from them are immense, though not always as much valued as they ought to be. From local taxation the cultivator is provided with roads to his market, which he thoroughly appreciates; postal communication with the headquarters of the district and the Imperial postal lines, which he is beginning to appreciate; and education for his children,—which I fear he does not as yet appreciate at all. He is provided, besides, with a hospital within reach, a watchman, and the services of a surveyor and accountant.

---

[*] Compare with this the situation in England, where, according to Mr. Laveleye, mortgages amount to 58 per cent. of the value of the land, and in Lombardy, where they amount to 25 per. cent.; even in France, the paradise of peasant proprietors, one-tenth of the land is said to be under hypothecation.

[†] In Flanders, says Mr. Laveleye, the selling price of land has doubled since 1830. "These results," he adds, "are not equalled in any other part of Europe." In the Punjab the selling price of land has more than trebled in less than half the time. In 1864 it averaged 11*s.* an acre; it now averages nearly 40*s.*

[*] See Appendix.

[†] For brevity's sake I have used the word land tax to denote the Government revenue derived from land; but, as frequently pointed out, the land-revenue of India is not really a tax any more than the revenue of Crown lands in England is a tax. It is the portion of the rent taken by the State in virtue of its position as proprietor in chief of the soil—a position inherited by the British Government from its predecessors, the Moghul Emperors, and held by it in common with every Eastern potentate. But even if it be regarded as a tax, it is, in the Punjab, a very light one, as will be seen from the succeeding note.

[‡] As some critic may complain of my going back to Sikh times for a standard of comparison, I venture to give a few examples of the rate of the land tax in civilized countries at the present time. In Italy, according to a writer in the *Spectator* for the 16th November 1878, the landowners have to pay a tax on their *prediali* amounting on the average to thirty per cent. of their incomes—the proportion being, in some cases, more than forty per cent. According to Mr. Zincke's article in the *Fortnightly* for November, the peasant proprietor

But another objector may arise and say, "It is all "very well to prove statistically that the peasantry of "the Punjab are lightly taxed and prosperous, but "your statements are so *very* satisfactory that you must "pardon me for doubting their correctness. Have "you seen, with your own eyes, the prosperity you so "logically describe?"

To this direct appeal, if made, I can reply as follows: "I know every district in the Punjab. I "have watched its progress with deep interest for many "years, and from many points of view—as a judicial, "as an executive, as an administrative officer,—and I "know that my story, though widely different from "Mr. Hyndman's, is substantially correct. I do not, of "course, claim for the Punjab the attributes of Para- "dise. There, as in more favoured regions, are to be "found some cases of depression and distress; there, as "elsewhere, the people have their grievances, and vast, "indeed, is the room for progress and improvement; "there are villages which suffer from over-population; "there are villages which suffer from over-irrigation; "some villages there may be, but very few, in which "the land tax presses; there, as elsewhere in India, "inundations, cattle disease, locusts do their work "of destruction; and epidemic disease, in the shape "of cholera and the *cohors febrium*, is not unknown. "Then as to grievances, there are grievances about "forest conservancy (a form of civilization not appre- "ciated by the people), grievances about canal water "supply (especially in the matter of having to pay for "it), grievances about grazing lands, grievances about "sanitary laws; moreover, though, as a body, the "peasantry are flourishing, there are, doubtless, indi- "vidual cases of embarrassment; and, in the event of "a failure of the harvests, there is a residuum of the "agricultural population, possessing little or no land, "which readily succumbs. But the cases of distress "are exceptional, and the grievances are not serious, "and, take it all in all, I venture to assert with confi- "dence that Her Majesty has few subjects more "well-to-do (in their small way), few more contented, "few more well affected, than the peasant cultivators "of the Punjab."

"If specific instances of visible improvement are required, they can be given in abundance. In the year 1858 I visited the battle field of Chillianwallah. There was then but little cultivation, and the eye wandered for miles and miles over an expanse of dreary jungle. In the spring of 1870 I again visited the locality in the suite of the late Lord Mayo. The scene was completely changed. The dreary jungle had become a sheet of cultivation interspersed with groves of trees. So great, indeed, was the transformation that an officer on the staff, who had been present at the battle, failed to recognize a single feature in the landscape. Again, when marching through the Multan district a few years ago, I had the good fortune to be accompanied by an English officer who had been employed in that part of the Punjab since 1850. As we proceeded deputations of well-dressed villagers came out to welcome us, many of them mounted on excellent horses, with velvet-covered saddles and gold and silver trappings. 'How different was the scene,' observed my companion, 'when I went 'over this ground in 1850. In those days every 'village seemed in the last stage of poverty, even the 'headmen being scantily clothed in the coarsest cloth. 'As for horses, such a thing was not to be seen, and 'if, here and there, we met with a mounted headman, 'he was mounted, not on a caparisoned steed, but on 'the bare back of a half-starved pony, with a bit of 'old rope doing duty for a bridle.' Again, in Yusafzai, on the Peshawar border, I traversed during 1865 miles and miles of *maira*, or uncultivated waste, all of which is now under the plough; indeed so far back as 1870, the officers of the Guide Corps were bitterly complaining of the disappearance of the florican, and the curtailment of the hunting grounds owing to the rapid increase of cultivation. Again, on the western frontier, I have frequently seen villages surrounded with waving crops, extending for miles up to the extreme limit of British territory, and have been assured that, 20 years ago, all beyond matchlock-range of the hamlet was uncultivated and desolate. Many are the other instances I could give of visible improvement in the circumstances of the Punjab cultivators during the last 20 years, but space and time, and respect for the patience of my readers prevent my pursuing this agreeable subject further."

So much for the past and present—one word as to the future of the province. Of land comprised within the surveyed boundaries of villages, there are upwards of ten millions of culturable acres as yet untilled; should these be brought under the plough or otherwise fully utilized, or should individual villages desire relief from over-population, there are nine millions of acres of culturable waste at the disposal of the State available for the formation of new settlements; and out of these nine million acres, more than two millions have water within irrigable distance from the surface of the soil. In addition, moreover, to these culturable acres, there are tens of millions of acres now unculturable, but destined to become of immense value when the waters of the Indus, the Jhelam, and the Chenab shall have been brought to fertilize the almost rainless tracts on the west and south of the Punjab. With a large area for extension of cultivation, a fairly fertile soil, great capabilities for irrigation, an increasing population, a growing trade, and a railway to its natural port, Kurrachee—the future of the Punjab is one of abundant promise.

VII.

Before concluding, I must notice another count in Mr. Hyndman's general indictment. He asserts that the productive power of the soil of India is and has been steadily deteriorating. This *may* be the case; indeed theorists contend that it *must* be the case; but I have seen no evidence worth a moment's consideration that it really *is* the case. Of course, it is possible to produce instances here and there of lands exhausted by over-cropping, or defertilized by over-irrigation, but

---

in the Limagne pays for house and lands comprising 6 *hectares* or 15 acres, taxes to the amount of 6*l.*, or 8*s.* an acre, yearly, besides 3*d.* on every bottle of home-made wine he sells. If comparison be made between the Punjab and Native States, the difference in favour of the Punjab cultivator is striking. In Cashmere the recent cash settlement was made on the principle of the State being entitled to the value of sixty-three per cent. of the gross produce. In Bhawalpore, which is being temporarily administered by British officers, the taxation, after being immensely reduced under our auspices, falls at the rate of 8*s.* per head of population. In Egypt, according to Mr. McCoan, the land tax falls, in the case of ordinary tenures, at the rate of 22*s.* per acre.

* An ordinary cultivator, with a holding of six acres, pays in local rates and cesses about 2*s.* 4*d.* annually; but, as we have already seen, he expends 3*s.* 9*d.* on his *hookah*, which he smokes, on an average, nine times a day. A Sikh cultivator will not unfrequently expend annually on spirits or opium, or both, a sum sufficient to pay, not only his local taxes, but a large portion of his land tax in addition. The superior sturdiness and vigour of the Sikh cultivator, who drinks freely, but does not smoke, as compared with the Mahomedan cultivator, who smokes freely, but does not drink, is certainly a "fact" for the Anti-tobacco Association. *Post* is a decoction from the poppy, much favoured by Sikhs, especially of the Cis-Sutlej districts.

I. Qn.13.

JAB.

hornton.

of *general* deterioration of the soil in the Punjab, there is, to the best of my knowledge and belief, no proof whatever deserving of the name. Meanwhile, I can mention, on the high authority of the present Lieutenant-Governor of the province, a fact which hardly favours such a supposition, namely, that the average yield of wheat in unmanured land in the Punjab, as ascertained by a series of experiments, is *greater* than the average yield of wheat in unmanured land in England—the former being 880 lbs. per acre, the latter 843 lbs. only.

VIII.

To sum up;—my answer to Mr. Hyndman's general indictment is, in the case of the agriculturists of the Punjab, that he has greatly under-estimated their income; that he has greatly over-estimated their cost of living; that he has assumed a general impoverishment that does not exist; and a general deterioration of the soil that is not proved; that the peasant population of the Punjab, so far from being on the road to bankruptcy and ruin, are on the high road to increased prosperity and wealth.

T. H. Thornton.

Calcutta, January 1879.

Appendix.

In support of my statements made regarding the prosperous condition of the Punjab peasantry, I subjoin a few statistics taken from official reports and returns:—

1. *Increase of cultivation.*—Returns of cultivated area in the Punjab are prepared every five years, the first published being that for the year 1868–69.

The Return for 1868–69 gives the cultivated area of the province as 20,171,558 acres.

The Return for 1873–74 gives it as 22,640,889 acres.

Thus the cultivated area of the province was increased in five years by nearly two and a half millions of acres; or, to put the matter more familiarly, a new tract of country was brought under the plough equal to five counties of the size of Surrey.

2. *Extension of irrigation by means of private capital.*—The statistics of irrigated area are also prepared quinquennially. The Returns for 1868–69 and 1873–74 give the following information:—

—	1868–69.	1873–74.	Increase.
AREA IRRIGATED.	Acres.	Acres.	Acres.
(1.) By Government canals -	1,372,987	1,618,854	245,867
(2.) By private works (*i.e.*, by wells, watercourses, or canals constructed by or at the expense of agriculturists).	4,611,904	5,000,481	388,577
TOTAL - -	5,984,891	6,619,335	634,444

Thus between 1868–69 and 1873–74 the irrigated area was increased by means of private capital to the extent of 388,577 acres, or 607 square miles. In other words, in the space of five years the peasant cultivators of the Punjab brought under irrigation, and thus secured from drought, at their own expense, a tract of country twice the size of Middlesex; or, to put the matter still more strikingly, they brought under irrigation in five years an area greater than that watered by the *Bari Doab* Canal; a work which has been upwards of twenty years under construction and has already cost nearly 1,500,000*l.* sterling.

3. *Increased cultivation of the more valuable crops.*—Returns of the principal crops of the Punjab are published annually; from these returns I have compiled the subjoined statement showing the development of the cultivation of the following staples, *wheat, oil seeds, sugar-cane,* and *indigo,* between 1868–69 and 1876–77.

—	1868–69.	1869–70.	1870–71.	1871–72.	1872–73.	1873–74.	1874–75.	1875–76.	1876–77.
	Acres.	Acres.	Acres.	Acres.	Acres.	Acres.	Acres.	Acres.	Acres.
Wheat - -	5,577,005	5,654,637	5,402,473	5,366,977	5,716,867	5,820,861	6,025,771	6,282,687	6,609,497
Oil seeds - -	439,155	462,430	610,416	540,140	638,905	722,648	739,167	838,794	846,689
Sugar-cane - -	325,831	342,605	370 195	333,657	372,824	374,125	297,136	383,029	391,630
Indigo - -	32,444	82,039	61,439	67,736	72,674	89,959	118,815	84,333	129,465

Thus the cultivation of wheat and sugar-cane has increased in nine years by about 20 per cent., that of oil seeds has nearly doubled, and that of indigo quadrupled. It may be added that the area under tea has increased from 5,521 acres in 1868–69 to 10,046 acres at the present time.

4. *The gradual substitution of masonry dwellings for mud huts* cannot, unfortunately, be proved by statistics, but it is a matter of common observation; the substitution of *metal for earthen vessels,* and I may add of imported steel for native iron in the manufacture of plough shares, is not only a matter of observation, but is evidenced by the increase which has taken place of late years in the amount and value of metals, and metal manufactures imported. *See* next paragraph.

5. *Increased expenditure on silks and metals, and large consumption of goods from Manchester.*

The following statements compiled from the Punjab trade returns will be of interest. It is to be regretted that the information cannot be given from an earlier date, but, unfortunately, arrangements for registering the trade of the province were not completed until 1873–74.

(1.) *Metals and metal manufactures* (exclusive of railway material, machinery, and bullion).

YEAR.	IMPORTS.		EXPORTS.	
	Weight in Maunds of 80 lbs.	Value in £s.	Weight in Maunds of 80 lbs.	Value in £s.
		£		£
1874–75 -	177,378	255,843	44,831	67,163
1876–77 -	265,939	355,661	52,265	85,073

(2.) *Silk and Silk goods.*

CHAP. I. QN. 13.

PUNJAB.

Mr. Thornton.

(3.) *Piece goods (European).*

YEAR.	IMPORTS.		EXPORTS.	
	Weight in Maunds 80 lbs.	Value at 12*l.* a Maund.	Weight in Maunds.	Value at 12*l.* a Maund.
		£		£
1874–75 -	341,474	4,097,688	61,711	740,622
1876–77 -	353,964	4,247,568	78,212	938,544

From the third of the above tables it will be perceived that the value of the cotton goods from Europe, imported into the Punjab for home consumption, amounts (at 12*l.* a maund, a rate of valuation fixed by the Punjab authorities after very careful inquiry) to about 3,300,000*l.* annually. Deducting from this sum 20 per cent. for cost of carriage and dealers' profits, the balance, 2,640,000*l.*, will represent the seaport values of the goods consumed in the Punjab. But the total value of cotton goods imported into India amounts, after deduction of re-exports, to 18,000,000*l.* annually. It would therefore appear that, in spite of remoteness from the sea-board, the Punjab, with a population equal to about one-thirteenth of the population of India, consumes upwards of one-seventh of the cotton goods imported. The returns for 1877–78, just received, show a falling off in the piece goods trade, but this was to be expected in view of the almost total failure of the autumn rain crop of 1877, and the depressed state of trade with Cabul and adjacent countries.

Note on Mr. Thornton's criticism on Mr. Hyndman's Article.

Mr. Elliott.

1. *Mr. Thornton's method.*—Mr. Thornton has confined himself to the consideration of the economic condition of the agricultural population of the Punjab, leaving the non-agricultural population to be dealt with in another paper. He has calculated the produce raised by them, their necessary consumption, and the surplus remaining for comfort or luxury; and he has made this calculation in two ways: first, assuming that they sell everything which they raise and buy everything which they consume; second, assuming that they consume what they require of their home-raised crop, and sell the surplus.

2. *The census figure for "Agriculturists" questioned.*—The first datum required for such a calculation is the number of the agricultural population, and this figure Mr. Thornton has taken from the census report. I venture to think that the census statistics can hardly be trusted implicitly in such a matter as this. According to them, the agricultural population was 55 per cent. of the total, or 9,683,000 out of 17,611,000; and Mr. Thornton has assumed that since the census was taken in 1868 the population has increased to 20 millions (an increase of 13·5 per cent.). and the agricultural to 11 millions (an increase of 13·6 per cent.). This assumption is extremely doubtful; but it is not my present purpose to enter in that subject. The urban population of the Punjab was 1,972,000, leaving the rural population at 15,639,000, of whom only 9,683,000 are engaged in agricultural pursuits; so that if the census statistics may be trusted, there are 6 millions of people living in the Punjab villages who neither own land nor cultivate it, nor labour on it for wages. Surely the experience of those who have been long engaged in district work, and who know how few people there are in the villages who are unconnected with the land, would lead them to suspect that there must be some error here.

3. *Comparison with the statement of landed tenures.*—The suspicion is strengthened by an examination of the census figures. Those who are returned as agriculturists are divided among the following classes:—

Proprietors - - - -	5,876,067
Tenants - - - -	3,245,469
Labourers - - - -	318,845
Shepherds - - -	109,585
Graziers - - -	57,429
Herdsmen - - - -	76,169

To these, at any rate, should have been added the jaghirdars, 46,408 in number, who are only proprietors under another name.

But the statement of landed tenures for the Punjab, drawn up for the year 1875–76, gives the following figures:—

Proprietors or shareholders in estates	2,445,018
Tenants (number of holdings) - -	1,677,486

What do these figures represent? If the same procedure is followed in the Punjab as in the North-Western Provinces, in regard to the record of proprietors, the name of the head of the family only is entered while he is alive, but if he dies leaving a widow and children the names of all of these are entered; so that the 2,445,018 cannot stand for heads of families, but for some smaller figure, and should perhaps be multiplied by $2\frac{1}{2}$ to obtain the population it represents. On this hypothesis the proprietory population is 6,110,000, or say 6 millions. But the number of tenants' holdings represents in most cases an entire family: their average area is 6 cultivated acres, which can hardly be tilled by less than one adult male, assisted by his family, and thus the tenant population would be $4\frac{1}{4} \times 1,667,000$, or 7,127,000. Add to these the 562,000 labourers, shepherds, &c., of the census and we have an agricultural population of 13,800,000, or nearly 90 per cent. of the rural population. This is the same proportion as I have arrived at in a separate calculation as the true percentage in the North-Western Povinces.

4. *Numbers classified as non-agriculturists, but engaged in agricultural pursuits.*—There is another way of considering the question. Mr. Thornton has included, among articles raised by the agricultural population, milk and its products, wool and hair, hides and skins, meat, animals for draught or dairy purposes, and timber for building and fuel. Now it is obvious that many of these articles are raised by other classes than those enumerated in the census among the agricultural population. Among the non-agriculturists I find milkmen who must probably have something to do with raising as well as selling milk; butchers who breed cattle for slaughter as well as buy them; carpenters, woodsellers, and charcoal-sellers who cut as well as sell timber and fuel; tanners or chamars who strip the hides off dead cattle without any reference or remuneration to the late owner, the agriculturist. All these ought to be added to the agricultural classes, if the value of their wares is to be entered as an agricultural product; besides which it is well known that there is a vast number of people who combine agriculture with some other profession. Blacksmiths, masons, carpenters, potters, barbers, washermen, salt and saltpetre makers, oil pressers, grain-dealers, and grain-parchers, weavers, petty shopkeepers, priests and pandits—all these, besides their special hereditary profession, very often own or cultivate a little bit of land, and thus swell the list of tenants in the statement of landed tenures. But I have dwelt sufficiently on this subject in my note on the agricultural population of the North-Western Provinces, which I propose to submit to Mr. Thornton for his consideration, as an appendix to these remarks.

5. *Suggestion as to true figures for agricultural population.*—On the whole, then, I should be inclined

to suggest that the proper classification of the Punjab population of 1868 would be somewhat on this wise:—

Urban	1,972,000
Rural—engaged in agriculture only	10,000,000
engaged partly in agriculture and partly in trade	3,800,000
non-agricultural	1,800,000

If any such hypothetical allowance is to be made for the supposed increase of population since 1868, as Mr. Thornton has made, then the agricultural population (including those partly engaged in trade) should be raised to 15,600,000.

6. *Difficulty of separating agriculturists from non-agriculturists.*—But the very fact that there does undoubtedly exist in every province of India such a mixed class as I have described seems to me fatal to the possibilty of arriving at the truth by the method Mr. Thornton has adopted. We cannot separate the agricultural population in any such distinct way as he has done from the non-agricultural so as to be able to say: this is the value of the articles produced by such a class, and, deducting their consumption, there is so much surplus. If we attempt this, we either fall into the error which I venture to think Mr. Thornton has fallen into, and attribute to 11 millions the products raised by the labour (at least the partial labour) of 15 millions; or we should fall into the opposite error, and assume that the 15 millions produced nothing but agricultural produce, whereas a certain number of them also earn part of their livelihood by their trade as weavers, carpenters, smiths, &c.

7. *Another method suggested. Classification into rural and urban.*—A truer hypothesis would perhaps be that all the rural population live off the products of the land, exchanging their wares among each other by a simple process of customary barter without any need of coin. The agriculturist does not, I submit, pay to the leather-worker 400,000*l.* a year for his shoes; he gives the chamar the hides of dead cattle free; he gets as many shoes from him as he wants, and he pays him by a fixed quantity of grain at harvest-time. The carpenter and smith are paid in the same way for making and repairing agricultural implements; the village weaves makes clothes, and the shepherd weaves blankets; the washerman and the potter work for the village in which they were born, and their fathers worked on the same terms, that is, payment of a fixed quantity of grain per plough, or per house, or per acre, or per well, as the custom may be. All these are fed off the land; they rarely save anything; their wage is practically the measure of their consumption. They are dependents and hangers-on of the agriculturist, and he on his part has no occasion to pay for clothes, for house repairs, for field implements, or house utensils, any more than if he grew them. The whole rural population may thus be taken as homogeneous, all its ordinary wants being supplied from the land. The only true class-distinction that can be drawn is, I conceive, that between the urban and the rural population. To the town goes the surplus food-grain and almost all the non-food-produce of the land, by the sale of which the agriculturist pays his rent or revenue and buys his luxuries—English cloth, refined sugar, spices and salt, and so forth. Of course this assumption is not absolutely correct any more than the other; the town population comprises a few who are actually agriculturists and till the lands surrounding the town, and still more who are the dependents of agriculturists, weaving and working for them in return, not for a price, but for a customary fee, just as the village artizans do. But, on the whole, it seems to me safe to say that the great majority of townspeople either live on their rents and private incomes, or else live by trades which mainly consist in exporting the surplus raw produce of the country, and in retailing to the rural population the finer articles of use and luxury which the villages cannot produce.

8. *Application of this method.*—I think, then, that a fairly correct estimate of produce, consumption, and surplus can be made on this assumption; and I propose to draw out the calculation accordingly, following as far as possible Mr. Thornton's method, except in a few details where I shall offer reasons for adopting a different conclusion from his. Accepting Mr. Thornton's hypothesis that the population has increased to 20 millions (though, as I have said, it appears to me a very doubtful one), the urban population will be 2 millions, the rural 18.

9. *Food crops.*—Mr. Thornton states the main agricultural products of an average year thus:—

	Acres.	Rate of production per acre.	Outturn in tons.	Value in rupees.
Food crops -	17,535,000	691 lbs.	5,412,500	—
Non-food crops -	3,465,000	Rs. 21–10	—	7,50,00,000

Major Wace, in the reply to the Famine Commission drawn up by him on the basis of the latest information and statistics possessed by the Financial Commissioner's office, gives the following figures:—

	Acres.	Rate per Acre.	Outturn in tons.
Food crops -	18,500,000	644 lbs.	5,488,240
Non-food crops -	2,600,000		

With regard to the food crops, it is perhaps best to accept Major Wace's figures as being specially prepared by an expert, with an express view to the discussion of this subject; whereas Mr. Thornton's figures were apparently taken from Administration Reports and, though official, had been less carefully considered. Major Wace gives no estimate of the value of non-food crops. Mr. Thornton's estimate comes to Rs. 21–10 per acre, or Rs. 56,160,000 in all; and this seems to me low. I shall make some remarks on the details as they come under discussion in the course of this note.

10. The next point is, the quantity consumed for food. Mr. Thornton's estimate (derived apparently from the jail ration) of the annual quantity consumed per head on an average of the whole rural population is as follows:—

Dry grain, including pulses -	465 lbs.
Meat -	15 „
Vegetables -	66 „
Spices and condiments -	4¼ „
Ghi and buttermilk -	4¼ „
Milk and curds -	15 „
Tobacco -	4 „

The estimate of 465 lbs. of dry grain seems to me rather low when it is considered—(1) that there is loss on all grains and much loss in the case of the smaller millets in converting them to flour; (2) that a great portion of the rural population are engaged in hard work in the open air, and are therefore always hungry, and are well enough off to satisfy their appetites; (3) that the Punjabi is generally a big man, and eats more than an average Hindustani; but it agrees closely with the calculation of Major Wace and the Punjab Government, which place the consumption at 20 oz. per head per diem; and I do not therefore propose to raise it. The quantity consumed by the 18 millions will at this rate be 3,736,000 tons. The seed-grain is calculated by Major Wace to be 402,000 tons. The loss by wastage and dryage is estimated at 5 per cent. on the total produce, or 274,400. The consumption by cattle is a point on which very little is known with exactitude. Major Wace remarks on it as follows:—

"The agriculturists do not usually feed their cattle with grain, but the townspeople do, to a certain extent, especially their cows. The drivers of bullock carts always feed their cattle with two or three seers of grain, when working. Bullocks, ponies, and mules are similarly fed when carrying pack-loads. And there is a certain very limited consumption in feeding up cattle and sheep for slaughter. It is difficult to put the consumption, under these various heads, as less than 6,000,000 maunds per annum, of which two-thirds is consumed by draught and pack cattle."

This calculation must be accepted for want of a better; but as part of the cattle thus fed belong, as already mentioned, to townspeople, I roughly set down the consumption of the rural cattle at 5,000,000 maunds, or 183,800 tons. The account with the dry grain or food-crop produce will therefore stand thus:—

		Tons.
Total outturn - - - -		5,488,240
Deduct—		
	Tons.	
Food of people - -	3,736,000	
„ of cattle -	183,800	
Seed-grain - -	402,000	
Wastage - -	274,400	
		4,596,200
Surplus - - - -		892,000

The value of this surplus, taken at Mr. Thornton's average market rate, or Rs. 58 per ton, is Rs. 5,17,36,000.

The surplus is accounted for thus:—

	Tons.
Food of the urban population at the same rate as the rural -	415,000
Food of cattle belonging to them	36,700
Average exports - - -	166,000
	617,700

leaving a difference of 275,000 tons unaccounted for. This is not a large quantity out of so vast a sum total as we are dealing with, being only 5 per cent. Moreover, the consumption of the townspeople has been reckoned as only equal to that of the villagers, whereas it is known to be considerably greater. In the North-Western Provinces it is estimated at 7 maunds a head, or 500,000 tons for the urban population. Allowing a margin for slight errors, the value of the surplus crops to the rural population may be set down as fifty millions of rupees.

11. *Meat.*—The next item in Mr. Thornton's list is meat. Under the conditions of the problem as now put, we need not enter into the value of the meat raised and consumed by the rural population; we have only to do with what they sell to the townspeople. Mr. Thornton calculates that these latter consume 15 lbs. a head per annum, and that it costs them 2*d.* per lb. Then, the 2 million townspeople consume 30 million lbs. of meat, most, though not quite all, of which they buy from the rural population, and they pay for it 2½ million rupees. But a large portion of this is the price paid for the butcher's labour. The actual price paid to the grower* is probably about two-thirds of the price of the meat; so that the rural population can only be credited with 1⅔ million of rupees as the money-proceeds of the cattle they sell for slaughter.

12. *Vegetables.*—Mr. Thornton's paper gives the area cultivated with garden vegetables as 200,000 acres; the average crop as 6,000 lbs. or 75 maunds per acre, and the value as Rs. 40. Major Wace gives the area as 250,000 acres, but he adds no estimate of produce. Mr. Thornton's estimate of produce seems to me rather large. In the North-Western Provinces, where the cultivation is, generally speaking, higher than in the Punjab, Mr. Buck puts it at 50 maunds, except in the case of potatoes, for which he allows 100 maunds per acre. The total produce of 250,000 acres would be, at Mr. Thornton's rate, 1,500 million lbs.; 20 million people at 66 lbs. a year would consume 1,320 million lbs. As there is hardly any provincial export of such perishable articles, the crop produced must approximately equal the consumption; so the one ought to be raised to 75 lbs. per head per annum, or the other lowered to 5,300 lbs., or 66 maunds per acre. In either case, all that we have to deal with is the quantity sold by the rural to the urban population. At 66 lbs. per head, this would be 132 million lbs., valued at Rs. 8,80,000; in the other case, at 75 lbs. per head, it would be 150 million lbs., valued at Rs. 10,00,000. In such a calculation as the present one, the difference is not very important.

13. *Spices and condiments.*—Mr. Thornton's area under spices and condiments is 200,000 acres, the estimated produce 500 lbs. per acre, and the value Rs. 40 per acre, or 12½ lbs. per rupee. Major Wace's area agrees with the above. Of these articles, there appears to be no net export in ordinary years, and the provincial consumption should equal the production. Mr. Thornton's rate of 4¼ lbs. per head per annum gives a total consumption of 85 million lbs. for the province, while the production is 100 million lbs. But there is good reason, from general knowledge of their habits, for thinking that the townspeople consume spices and drugs to a much greater extent than the country people. Moreover, the municipal statistics of the North-Western Provinces have led that Government to the conclusion that the annual urban consumption of these articles is in value from Re. 1 to Rs. 1-4 per head, so that it is a moderate estimate to put it at 12 lbs. per head. We should have then—

18 millions @ 4¼ lbs. - 76½ million lbs.
2 „ „ 12 „ - 24 „ „

which exactly accounts for the estimated production. The value of the 24 million lbs. sold by the rural to the urban population is 2 million of rupees.

14. *Ghi and milk.*—Mr. Thornton estimates the consumption of ghi to be 4¼ lbs. a year for agriculturists, but he states that the town consumption is 8 lbs. as shown by the octroi returns, and this figure agrees almost exactly with that of the North-Western Provinces municipalities. The townspeople therefore require 16 million lbs., valued at 4 million rupees. Mr. Thornton states that the provincial net imports of ghi are worth 8 million of rupees. If so, the conclusion would be that the rural population not only do not sell any ghi to the town, but require to buy some for their own consumption; and this is hardly credible. The Annual Administration Report for 1877-78 (page 115) states the total value of ghi imported for the three previous years at Rs. 13,13,000, and the total value exported at Rs. 19,68,000, which gives an annual net export of Rs. 20,00,000 worth. Assuming that these figures are correct, and that Mr. Thornton has made a slip, the rural population make Rs. 40,00,000 from the townspeople and Rs. 200,000 from exports, total Rs. 42,00,000 by their ghi. Of milk, at Mr. Thornton's estimate of 15 lbs. a head, the town require 30 million lbs., worth a little less than one million of rupees.

15. *Tobacco.*—Mr. Thornton puts the area cultivated with tobacco at 74,000 acres, the average produce at 1,000 lbs. per acre, and the price at 37 lbs. per rupee, or less than Rs. 30 per acre. This is much below the North-Western Provinces' estimate. At the rate of 4 lbs. per head, the consumption of the province is 80 million lbs., while the out-turn is only 74 millions. The North-Western Provinces' estimate of urban consumption is 8 lbs. per head. Mr. Thornton states that some tobacco is imported (the Annual Report states it as 3,200,000 lbs. per

---

* The Punjab reply to the *Questionnaire* of the International Statistical Congress gave the average estimated weight of a sheep when slaughtered as 13½ seers. Now the price paid for a sheep varies probably from Re. 1 to Rs. 1-8, or say 1¼ annas per seer, or 1⅛*d.* per lb.

CHAP. I. QN. 13.

PUNJAB.

Mr. Elliott.

annum), and that the Jat Sikhs do not smoke, but they are only 6·5 per cent. of the entire population.* Taking the North-Western Provinces' rate, the townspeople consume 16 million lbs., worth rather less than half a million of rupees. Deducting the import from this, we may put the amount sold by the rural population at 13 million lbs., value Rs. 3,50,000.

16. *Sugar.*—Sugar is an item of consumption hardly touched on by Mr. Thornton, who alludes only to "occasional sweetmeats," which he includes among the head of miscellaneous. The North-Western Provinces' estimate of consumption is 30 lbs. of coarse sugar, and 10 to 12 of fine sugar per head of town population. The rural population buy very little fine sugar, but they make their own coarse sugar. The area under sugar-cane is put by Major Wace at 350,000, by Mr. Thornton at 374,000 acres; and the latter estimates the production at 1,600 lbs. per acre (600 million lbs. in all), worth 33 lbs. per rupee, or Rs. 48 per acre. This is very much below the North-Western Provinces' estimate (in Shahjahanpur over 4,000 lbs. of "rab" is produced per acre), and is undoubtedly too low. At 30 lbs. per head, the whole produce, 600 million lbs., would be required for the use of the province in coarse sugar alone, leaving none for refining or for export. Ten lbs. of fine sugar are made from 30 lbs. of coarse, so that, if each person consumed at the rate of the North-Western Provinces' municipal estimate, they would require 1,200 million lbs. They do not, however, consume as much in the villages, but enough has been said to lead to the conclusion that Mr. Thornton's estimate of production is too low. But we are now concerned only with the urban consumption and the export. The two millions in the towns consume 60 million lbs. of coarse, and 20 million of fine sugar, or 120 million lbs. of coarse sugar, reducing the two kinds to a common denominator. The average net imports during the last three years† have been 14 million lbs. of refined, and 20 million lbs. of coarse sugar, which is equal to 62 million lbs. of coarse sugar. The net sales by the rural to the urban population are therefore 58 million lbs. of coarse sugar, worth a little less than two million rupees.

17. *Oil. Oil for lighting.*—This subject also is hardly touched by Mr. Thornton. The North-Western Provinces' municipal estimate of consumption is 4½ seers of oil; and, allowing that the village consumption is less, it may be put at four seers, or 8 lbs., of oil per head per annum, or 32 lbs. of oil-seeds, value about one rupee. The Punjab will therefore require 640 million lbs. of oil-seeds for its own use. It also exports this article largely, the average export* of the last three years being 970,000 maunds, or 77½ million lbs. The total production must therefore be about 720 million lbs. Adding on for seed-grain and wastage, the production must be 770 million lbs. But Mr. Thornton only credits it with 300 million lbs. grown on 720,000 acres. The explanation of this decrepancy is no doubt (as pointed out by Mr. Buck in his paper on the North-Western Provinces' production) that, in the majority of cases, oil-seeds are not grown by themselves, but mixed in small quantities with wheat and barley and other such crops. However, the townspeople take 64 million lbs. of oil-seed, and the export trade take 77½ million lbs.—total (say) 140 million lbs., worth 4¼ million rupees, or Rs. 42,50,000 to the rural population who raise them.

18. *Clothing materials. Clothing.*—Mr. Thornton estimates that the cost of cotton and woollen clothing, and of shoes, comes to Rs. 2·72 a head for the agriculturist. Of this, about Rs. 2 goes for cotton clothing, 4 annas for woollen clothing, and 8 annas for shoes. But while the country people mostly wear native-woven cloths, townspeople mostly wear English-woven cloth, and it is difficult to make an estimate of what the value is of cotton supplied to the town either for woven wear or for wadded quilts. Raja Lachman Singh's estimate for the North-Western Provinces was 3 lbs. 10 oz. of cotton, worth about Rs. 1-12 per head; and this included the urban poor—say half the urban population. Considering how much cotton is used for wadded clothes in the colder climate of the Punjab, it would not be perhaps excessive to adhere to this estimate, or, for safety's sake, we may put the consumption of native cotton by the townspeople at three lbs., or, say, at present prices, 8 annas a head.

As to the shoes, which Mr. Thornton prices at 8 annas, the rural population will only receive the price of the leather, or, say 4 annas, the rest being chargeable to workmanship; thus, for cotton, wool, and leather they will receive from the urban population 1 rupee a head, or 2 million of rupees. Besides this, there is an annual export of about 2 million rupees' worth of cotton, and the same value in wool, and about 3 millions of rupees' worth of hides and leather, of which perhaps two-thirds would be the price of the raw material. The total receipts of the rural population, therefore, from cotton, wool, and leather will be about 8 millions of rupees.

19. *Timber and Fuel.*—Mr. Thornton reckons that the timber imported into town is worth Rs. 22,00,000; and the fuel required for 2 million of people is worth 4½ million rupees. But this price includes the cost of labour in felling and splitting and of carriage, and a very small portion of it, I conceive, reaches the owner of the land on which the timber or wood grew. Adding in, as Mr. Thornton does, 4 million rupees for the price of timber used for public works and furniture, and fuel for locomotives, manufactories, &c., I should doubt if, out of the total 11 millions, 2 millions of rupees reached the producer.

20. *Indigo, Poppy, and Miscellaneous.*—There remain the three non-food crops, indigo, poppy, and "miscellaneous," which cover an area of 916,000 acres according to Mr. Thornton, 200,000 acres according to Major Wace; and the value of their produce is estimated at about Rs. 20 an acre. The rate is a fair one, and the value (adopting Major Wace's acreage) is 4 millions of rupees.

21. *Summary of Receipts.*—The receipts of the rural population from their surplus produce may then be summed up thus:—

	Rs.
Food crops - - -	5,00,00,000
Meat - - - -	16,66,000
Vegetables - - -	10,00,000
Spices and condiments - -	20,00,000
Ghi and milk - - -	52,00,000
Tobacco - - -	3,50,000
Sugar - - - -	20,00,000
Oil - - - -	42,50,000
Clothing materials - -	80,00,000
Timber and fuel - -	20,00,000
Indigo, poppy, and miscellaneous - - -	40,00,000
	8,04,66,000

Deducting 10 per cent. for the difference between village and market prices, the surplus amounts to 72 millions of rupees. This comes to Rs. 4 a head, or about Rs. 20 a family, if spread over the whole rural population. These profits, however, will accrue not to the labourers, shepherds, carpenters, &c., but for the most part to those who possess rights and interests in the land, and who number, as calculated in paragraph 3, about 13¼ millions. Their profits will thus be about Rs. 5-8 a head, or Rs. 24 a family.

22. *Necessary Expenditure and common Luxuries.*—There are only two items of necessary expenditure that have to be set against this income. The first is revenue and local cesses, which Mr. Thornton states

---

* Census Report, paragraph 28.

† Administration Report for 1877-78, page 115.

Chap. I. Qn. 1.

Punjab.

Mr. Elliott.

amount to 24 millions of rupees. The next is salt, which, at the jail ration (calculated as in page), is consumed at the rate of 9 lbs. per head, or 162 million lbs. per annum. This will cost them about 9 million rupees. There are two other sources of expenditure, the purchase of refined sugar, and of English-woven cloth, neither of which is, strictly speaking, a necessity, though they are so universally bought that they deserve to be taken into account. The English piece-goods imported (net) into the province are worth 34 millions of rupees a year. The town consumption of these at Rs. 6 a head is 12 million rupees, leaving 22 million rupees' worth to be used by the 18 million of rural population or more than Re. 1 per head; which seems a high estimate, though I have no other data to check it by.* For refined sugar, again, I know of no statistics to show the amount consumed by the rural population; but, as a mere guess, putting it at half the amount with which the town residents have been credited, or 5 lbs. a head, it amounts to 90 million lbs., or about 13 million rupees.

23. *Summary of Expenditure.—Balance struck.*—The expenditure on necessaries not produced in the villages, and on common luxuries, and in taxes, is as follows:—

	Rs.
Land tax and cesses - -	2,40,00,000
Salt - - - - -	90,00,000
Refined sugar - - -	1,30,00,000
English cloth - - -	2,20,00,000
	6,80,00,000

leaving only about four million rupees as surplus profits from direct agricultural produce, available for savings, or for expenditure on other luxuries.

24. *Conclusion.*—I offer this estimate with the more diffidence because I have no local knowledge of the Punjab, and because I have ventured to differ in some respects from so distinguished an authority as Mr. Thornton. If my method is an unsound one, I have no doubt its error will be exposed by the criticism to which it will be subjected; if it is sound, I trust that those who have the local knowledge, which I do not possess, will assist me, by correction of any erroneous details, to work out a fairly accurate calculation of the economic condition of the rural population of the Punjab.

25. The difference between the outcome of our two calculations is this: Mr. Thornton takes the *agricultural* population at 11 millions, and attributes to them a profit of 140 million of rupees. I take the *rural* population at 18 millions, and attribute to them a profit (after paying for necessaries and taxes) of 39 millions of rupees, derived solely from the land, over and above the profit derived from other occupations which a large portion of them pursue side by side with agriculture; and out of that 39 millions I reckon that 35 are spent on common luxuries, leaving only four for hoarding. The margin is no doubt a small one, but the estimate provides amply for all the necessaries of life, and there must be a considerable profit for the larger landowners when the whole rural population can be shown to be well supplied with the means of living.

---

* Except an inquiry made by Mr. Moens in Bareilly, who found that 430 agricultural persons bought Rs. 243 worth of English cloth in the year. This is hardly 8 annas a-piece. (Settlement Report, page 50).

NORTH-WESTERN PROVINCES.

North-Western Provinces.

Mr. Elliott.

The land revenue of the North-Western Provinces and Oudh is assessed on each village, and is fixed for a period of 30 years. The fixing of the land revenue is called a settlement. The first 30 years' settlements were carried out generally between 1835 and 1840; and the revision of these settlements for a second period of 30 years began about 1860, and though finished in most districts, is still going on in four. In Oudh the settlement was taken in hand shortly after the Mutiny of 1857 had subsided, and it was concluded, with the exception of some revising operations, about 1877.

2. The principle of the first 30-year settlement in the North-Western Provinces was that Government was entitled to take as its share $\frac{2}{3}$rds of the gross average rental of the land, leaving to the landowners $\frac{1}{3}$rd of the rental, besides the ordinary profits of cultivation. But in 1854 the general standard of comfort had risen so much, and the opinion prevailed so widely that it was for the good of the country that a larger margin of profit should be left to the landowners, that the Government of the time decided to lower the land revenue at the next assessment to 50 per cent. of the gross rental. But still the increase in the cultivated area had been so large between 1840 and 1870, and the rise in rents due to higher prices and to increased competition so considerable, that in most districts the half of the rental of 1870 has proved to be more than two-thirds of that of 1840.

3. In estimating the gross average rental of a village, the main duty of the Settlement Officer is to ascertain the actual facts; that is, to find out what rents are really paid by cultivators to landlords, and, by applying similar rates to lands which are not rented but are held as home farms, let at low rates to relations, &c., to calculate what sum of money the whole estate would bring in if it were all rented. A good deal of land is rented below its real value, from reasons which belong to the past history of the village and the relations between landlord and tenant in former times. The Settlement Officer has to estimate what would be a fair rent on such lands, and he does this by classifying the soil according to its qualities and productive powers, and by ascertaining, over large tracts of homogeneous land, what rates of rent cultivators pay on an average on each class of soil where no special causes for leniency exist. In this way the full average rental of a village or an estate is calculated; and whether the landlord collects the whole of that sum as rent, or is pleased to remit any portion of it to the tenants or others, half of it is taken by the Government as land revenue.

4. The table below shows for the North-Western Provinces the difference between the old and new assessment, as far as the latter had been made on 30th September 1878, and for all districts the incidence of the land revenue on the cultivated area. The incidence on different classes of soils need not be stated here. It will be found in the settlement report for each district; and a large collection of the rates is given in pages 40–62 of the appendices to Mr. A. Colvin's "Memorandum on the revision of land revenue settlements in the North-Western Provinces" (1872). The classification of land is too various and complicated to convey any meaning, except to the mind of an expert. Speaking very roughly, however, the following figures may be mentioned as shewing the rates at which the land revenue falls on the more ordinary classes of the soil:—

	Rs. per acre.
Good land near the village site, highly manured and irrigated - - -	4 to 6
Good land at a little distance from the site manured occasionally and irrigated -	2 to 4
Good outlying land, irrigated - -	$1\frac{1}{2}$ to 3
Good unirrigated land, at a little distance from the site, occasionally manured -	1 to 2
Good outlying land, unirrigated - -	1
Sandy ditto ditto - -	$\frac{1}{4}$ to $\frac{1}{2}$

IAP. I. QN. 13.

NORTH-WESTERN PROVINCES.

Mr. Elliott.

In the suburban lands of large towns, Rs. 10 or 12, and even Rs. 20, per acre would not be an excessive rate of assessment.

N.B.—The districts marked * were still under assessment in 1878.

5. These settlements have been made with great care and elaboration by a picked set of officers selected as being the most capable of the younger members of the civil service; and there can be no doubt that on the whole the assessments fixed by them do accurately represent a fair half of the gross average rental. Some, no doubt, are lighter, and some heavier; the most questionable cases are either those where rent is taken in kind and an estimate of its average money-value has to be formed, or else where the crops vary so violently with the fluctuations of the seasons that the average is peculiarly hard to strike. But, on the whole, the incidence is acknowledged both by the collectors of the districts and by the best informed native gentlemen to be fair and equable, and the revenue is collected with ease and punctuality.

6. The proportion borne by the land revenue to the estimated value of the annual gross produce was shown in the discussion of question 3 to be about 13 per cent., or between $\frac{1}{7}$ and $\frac{1}{8}$.

7. The following principles have been prescribed for fixing the dates at which instalments of revenue are payable:—that the cultivator should not be bound to pay his rent until a little time has elapsed after his main crops have become ripe, so as to allow him to sell in an open and not a forced market a portion of that crop; and that a month after the landowner can demand rent from the cultivator, the revenue should become due from him to Government. If the date is fixed too early, *i.e.*, before the crop is ripe or is harvested, the cultivator has no cash in his hands, and is forced to borrow. If it is fixed too late, an improvident cultivator may be tempted to dispose of his cash before the landowner comes to demand it. It is necessary to choose a judicious medium between these two errors.

8. Another consideration to be borne in mind is this,—that the rent ought to be paid as far as possible out of crops which the cultivator sells, not out of those which he would naturally keep for his own consumption. The rain-crops which ripen earliest, such as the light coarse millets, the coarser rices, and the Indian corn, are almost entirely grown for home-consumption, and, broadly speaking, all the rain-crops (except indigo and cotton) are grown for food rather than for sale, and a much smaller proportion of these than of the spring crops (wheat and barley) comes into the market at all.

9. The cultivator receives more cash, therefore, in the spring than in the autumn, besides which he has also to buy seed in the autumn at the rate of about 100 lbs. to the acre for the winter crops. It follows, therefore, that for the autumn rent the cultivator has more occasion to borrow than for the spring rent, unless due consideration has been made in fixing the instalment. When a proper arrangement has not been made, it generally occurs that the cultivator has to borrow not only money for rent, but grain for seed. Money is lent at half an anna per rupee per month, which is equivalent to 37½ per cent. per annum. Seed is borrowed at different rates. Sometimes it has to be repaid in kind *plus* 50 per cent., so that if a cultivator borrows 10 maunds in October, he must return 15 in April; sometimes the *value* of the seed-grain has to be repaid with 50, or more commonly with 25 per cent. additional, at harvest, and the lowest rate of interest ever charged is half an anna per rupee per month. Grain at sowing time is always dearer than at harvest time; so that if 10 maunds are lent in October when grain fetches (say) Rs. 3 a maund and returned in April when grain fetches (say) Rs. 2 a maund, the cultivator has to pay 15 maunds, worth Rs. 30, *plus* interest, Rs. 5–10, to clear off his debt. Everything ought to be done, therefore, to prevent the cultivator being thus mulcted.

10. So far the question has been treated with regard only to cultivators' interests. But financial interests are also much concerned. If at one season a very large tract of country is called upon to supply the Government treasuries with hard cash, there is a sudden demand for silver coin which drains the market and affects circulation. The cash is meanwhile locked up and doled out month by month in payment of the various military and civil establishments of the country. It would therefore be convenient, from a financial view, that collections should be made at different dates in different parts of the same district, and this is what would occur if homogeneous tracts and villages were in practice treated as the settlement rules intended that they should be treated.

11. Mr. Buck gives the following examples to illustrate the way in which the instalments can be brought into relation with the crops:—"The crops of a village A being divided into crops eaten by cultivators and crops sold, it is found to sell on an average Rs. 800 of rice in August, and Rs. 1,200 of sugar in January, and to eat the rest. The most convenient arrangement would be to require rent to be paid in the following proportions:—

Charged against rice - - 40 per cent., 15th Sept.
Ditto sugar - 60 „ „ 15th Feb.

Suppose another village, B, is found to sell Rs. 1,000 worth of indigo and cotton in October and November, and Rs. 1,000 worth of wheat and oil seeds in March and April, the arrangement might be—

Charged against indigo - 20 per cent., 1st Nov.
Ditto cotton - 20 „ „ 1st Dec.
Ditto wheat and oilseeds - 60 „ „ 1st May.

12. It is evident, however, from the replies sent in from the different districts that as yet these principles have not been effectually carried out. This has been due, partly to the difficulty of ascertaining the individual necessities of each village, partly to the fact that the principle above enunciated was only laid down in 1874, when most of the settlements had been completed. The previous system had rather been in the direction of treating both landowners and cultivators as children, assuming that the money would burn a hole in their pockets, and that it must be collected from them almost before they had got it, certainly not a day after. The instalments have now, as a general rule, been put back, so as to give everyone a better opportunity of realising a fair market-price; but they are still too uniform, and instead of varying with every village, or at least every homogeneous tract of country, they are often fixed for identical dates throughout a whole district, although it may consist of very distinct tracts, growing different kinds of crops, which ripen at different seasons.

CHAP. I. QN.
NORTH-
WESTER
PROVINCE
Mr. Elliot.

13. Another reason why collectors have made no objections to the existing arrangements is this, that the person with whom the collector has to deal being the landlord, the main difficulty does not present itself to him. Landlords, as a body, are only too glad to pay under a system which is inconvenient to the tenant and which gives them, the landlords, firstly, the opportunity of charging interest on arrears of rent, which interest never forms part of a recorded rental, and is, therefore, never charged with revenue; secondly, the opportunity of ejecting tenants who cannot pay, and of thus destroying their occupancy rights. Under these circumstances, it is natural that landlords should not object to the old system of fixing the instalments too early, and should not specially desire the introduction of the new system.

14. Mr. McConaghey, Collector of Banda, remarks that he "would certainly advocate that both the dates "and the proportions of the instalments should be "settled after consideration of the special and "general circumstances of each village, and should "not, except the circumstances are precisely the "same, be uniform for considerable areas." This view embodies the principles laid down in the settlement rules. What is now necessary is that each collector should be required by the local rules under the Act to make such alterations in the dates and amounts of the instalments as now fixed as will meet the circumstances of each part of his district which requires different treatment from any other part.

BENGAL.

BENGAL.
Mr. Toynb

13. *Incidence of Land Revenue, &c.*—The general incidence of land revenue on the cultivated area, estimated as explained in the answer to question 3, is shown in Statement I. district by district. The incidence on different classes of land cannot be given; nor is the amount of their gross produce known with anything approaching to accuracy. The figures in columns 3 and 5 have been worked out in accordance with the general plan of this report; but it cannot be too often repeated that they possess *per se* no statistical value whatever. Bengal and Behar being permanently settled under the Regulations of 1793, no re-adjustment of the land revenue, however desirable it might be, is possible. The settlement of Orissa expires in 1879. Of late years there has never been any practical difficulty in realising the land revenue in Bengal, nor in Orissa, except during the years following the famine, when Rs. 15,84,391 were remitted, the condition of the remission being that the zamindars should give a corresponding remission of rent to their ryots. It would be strange, indeed, if it were not so, considering the difference between the amount of the Government demand on, and the gross rental of, the land in Lower Bengal. The following figures exhibit this difference in a very striking light. The figures for "rental" include the rental of revenue-free and of some of the rent-free lands which are not exhibited separately in the returns. Fuller details will be found in Statement II.

Division.	Government Revenue (per Year of Valuation.	Gross Rental.
	Rs.	Rs.
Burdwan - - -	79,74,891	1,85,40,026
Presidency - -	51,16,523	1,42,35,364
Rajshahye - -	48,65,840	1,59,30,574
Dacca - - -	39,71,399	1,91,25,288
Chittagong - -	12,43,749	59,58,881
Patna - - -	80,26,164	3,73,48,552
Bhagulpore - -	31,60,941	1,15,05,324
Orissa - -	17,36,845	40,19,130
Chota Nagpore - -	3,01,102	37,15,796
Total - -	3,63,97,454	13,03,78,935

No stronger argument than the above figures could be brought forward to show that State expenditure in times of scarcity should be resorted to as seldom and as sparingly as possible. The difficulty lies in the attempt to place the burden on the right shoulders.

The instalments of revenue, which are *due* according to the original agreements made at the time of the permanent settlement, are now *payable* only on the following dates, without reference to the time of harvest:—

In Bengal, 12th January, 28th March, 28th June, and 28th September.

In Behar, 12th January, 28th March, 7th June, and 28th September.

In Orissa, 28th April, 8th November.

In the Chittagong district there are five kists, and in Darjeeling and all the districts of Chota Nagpore, where the sunset sale law (Act XI of 1859) is not in force, there are no fixed dates for payment, except such as are specified in the landlord's agreement. It is the above fixed dates of payment which now chiefly regulate the collections of rent by landlords.

No interest is charged on arrears of land revenue. The unrelenting nature of the Government revenue demand, without reference to the goodness or badness of season, although it does not now lead to wholesale transfers of landed property, yet may have the evil effect of making both the poorer land-owning and the cultivating classes to some extent dependent on the money-lending classes. The high interest charged by these latter renders it difficult for their debtors, even in a good season, to extricate themselves from the debts incurred in a bad one, and when two or more bad seasons follow one another they become involved.

AP. I. QN. 13.

BENGAL.

Chap. I. Qn.13.

Central Provinces.

Mr. Nicholls.

CENTRAL PROVINCES.

Incidence of Land Revenue.—At the time of settlement, owing, perhaps, to the paucity of irrigation, the assessments were fixed by a classification of soils, and no distinction was made between irrigated and dry cultivated lands. Nor can I now attempt to show separately the incidence of the land revenue on such different classes of land.

The following statements (A.) and (B.) show the incidence of the land revenue on the cultivated lands, and on the culturable malguzari lands, and its proportion to the gross produce calculated on the present cultivated area,* valued, *first*, at the rates prevailing at the settlement time, and, *secondly*, at the rates of the present day.

---

* See statement of area of cultivation under Group 3, page 104.

(A.)—Statement showing Land Revenue, Acreage Rates, and Value of Gross Produce at Time of Settlement.

Districts.	Value of Food Grains.	Value of Oil-seeds.	Value of Sugar-cane.	Value of Cotton.	Value of other crops.	Total value of produce.	Total Land Revenue assessed.	Average rate per acre.		Proportion the Land Revenue bears to value of gross produce.

CENTRAL PROVINCES.

Mr. Nicholls

I offer the following observations:—

The assessments were made between 1863 and 1869, except for Sambalpur, for which a ten years' summary settlement has recently been concluded. At the time of the assessments, owing to the increased cotton cultivation due to the American war, to the opening up of the country by roads, the progress of railway works, large exports of grain to Berar and Bombay, also to Malwa and Hindustan in times of local scarcity and other extraneous causes, prices of agricultural produce ruled high, and were not expected to continue. As a matter of fact, from 1870 to 1876 they generally fell. Now, again, owing to the vast exports of wheat and oil-seeds to Europe, and to the drain caused by famine in Madras, Bombay, and the Nizam's dominions, they are exceptionally high. The produce out-turn shown in statement (A.) for the time of the settlement is calculated for a good year, but on the present acreage. I have kept the same out-turn figures for the gross produce of the present day, but have in the second statement (B.) valued this at the present market rates. But it is obvious that with the recent increase of cultivation we now have a considerably increased gross produce over that which was obtained at the time of settlement; consequently, the proportion of land revenue at the time of settlement to the value of the gross produce was heavier than that shown in statement (A.). Of course it is highly improbable that our present prices will be maintained; but on the other hand, our aggregate increase of production, coupled with the substitution of more valuable for inferior crops, will render the proportion of land revenue to the value of gross produce shown in my second statement a fair index of our present condition as regards the incidence of the land revenue demand, and not very greatly in excess of what we may expect in the immediate future.

It was the especial work of the Settlement Officers to accurately adjust the revenue demand according to the capabilities of the different classes of land, and it is neither desired nor desirable to alter their excellent work in any way, even were it possible to do so.

The work of assessment was carried out from 1863 to 1869; in Sambalpur in 1876 and 1877.

There has been no practical difficulty in realizing the land revenue as now assessed. In a very few individual villages of Damoh, Murwara, and Bhandara, slight over assessments have been long ago corrected. There is now no difficulty whatever.

The dates at which the instalments of revenue are payable, and their relation to the ordinary period of harvest or of realization of rents, are as follows:—

—	Harvests.		Payment of rents.		Payment of kists.	
	Kharif.	Rabbi.	Kharif.	Rabbi.	Kharif.	Rabbi.
Nagpur	December, middle of.	April, middle of.	December, end of.	April, end of	15th Jan.	15th May.
Wardha	Do.	Do.	Do.	Do.	Do.	Do.
Chanda, with Upper Godavari Sub-division	Do.	Do.	Do.	Do.	Do.	Do.
Bhandara	November	Do.	Do.	Do.	Do.	Do.

Bilaspur	Do.	Do.	Do.	Do.	Do.	Do.
Sambalpur	Do.	Do.	Do.	Do.	Do.	Do.

The Government demand is paid for each village in exact proportion to its kharif or to its rabi cultivation, and rents are collected exactly on the same basis. No interest is charged.

BERAR.

BERAR.

Mr. Dunlo

With respect to the proportion borne by the land revenue to the value of the gross produce the information is limited, and not very reliable, owing to the difficulty of ascertaining the actual value of produce per acre. Major Szczepanski estimates that the land revenue in the Wun district bears a proportion of about $\frac{1}{8}$ to the value of the gross produce.

Mr. Beynon, in his Settlement Report on the Chandur taluka (Amraoti district) in 1873, made the following estimate:—

"According to the present market prices the average rate of 13 annas 10 pies is equivalent to a grain rent per acre of 55½ lbs. of jowari, and 3lbs. of cleaned cotton. Taking the average yield per acre of these staples to be 400 seers of jowari and 45 lbs. of cleaned cotton, the average Government demand for the entire taluka under the proposed rates represents about $\frac{1}{14}$ and $\frac{1}{13}$ of the gross produce respectively. This is irrespective of the straw and cotton seed, both valuable commodities; so there can be no doubt, notwithstanding the large increase in revenue, that the average pressure of the proposed settlement will be very light."

The revenue is payable in two instalments, the first of which is due on the 15th January, and the second on the 15th March.

The kharif crops are reaped in December, and the spring crops in February, and the above dates are quite convenient for the agriculturists, many of whom voluntarily pay their whole assessment in January.

IAP. I. QN. 13.

BERAR.

Mr. Jones.

Owing to its small size, its compact area, and its general homogeneity of soil, population, and productions, Berar affords peculiar advantages for the prosecution of some of the inquiries which the Commission propose to themselves to make. I will give an instance. We have in Berar an almost perfect measure of the pressure of our land revenue assessment. Attempts have often been made to arrive at such a measure in other provinces; but I have never seen any which I could regard with even a moderate amount of confidence. In Berar we produce an article, cotton, which supplies such a measure, because—

(*a*) it is produced on a sufficiently large scale:

(*b*) it is all (except what is retained for home consumption, a quantity which, if not accurately ascertained, is certainly comparatively insignificant) exported by railway; and every pound exported is therefore known:

(*c*) our imports are extremely small and are known:

(*d*) the price of cotton is known:

(*e*) the area under cotton is known.

The following extract from the Cotton Report, submitted with my letter No. 3,549 of 23rd August 1878, will show what the result of applying this measure is. It expresses our land revenue in terms of cotton acreage:—

> "The figures showing the value of the crop, which may be implicitly relied on, afford an incontestable proof of the immense importance of the cotton crop to the cultivator. Roughly speaking, less than one-fourth of the cotton crop suffices to pay for the whole land revenue of Berar.

	Quantity.	Value.
1877–78.	Cwt.	Rs.
Exported - - -	1,199,170	2,65,81,602*
Retained for local consumption -	97,523	21,61,760*
		2,87,43,362"

* Calculated at 3 annas and 2 pies per pound.

In making the above extract, my object has not been to show what the pressure of our land revenue is,—to do that accurately an average of several years would have to be taken,—but to point out that we have a measure of its pressure, should the Commission desire to base any inquiry upon it. The field of investigation which such a measure throws open to us seems to me to be capable of being made a very fruitful one. A mere glance at the figures presented above may serve to demonstrate the untrustworthiness of the figures with which Mr. Hyndman startled his readers the other day. And if we might argue that all crops tend to the same money value, and that therefore the value of the crop of the whole cultivated area may be roughly deduced from that of cotton, we should open a wide field of statistical inquiry. I am, of course, aware that such an inquiry would be hazardous, because much of what is produced does not come to market; but in any case there seems to be room for valuable speculation. And I am inclined to think that, owing to the indebtedness of the cultivating classes, the proportion of the total produce of the country that is in fact, though not in appearance, brought into market, and therefore influences market values, is very large indeed. My meaning is, that although much of the produce of the country remains in the cultivator's hands, yet that it remains there after having passed through his banker's books in one shape or another. That, in fact, the bankers get the crops, and re-sell; and that this process has very much the same effect as an actual bringing to market.

The revenue kists cannot be said to bear any fair proportion to the value of the several harvests; for the two kists are equal, whereas the kharif harvest is immeasurably the more important.

The kists are payable as follows: The first on 31st January; the second on the 15th March.

The result is, that the whole demand being in the majority of villages paid from the kharif crop, the cultivator pays half his revenue at a very suitable time, and the other half rather late. Even in villages with a large rabi cultivation the dates are probably sufficiently favourable to the cultivator.

BOMBAY.

BOMBAY.

Colonel Anderson.

The incidence of the land revenue on the cultivated area is given in a table below. The proportion which the assessment bears to the gross produce has been ascertained by a series of careful experiments continued for several years. The printed reports and comments on these experiments are provided for reference. The general result is that the assessment does not amount to one-sixth of the gross produce, and is often no more than one-thirtieth or one-fortieth. Of course it varies much with the season. The universal opinion of the collectors is that the incidence is fair, the rates having been very carefully fixed by the revenue survey as a rent-charge varying with the productive quality of the land. There is no practical difficulty in realizing the land revenue as now assessed, except in years of scarcity. The instalments have been carefully fixed by the Survey Rules (see Nairne's Handbook, p. 121), so that the ryot is called upon to pay immediately after he has harvested and sold his crops. They can be readjusted on the report of the collector, but the unanimous opinion is that they are now judiciously fixed. If an instalment* is not paid within 10 days, a notice is issued for which the defaulter has to pay 4 annas if the amount due does not exceed 5 rupees, and 8 annas if it does.† If payment has to be enforced by law, a fine not exceeding one-fourth of the sum due is leviable, but is generally remitted in years of scarcity. No interest is now charged on instalments overdue.

The following statement shows the incidence of the Government revenue per acre in all districts:—

Collectorate.	Dry Crop.			Garden.			Rice.		
NORTHERN DIVISION.	Rs.	a.	p.	Rs.	a.	p.	Rs.	a.	p.
Ahmedabad - -	1	4	9	5	8	3	4	7	7
Kaira - - -	2	9	1	5	1	2	4	6	11
Panch Máháls - -	1	3	5	2	1	11	2	5	11
Broach - -	4	3	11	6	15	7	5	10	6
Surat - - -	2	10	7	9	8	10	7	13	7

Chap. I. Qn.

Bombay.

Colonel Anderson.

last few years. These experiments have been too few in number, and spread over too short a space of time, to justify any decided general conclusions being arrived at. Besides, the enormous fluctuations in prices of the past four years would upset the conclusions based on the results of any one year. My impression is that we are safe in saying that in fair land in the general run of seasons with ordinary cultivations and average prices, the assessment absorbs less than one-eighth of the gross produce, and in poor land under the same conditions a very much smaller proportion. In many experiments on poor soil the result has shown the assessment to be under 5 per cent. of the gross produce.

There has never been any practical difficulty in realizing the assessment in the Southern Maratta Country as fixed at the first settlement, or as revised since during the past five years, excepting in some parts touched by the famine last year. There some small amount of revenue was remitted and more remained outstanding at the end of the year. No change is necessary in the dates of instalments falling due, which are fixed by Government, and afford ample time for realization of produce before collection. I do not enter further into the question of revenue collection, as the existing orders on this subject will be certainly quoted by the collectors who answer these buestions.

SINDH.

Sindh.

Colonel Ha

The general incidence of land revenue on the cultivated area is about Re. 1-14 per acre.

	Rs.	A.
On rice land - - -	2	12
On wheat land - - -	2	6
On joari and bajri land - -	1	12

The revenue collected may be equivalent to a tenth of the gross produce. The incidence on the various classes of land is fairly distributed. The settlements are all for periods of 10 years only, and they have been introduced at various periods since 1862-63. There has been no practical difficulty in realizing the revenue as now assessed. Instalments of revenue are payable—

For kharif crops.
1st January.
15th February.
1st April.
For rabi crops.
15th May.
15th June.
15th July.

The kharif harvest is well gathered in before any demand is made on account of Government revenue. In the case of the rabi, the necessity of collecting everything within the revenue year unduly hastens instalments which to bear easily on the people should begin about 1st June and end 1st September. Interest on land revenue in arrears is not now charged.

MADRAS.

Madras.

Board o
Revenue.

Incidence of Land Revenue.—A statement is given in the Appendix showing with regard to ryotwari lands—

(1) the area and assessment of cultivable land, including waste;

(2) the area and assessment of land under occupation; and

(3) the area and assessment of land ordinarily cultivated, and the rates of assessment per acre of dry and wet land under each of the above heads.

The subjoined statement shows the rate of assessment per acre of holding, the proportion of wet and dry to total area of holdings, the proportion of waste to culturable area, and the average size of a holding for each district, except Malabar and Canara which have never been surveyed.

N.B.—Second crop charge and water tax have not been taken into account in the "wet" rates shown in column 6. In the Kistna and Godavari Deltas wet land is assessed as if it were dry, and water is charged for at the rate of four rupees an acre.—

Districts.	Population per Square Mile.	Average Size of a Holding.	Average Assessment of a Holding.	Proportion of Dry and Wet Cultivation to Total Cultivation.		Rate of Assessment per Acre of Holding.			Per-centage of Waste.

AP. I. QN. 13.

MADRAS.

Board of Revenue.

Proportion to value of gross produce.—For the portions of the presidency settled by the Settlement Department a statement showing the proportions of the gross and nett produce of lands taken to represent the Government revenue has been furnished by the Director of Revenue Settlement, and is given in the appendix. The principle adopted in the settlement is that the value of the nett produce, after making deductions on account of the vicissitudes of season and the expenses of cultivation, should be equally divided between the ryot and Government. In the earlier settlements, however, viz., those of the Chelambaram Taluq of South Arcot, the Western Delta of Godavari, and the Masulipatam portion of Kistna, the assessment was fixed as nearly as possible at the mean of 30 per cent. of the gross, and two-thirds of the nett value of the produce. Prices having advanced since some of these settlements were completed, the proportions borne by the assessment to the gross produce have diminished. The following statement shows the proportions of assessment to value of gross produce at the commutation rates adopted for the settlement, and at the prices ruling during the last three years preceeding the famine:—

Districts or Portions of the District settled.			Per-centage of Assessments to Value of the Gross Produce at Commutation Rates.	Per-centage of Assessment to Value of the Gross Produce at Ordinary Prices of recent Years.
Cuddapah	Delta – Eastern and Central	Dry.	20	12
	Delta – Western	Dry.	13	8
	Upland	Dry.	12	7
		Wet.	22	14
Kistna	Guntoor Portion	Dry.	15	8
		Wet.	21	13
	Masulipatam Portion	Dry.	18	7
		Wet.	21	12
Nellore	Principal Division	Dry.	18	13
		Wet.	23	17
	Sub-Division	Dry.	18	11
		Wet.	23	17
Cuddapah	Three Taluks, Jammalamadugu	Dry.	15	9
		Wet.	16	11
	Three taluqs, Badvil, &c.	Dry.	14	8
		Wet.	17	11
Kurnool	Proper	Dry.	16	9
		Wet.	16	10
	Pattikonda	Dry.	13	8
		Wet.	17	12
	Cumbum and Markapur	Dry.	13	8
		Wet.	19	13
	Koilkuntla	Dry.	17	12
		Wet.	18	13
Chingleput		Dry.	15	10
		Wet.	20	13
South Arcot, Chelambaram		Dry.	15	8
		Wet.	31	16
Trichinopoly		Dry.	13	6
		Wet.	28	11
Tinnevelly		Dry.	—	-
		Wet.	25	14
Salem	South	Dry.	13	7
		Wet.	21	13
	North	Dry.	12	6
		Wet.	17	10

It must, however, be remembered that the commutation rates represent the price at which the ryots then disposed of, of their grain in their villages, and this was often arrived at by deducting as much as 30 per cent. from the wholesale prices charged by merchants, to allow of a margin for the cost of carriage of grain and the wholesale dealers' profits.

The new settlement rates have been introduced in the districts of Godavari, Kistna, Nellore, Kurnool, Chingleput, Salem, Tinnevelly, and in parts of Cuddapah and South Arcot. They have been sanctioned for Ganjam and Coimbatore, but have not yet been introduced. A succinct account of the principles of the settlement will be found at pages 160–3 of Mr. Maclean's standing information regarding the official administration of the Madras Presidency.

No experiments have been made since the settlements to show the proportions of assessment to produce, with reference to the present outturn, but most of the settlements have been concluded very recently.

Although the proportions shown in the tables above given are only for the average rates of assessment for the whole district, there is no reason to fear that there are many inequalities in individual cases, as one of the special aims of the recent settlements has been the equalization of rates and the removal of anomalies which existed largely under the old settlements.

It is nearly impossible to say what proportion of the value of gross produce represents the Government assessment in most of the districts not yet dealt with by the Settlement Department, numerous changes having, from time to time, been made since the assessment was fixed, and no uniform principle having been adopted at the time of the original settlement. In districts in which there was a rough survey, a fixed share of the gross produce, often exceeding 50 per cent., was taken to represent the Government assessment and commuted into money at rates representing the average selling prices at the time; but the assessments thus fixed having been found to be more heavy than the lands could bear, extensive reductions had to be made, and this was effected not on a fresh calculation of produce and prices, but by a general per-centage of reduction. Detailed information regarding the manner in which the old assessments were fixed in each district will be found in the collectors' replies, but they do not admit of being tabulated here.

Assuming that the rates of produce reported by collectors, with reference to Question 3, represent the average production of the land in each district, the proportion of the average rate of assessment to the value of gross produce may be estimated as follows:—

		Per-centage of assessment to value of gross produce.
Ganjam	Dry	8
	Wet	14
Vizagapatam	Dry	10
	Wet	18
Bellary	Dry	9
	Wet	15
North Arcot	Dry	11
	Wet	11
Tanjore	Dry	8
	Wet	13
Madura	Dry	9
	Wet	9
Coimbatore	Dry	8
	Wet	16
Malabar	Wet	12

The Board do not attach much value to the above estimate as everything depends upon how far the collector's estimate of outturn can be relied on as representing the *average* of the district, but it is given for what it is worth.

Realization of Revenue.—No difficulty has been experienced in the realization of the revenue under the new settlements, nor even under the old ones, since reductions were granted, especially between 1854 and 1858, wherever it was found that the assessments were higher than the land could fairly bear. The high prices which have ruled of late years have enabled the ryots to pay up their dues with ease. The increase in the number of coercive processes in the realization of the Government demand is not due to the pressure of the assessment. The subject will be alluded to in reply to Question 14.

The ryotwar revenue and the Inam quit-rents are paid according to instalments fixed by the Board of Revenue, and shown below:—

Districts.	Proportion of Annual Tax payable each Month.								
	November.	December.	January.	February.	March.	April.	May.	June.	Total.
	AS.	AS.	AS.	AS.	AS.	AS.	AS.	AS.	AS.
Ganjam	–	4	4	4	4	–	–	–	16
Vizagapatam	–	4	4	4	4	–	–	–	16
Godavari	–	4	4	4	4	–	–	–	16
Kistna	–	4	4	4	4	–	–	–	16
Nellore	–	2	2	2	4	4	2	–	16
Cuddapah	–	4	4	4	4	–	–	–	16
Kurnool	2	4	4	4	2	–	–	–	16
Chingleput	–	2	2	4	4	2	2	–	16
Bellary	–	2	2	4	4	2	2	–	16
North Arcot	2	2	4	4	2	2	–	–	16
South Arcot	2	2	2	4	4	2	–	–	16
Tanjore. Kar	3	6	7	–	–	–	–	–	16
Tanjore. Samba	–	–	–	2	3	5	4	2	16
Trichinopoly	–	4	4	4	4	–	–	–	16
Madura	–	2	2	2	2	4	4	–	16
Coimbatore	2	2	4	4	2	2	–	–	16
Nilgiris	2	2	4	4	2	2	–	–	16
Tinnevelly	–	2	2	4	4	4	–	–	16
Salem	2	2	4	4	2	2	–	–	16
South Canara	–	–	4	4	4	2	2	–	16
Malabar	2	2	4	4	2	2	–	–	16

They were fixed as lately as 1876, after a careful consideration of the season, for the principal harvests of each district with a view to enable the ryots to dispose of their produce before paying the Government assessment. No complaints have reached the Board to show that the dates fixed are in any way inconvenient or disadvantageous to the ryots.

The peishcush of zemindaris is paid according to instalments fixed in the original sanads.

Interest charged on land revenue in arrear?—Interest, at the rate of six per cent. per annum, is charged on land revenue arrears under Madras Act II. of 1864.

RAJPUTANA.

JPUTANA.

tain Law.

or Powlett.

Spencer.

Captain Law, Alwar.—The rent-rates on which the assessment was based will be found at page 187 of the *Alwar Gazetteer*. Calculating from these, which will give an approximate, though not a correct, average, it would appear that the mean rate is about Rs. 2-12-9. The rates for irrigated land vary a great deal, but give an average of Rs. 4-0-6; those of unirrigated land one of about Rs. 1-9-7. The land revenue usually equals two-thirds of these rates. Major Powlett says (page 184): "The portion of the net assets fixed as "the State's share was generally two-thirds. But "where three-fourths or more had been paid without "apparent difficulty, three-fourths were determined." The sum paid to the State by the landholder would be two-ninths of the gross produce.

The incidence on the various classes of land is fairly distributed. The assessment was fixed in 1876; but it was collected in some instances at the new rates before this date.

There has been no practical difficulty in realizing the land revenue as now assessed till after the failure of the rains in 1877.

The revenue is paid in two instalments in each season. The dates they become due are—in the autumn, "Mangsir badi ekum," say about the middle of November and a month later; and in the spring, "Baisákh badi ekum," say about the end of April or beginning of May and a month later. They are so arranged as to admit, as far as possible, of the zamindar selling his crops or collecting his rents from his cultivators before his first instalment becomes due. And the several instalments bear a fair proportion to the value of the several harvests from which the revenue or rent has to be made good.

A rate of interest at Rs. 3-2 per cent. is charged on land revenue in arrears.

Major Powlett, Kotah.—Paragraph 13.—I cannot yet give the general incidence of rent on land for the whole Kotah State; but for two parganas which have been surveyed and assessed recently the unirrigated is approximately Rs. 2-10 per acre. The irrigated may be set down as approximately Rs. 10.

The price cultivators get for their crops is so much below the town market rates, that I believe the above to represent about one-third of the gross-produce on both irrigated and unirrigated; but at present I feel little trust in the estimate of the land's productive power. Rent-rates in Kotah are very numerous. Since however they have prevailed for 100 years, it was thought inexpedient to alter them much at the Ryotwari settlement now being made, but only to readjust them. It was found in most villages that some persons did not pay nearly the full rates properly due on their lands, while the most helpless paid more than the full rates. By applying the prevailing rates, about which there could be no doubt, as every cultivator's account is with the State, not with a landlord, reduction was given in nearly a third of the holdings; although the total revenue demand was raised 7 per cent.

There are three revenue instalments in Kotah. The first, of 25 per cent., is due at the beginning of November, a month before the kharif grain can be sold; the second, of 45 per cent., at the beginning of February; and the balance in May. In Boondee, where after each harvest the cultivated land is roughly measured before the demand is made, the rents are taken in a lump sum after the crops are gathered; and there, I am told, arrears are small, while in Kotah they are considerable. Interest is charged on arrears at 12 per cent. per annum; but it is remitted in many cases when the chance of getting it is remote; and it never is allowed to exceed the principal.

Mr. Spencer, Bhartpur.—The average land revenue collected from the cultivated area, which is estimated at bigahs 1,692,892, is Rs. 1-3-9 per bigah, and for the different classes of land it is as follows: For well land Rs. 3 and Rs. 4, irrigated land Rs. 2 and Rs. 2-8, rain land Rs. 1, Rs. 0-14, Rs. 0-12, and Rs. 0-8 per bigah. The total land revenue, which amounts to Rs. 20,16,584-3-0, represents the one-sixth portion of the whole produce of the State. This rental was fixed after much reflection from data prepared during the minority, and can be collected with ease; the inhabitants of a few of the villages who complained that the assessment was a heavy one have been placed under the *khám* system. The whole of the revenue is paid in four instalments, thus—kharif, two instalments, October and November; and rabi, two instalments, April and May.

CENTRAL INDIA.

CENTRAL INDIA.

Col. Osborne.

Colonel W. Osborne, Bhopal.—"The revenue of the following classes of land is:—

1. Kalmat or wheat land,		2½	Rs. per acre.	Dependent on rainfall.
2. Bhamar, jowar bajra land		1½	"	
3. Siar or kodû, tilli land,		1	"	
1st class Chahi, rice, sugar-cane, and opium land		20	"	watered by tanks.
2nd class	do.	10	"	watered by wells.
3rd class	do.	6	"	watered by rivers.

On opium land the cultivators' profits are two-thirds on other lands half. There is no difficulty in collecting the revenue. It is realized in four equal instalments, viz., in October, after cutting makka and rice crops; in December, after reaping jowar crops; in February, after opium and sugar-cane crops; and in April, after wheat and gram crops have been harvested. No interest is charged by the State on land revenue due; the cultivators, when necessary, borrow from bankers, so that there are hardly any arrears."

Lieut.-Col. Bannerman.

Lieutenant-Colonel Bannerman, Baghelkhand.—"The land revenue is very little in excess of the gross rental; if the latter is greater than the former, it is from 7 to 15 per cent., the average being say 10 per cent. The average proportion of revenue to the value of the gross produce, inclusive of cultivators' charges, may be estimated roughly at one-fifth.

The assessment was fixed in 1875 and is still in force; there has been no difficulty in realizing it in ordinary years.

The instalments of revenue are payable *four* times during the year:—

1st.—15th Aghani Soodi—December.
2nd.—15th Magh Soodi—February.
3rd.—15th Chait Soodi—April.
4th.—15th Baisakh Soodi—May,

corresponding to a great extent with the periods of harvest. Each instalment is 4 annas, or one-fourth of the revenue for the year, and on the whole they bear a fair proportion to the value of produce.

In former days from 12 up to 25 per cent. was charged on arrears, at present no such charge is made."

Mir Shahama Ali.

Mir Shahamat Ali, Rutlam.—"The rate of revenue on cultivated land on the average is Rs. 1–12–0, and on cultivated and culturable 14 annas per beegah (2 beegahs=1 acre). The proportion of revenue to the value of gross produce at the prevailing market rates is nearly one-fifth, both of dry and irrigated land. This is a fair adjustment of revenue, considering the proceeds of the cultivators' land. The assessment was re-fixed in 1877–78. No difficulty is apprehended in realizing the revenue as assessed. The revenue is payable by four instalments, on dates noted below.* The first instalment is suited to the proceeds of mukka, the second of jowari, the third of opium, and the fourth of wheat. A period of 15 days is allowed within which each instalment should be fully paid. Beyond it, it is as a rule chargeable with Rs. 2 interest. They bear a fair relation to the ordinary periods of harvests, as well as to their values. The last instalment is made higher to enable an easy recovery of arrears, if due, for the preceding instalments, as well as that instalment itself."

Pundit Suroo Narain.

Pundit Suroop Narain, Manpur.—"The Government rates on cultivated land in Manpur are: for dry land per beegah Rs. 1–2–0, for wet land per beegah Rs. 6–10–0. Some of the Malgoozars in settled villages sublet their holdings on increased rates ranging in the case of dry land to Rs. 2–4–0, and in that of wet land to Rs. 7 or 8. This increase of rates is a mere private arrangement and not recognized by Government, and can last only at the will of the parties. The Bheels pay at the rate of Rs. 3 per plough on dry, and Rs. 4 per beegah on wet land. The rates in Manpur are much lighter than those prevailing within bordering native territory, where the rate on dry land goes up as high as Rs. 3 per beegah, and from Rs. 8 to 20 on wet land. The assessment of the seven settled villages was fixed, as already stated, for 20 years in 1867. The rates being so easy, no difficulty is felt in realizing the revenue, which is paid promptly by the people in ordinary years. Three-fourths of the Government demand is realized in May after the wet crops (including the opium) are harvested, and one-fourth in December after the harvesting of jowari, the chief item of the dry crops; no better arrangement of instalments could be made. Revenue seldom falls in arrears, and whenever it does, in case of poorer Bheels, no interest is charged. Compared to rates in bordering native territory, those in Manpur can admit of increase; but the convenience enjoyed by cultivators in native territory, in the shape of getting suspensions and remissions of revenue and advances for seed and cattle, being wanting here, it would not be advisable for the present to make any change in existing revenue rates in Manpur."

---

* 11th September, 4 annas; 9th December, 4 annas; 8th March, 6 annas; 10th May, 2 annas.

At first sight it appears from the foregoing statement that in the Telingana country the rates of assessment for both wet and dry lands are somewhat high. This, however, is not actually the case. The reason why these rates appear high may be explained by the fact that so recently as 12 years ago the *Batai* (payment-in-kind) system prevailed in the province of Telingana, and hence no efforts were made to get at the correct area of the cultivated lands of each village. So long as Government received a certain share of the produce of the cultivated lands, it did not much matter what the area of that land was. No such accurate survey seems to have been made in the Telingana country in times past as appears to have been made in the Maratha country. It is only since money payments were introduced in Telingana that anything like an attempt to ascertain the area of each field has been made. The result is that the areas thus obtained in a rough hap-hazard way are exceedingly inaccurate, and are not reliable. But as these areas have been recorded by the Patels and Patwadis of the villages, it naturally follows that the error is to the advantage of the ryots. This fact has been ascertained in two ways; *first*, by a rough survey executed through the agency of the Patels and Patwadis; and, *secondly*, by a systematic survey executed by trained officers. The result of the first survey showed an increase of about 50 per cent. over the previously recorded area of wet land, and about 75 per cent. over that of dry land. The results arrived at by the other survey are still more striking, being an increase of 393 per cent. in dry land, and 144 per cent. in wet land, in the nine villages surveyed. The rate of assessment for dry land, which, calculated upon the Patwadis' recorded area, stood at Rs. 3-3-10 per acre, is now reduced to Rs. 0-10-8 per acre. For wet land where it formerly stood at Rs. 27-10-3 per acre, it is now reduced to Rs. 11-4-6 per acre. The following statement, prepared by the Settlement Officer of the Maydak district for the nine villages mentioned as having been surveyed under his superintendence, affords detailed information with respect to this difference:—

	Name of Village.	Dry Cultivation.								Wet Cultivation.							
		Area in Acres.				Increase in Area.		Per-centage Increase in Area.		Area in Acres.				Increase in Area.		Per-centage increase in Area.

CHAP. I. QN. 18.

HYDERABAD.

Moulvie Mahdi Ali.

Maulavi Shekh Ahmad Husen, Talukdar of the suburban district, bears testimony to the difference between the correct area and that entered in the Patwadis' papers, by bringing forward a statement prepared from the survey records about the Patlur Taluka, showing the results obtained by survey, an abstract of which is given below :—

No.	Name of Village.	Old.	Present.
		Bighas.	Bighas.
1	Rikupal - -	210	757
2	Inor - - -	259	506
3	Yechuram - -	193	573
4	Balkal - - -	133	890
5	Turmal - - -	168	391
6	Madhuram - -	55	129
	Total - -	1,018	3,246

In the taluka of Tekmal about fourteen villages have been surveyed, and the result obtained has been a considerable excess of the cultivated area over that recorded. In wet land that area exceeded by 263 per cent., and in dry about 163 per cent. Mr. Swami Rao, Sadr Talukdar, had about fifteen villages of the Kalwakarti taluka, in the Nagar-Karnul district, measured, and the result was that the actual area exceeded that recorded by 41·3 per cent.

In Mouza Chinthalpilli, taluka Kullubgur, the irrigated land, as shown in the Kulkarni's papers, was only 39 acres, while by the survey it was ascertained to be 66 acres, being an excess of 67·64 per cent. In this same village the lands under dry crops according to the Kulkarni's returns were 216 acres, whereas they have been ascertained by the survey to be 402 acres, showing an excess of 85·56 per cent.

Taking the whole Telingana province, the discrepancy in the area of cultivated lands may not perhaps be so considerable as that which is apparent in the Medak district. This much, however, may be safely stated, that, taking the Telingana country as a whole, the excess under the head of wet lands will probably amount to about 30 per cent. over the recorded area, and the dry lands to about 50 per cent. Calculating on these data, it may be assumed that the average rate of assessment for wet lands is Rs. 9–13–0 per acre, and of dry land Rs. 0–15–4. Under Mogul and Maratha rule, the Maratwadi country was frequently surveyed, and therefore no very great discrepancies exist between the true and the recorded area of each village. The excess in this case may be safely put down at about 15 to 20 per cent. of the recorded area.

It is difficult to state with any degree of accuracy the proportion which such revenue bears to the value of the gross produce, as to do this we must first ascertain the exact gross produce of the land. Now, nothing can be more difficult than to ascertain accurately the gross produce of the different descriptions of soil throughout the country; and, even supposing that this was done one year, the outturn of the next season may upset all our calculations, and render a fresh beginning necessary. The influences at work are so various, and so little to be depended upon for uniformity of operation; the character of the season, the degree of labour spent on the soil, and other contingencies affecting the out-turn of cultivation are so numerous and variable, as to make it exceedingly difficult to arrive at an estimate sufficiently correct to answer our purpose on all occasions. It must be remembered also that economical conditions are constantly changing; that the market value of produce varies from year to year; and that therefore it would be difficult, under any circumstances, to lay down what proportion the revenue bears to the value of the gross produce. I had some experiments conducted, however, under my own supervision, in 1285 Fasli (1875), and some by the district officers in 1286 Fasli, in order to ascertain the out-turn per bigha of the different varieties of crops. Some of the talukdars have also examined experienced cultivators on the subject.

Subjoined is a rough estimate, based on the returns of produce submitted by the talukdars, which will afford an idea of the proportion that the average assessment bears to the produce of all the districts :—

District.	Value of total Food Produce in British Rupees.	Value of other Crops in British Rupees.	Total value of Produce in British Rupees,	Revenue, inclusive of Cesses in British Rupees.	Proportion of Revenue to value of Produce.

Gulbarga - - -	26,57,701	7,91,122	34,48,823	7,65,949	4·5
Shorapur - - - -	41,66,399	19,41,054	61,07,454	6,91,290	8·69
Raichur - - - -	36,13,079	18,40,997	54,54,076	7,92,201	6·88
Lingsugur - - -	45,35,044	18,21,437	63,56,481	7,57,394	8·12
Total -	6,08,33,726	2,18,22,690	8,26,56,416	87,70,097	9·42
GRAND TOTAL -	9,34,86,524	2,95,39,412	12,30,25,936	1,59,60,345	7·71

From this statement, as well as from the results arrived at by personal experiments, it is apparent that the proportion the rate of assessment bears to the produce is higher in the case of wet cultivation than in that of dry. The reason for this is to be found in the fact that the rates of assessment in the former case include both the land tax and water cess, and that the yield from irrigated land is considerably in excess of that from dry-crop lands. If one might hazard a conjecture, I would venture to state that, in

HAP.I.QN.13.

HYDERABAD.

Moulvie Mahdi Ali.

my opinion, founded on personal experiments and on inquiry, the proportion that the average assessment bears to the average produce in the dry-crop cultivation of the Maratha country, in ordinary years, may be set down at about $\frac{1}{9}$, and in the Telingana districts, where wet cultivation is chiefly resorted to, at about $\frac{1}{5}$.

In the Maratha districts the revenue instalments are made payable at the following dates:—

		Rs.		
15 Azur=26th October	- -	0	4	0
15 Bahman=23rd December	-	0	8	0
15 Farvardi=21st February	-	0	4	0

The first instalment covers the kharif crop, the second covers the kharif and rabi, and the third the rabi. Some changes will have to be made in the periods fixed for the realization of the revenues by and by. In the talukas which have come under settlement the revenues are realized as follows:—

The first instalment on or about the 15th of Dai, corresponding with the 24th of November, when the kharif crop is harvested.

The second instalment on or about the 15th of Farvardi, corresponding with the 21st of February, when the rabi crop is harvested.

In villages where no rabi or later crops are grown, the tehsildars are directed to recover the full amount of the revenue due in a lump sum and at once, when the kharif is harvested. But in villages where both kharif and rabi crops are grown, the realizations are made by equal instalments on the dates last mentioned.

In the Telingana districts the revenue instalments are made payable at the following dates:—

		Rs.		
15 Azur=26th October	- -	0	3	0
15 Dai=24th November	- -	0	3	0
15 Ardibehest=24th March	-	0	4	0
15 Amardad=26th June	- -	0	6	0

The first instalment covers the kharif harvest. (The jowar crop is not harvested at this time of the year, but all other crops are.) The second covers the abi harvest; the third the rabi harvest; and the fourth the rabi.

HAP.I.QN.14.

CHAPTER I.—QUESTION 14.

What is the average price of land per acre? What amount of land on an average is sold every year for arrears of revenue and for decrees of court? What quantity of land has been transferred in your district to non-agricultural and non-resident landlords.

PUNJAB.

Major Wace.

PUNJAB.

In the Punjab, in order to keep up to date the record of rights prepared at settlement, every mutation of rights is reported by the patwári (village accountant) of the village in which it occurs to the district revenue authorities, and after a summary inquiry as to the truth of the report, the result is recorded in a brief proceeding, which is filed in the district office with the records, and the village accountant is directed to make a corresponding alteration in the rent roll (jamábandi) of the year. This system has been in force in the Punjab for 20 years past, and the statistics of each year are incorporated for the whole province in statements appended to the annual revenue report.

Accordingly, with a view to furnishing a reply to this question, I have compiled and append the returns of the eight years commencing 1869–70 and ending 1876–77. The form of the annual returns was changed from 1874–75; and in that year the total mortgages then existing were also ascertained. These returns contained—

A.—Statement of transfers (sales and mortgages) during the five years 1869–70 to 1873–74.

B. Statement of sales for the three years 1874–75 to 1876–77.

C. Statement of mortgages and redemptions of mortgage for the same three years.

D. A statement in which the total mortgages existing on 31st March 1874 are compared with those existing on 31st March 1877.

The most important conclusions to be drawn from these statements may be briefly summarised thus:—

Reference to statements appended.	Transactions.	Total number of Contracts.	Total average thereof.	Consideration paid.			Per-centage which the yearly revenue of the Lands transferred bears to the total Revenue of the Province.	
				Total Rs.	Average amount per acre.	How many times the amount of the annual Revenue of the Lands transferred.	For the whole period.	For one year.
A.	Sales of the 5 years ending 1873–74 Average per annum -	25,970 5,194	433,133 86,628	60,90,490 12,18,098	14	22	1·22	0·24
B.	Sales of the 3 years ending 1876–77 Average per annum -	20,498 6,833	270,348 90,116	51,04,608 17,01,536	19	27	0·84	0·28
	Mortgages of the 5 years ending 1873–74 - - - - - Average per annum -	68,235 13,647	839,572 167,914	1,14,26,998 22,85,399	14	16	3·30	0·66
C.	Mortgages of the 3 years ending 1876–77 - - - - - Average per annum -	53,593 17,864	592,881 197,627	95,20,324 31,73,441	16	19	2	0·66
C.	Redemptions from mortgages during the same period - - Average per annum -	9,548 3,183	149,198 49,733	11,73,626 3,91,209	8	11	0·5	0·16
D.	Total mortgages outstanding in the Punjab on 31st March 1874 -	139,902	13,14,146	1,87,06,396	14	15	—	6
D.	The same on 31st March 1877 -	183,974	17,57,829	2,70,53,094	15	17	—	7

Nearly the whole of the land which is the subject of these transfers is cultivated land; very little waste is included.

The conclusion indicated is, that taking the province as a whole, neither sales nor mortgages occur in such numbers as to give ground for anxiety concerning the general prosperity of the agricultural classes. I believe the returns to be fairly complete and reliable; but even were a wide margin allowed for short registration, the same conclusion concerning the general prosperity of the agricultural classes would hold. The most incomplete portion of the returns is probably that of the total mortgages outstanding on 31st March 1874 and 1877.

According to these returns the total lands encumbered with mortgages amount to only 7 per cent.* of the province, and the average annual sales and mortgages together amount to only 1 per cent.

There is also the strongest evidence of a steady rise in the value of land; evidence which is confirmed by the common opinion of the revenue officers of the province, and by many of the records of our administration. For instance, in the Administration Reports of the years 1861–62 and 1862–63 † it was noticed with satisfaction that the value of land was steadily rising, the sale value then standing at so high an average as 7 years' purchase of the Government demand; the mortgage value was also said to average 8¼ years' purchase. In the same years the aggregate price of the sales reported was about 2¼ lakhs, and of the mortgages 3¾ lakhs. Compare these figures with the results shown in the table above given. The sums paid for sales have averaged during the past three years 17 lakhs, and for mortgages 39 lakhs; while prices averaged 27 years' purchase of the Government demand for sales, and 19 years' purchase for mortgages. Say, if you will, and no doubt with much truth, that the registration of transfers is now much more perfect than before, nevertheless the average values are probably not far from the truth; and even after doubling or trebling the aggregate reported transfers of 1861–62 and 1862–63, the proof of the rise in the value of the land, and of the increasing confidence with which all classes regard it as a source of profit, will hardly be materially affected.

Between the value of irrigated and unirrigated land, and also between that of land which owing to its situation near a town or village site is usually constantly manured and land not so advantaged, there is of course the widest difference. It is to be regretted that the annual returns make no attempt to show such differences, and within the limits of this reply I can only make a general statement on the subject. Unirrigated land, usually manured and well advantaged by vicinity to a village site in the submontane districts of the Punjab, would rarely sell for less than Rs. 50 an acre; and not unfrequently reaches nearly double that value. Irrigated land is commonly sold for twice the price of unirrigated land of similar quality. And if the irrigated land is well manured, and such as usually bears the richer crops (sugar-cane, turmeric, tobacco, and vegetables, and such like), Rs. 200 per acre is not an unusual price. If the returns had been in such detail as to enable us to distinguish between irrigated and unirrigated land, it would have been very apparent how steadily the price of unirrigated land varies directly according to the rainfall and irrigation. This the returns indicate even as they stand; for example, the following table shows the average price of land in each district; the districts being arranged in the order of their rainfall:—

District.	Rainfall of head-quarters.	Per cent. of Cultivation irrigated.	Average price of Land per acre, 1874–75 to 1876–77.

The sale of land for arrears of revenue in the Punjab is, and has been for many years past, unknown. Its sale to satisfy decrees of court is extremely rare.

On the latter point, the rule in the Punjab, a rule which originated with the old non-regulation law, and was continued under the discretionary power vested in the Government by section 327 of the present Civil Procedure Code (as well as by the corresponding provisions of the Code of 1859, which it superseded), has always been* that "no land or interest in land "shall be sold without the previous sanction of the "Commissioner of the division (Civil and Sessions "Judge), and in the case of hereditary or joint-"acquired property in land without the previous "sanction of the Chief Court." Such sanction is not given as a matter of course, but only on a consideration of the conduct of both parties, and of the whole circumstances of the decree which it is desired to enforce by this extreme process.

The Registrar of the Chief Court is unable to furnish statistics of land thus sold each year; but it is known to be of insignificant extent.

The statistics available show only the total sales of immoveable property of all kinds, and these average 1,724 per annum for the three years ending 1876. Nearly all of these are cases of sale of houses and building sites in villages and towns. Of 1,661 such cases which occurred in 1876, in only 169 was ancestral or jointly acquired property sold. The returns for the same years show that the number of cases in which temporary alienations of land† were sanctioned by civil courts for the satisfaction of decrees averaged 502 per annum.

On this point no statistics are available. It may be replied generally that transfers to non-resident landlords rarely occur; that is to say, the purchasers of land, whether agriculturists or capitalists, are almost invariably residents of the village in which the purchased land lies, or of its immediate vicinity. The total amount of land transferred to non-agriculturists since annexation could not be stated, except after inquiries in each district, the expedience of which would be more than doubtful. The annual returns of sales and mortgages (summarised in the statements appended) have, since 1874, distinguished the transfers to agriculturists from those to non-agriculturists; and it seems better to be content with the statistics thus available than to institute extensive inquiries concerning the transactions of years previous to 1874. The statements appended show that, in the three years ending 1876-77, the proportions of transfers in which the transferrees were respectively, agriculturists and non-agriculturists stood as follows :—

---

* Estimated, not on the acreage, but on the land revenue demand, which is a truer valuation for such a calculation as this than the acreage would be.

† Paras. 201 and 298 respectively.

* Punjab Government notification, No. 3,859, dated 3rd October 1877. Previous thereto the prohibition extended to all immoveable property, *i.e.*, to houses as well as land. But the terms of section 327 of the present Code limit this prohibitory action to land and interests therein.

† Sections 305 and 326 Civil Procedure Code.

		No. of transactions.	Acres transferred.	Total consideration paid.
Voluntary sales under pressure of debt	To agriculturists - -	10,996	127,320	26,25,106
	To non-agriculturists -	6,563	80,186	17,87,611
Other sales - -	To agriculturists - -	2,113	36,586	4,23,873

	To non-agriculturists -	26,032	363,711	53,25,241
	Total -	53,593	592,881	95,20,324

Some remarks on the subject will be found in the appended extracts from Revenue Reports. It probably not unfrequently happens that a transferree whose main livelihood is derived from money-lending or petty agricultural banking, the class of man locally described as the banea or village trader, gets himself returned as an agriculturist on the strength of a previously acquired ownership of some other land. But even after allowing for this source of error, it is evident that of 51 lakhs of rupees expended on the purchase of lands in these three years, at least half were spent by agriculturists, and of 95 lakhs laid out in land mortgages a third were supplied by the same class. Though such facts may not by themselves establish the existence of prosperity among the agricultural class at large, they at least prove that the British administration in the Punjab has succeeded very generally in so adjusting its revenue demand on the soil as to leave to the agriculturist substantial profits; profits for the possession of which both the old agriculturists and those other classes who for generations before our rule thought only of trade and money-lending are actively competing. And, be it remembered, that this is taking place in a country where within the last 30 years agriculture was followed rather as a calling, to which certain castes and classes were then born, than as a profitable occupation; and where a land revenue pitched so high as to make its payment a burden and to absorb all the profits of agriculture had been the normal feature of previous centuries of native rule.

At the same time, lest it should be thought that the above review of the subject is one-sided, I append two papers which give a fair summary of the conflict of opinions on the subject which lately occurred in the Punjab; the one, dated 1st April 1874, by Mr. Justice Melvill; the other the proceedings of the Honourable the Lieutenant-Governor of the Punjab (Sir Henry Davies), No. 4609, dated 23rd December 1874. And it may be fairly argued that the question is not to be decided by per-centages and averages reckoned for a whole province. We here and there find tribes and tracts where the indebtedness and mortgaging is undoubtedly of a very serious character. Some tribes, as the Saiads and the Muhammadan cultivators in the east of the province, seem to be invariably thriftless and slothful, others have been accustomed for centuries to spend their energies in *quasi*-military service and in local rivalries and feuds; the field for all, which, except the first in a very limited degree, our peaceful rule has swept away, and such men are ill adapted by traditional habits for steady agricultural industry, a quality which their forefathers regarded as the mark of men much beneath them in social status.

From Registrar, Chief Court, No. 1643, dated 2nd July 1874, forwarding Notes by Mr. Justice Boulnois and Mr. Justice Thornton.

Annual Report of the Revenue Administration of the Punjab for 1873-74, paragraphs 149 to 150 inclusive.

Remarks.—The question discussed in the above correspondence is one which has of late attracted considerable public attention, not only in the Punjab, but in other parts of India, and may be briefly stated as follows :—

Is further legislative action required to protect the peasant population from the usurer and save their lands from alienation by sale or mortgage to the money-lending class?

2. So far as the Punjab Government is concerned, the subject is not a new one. The impolicy of leaving the peasantry to the mercy of the usurer, and of permitting too rapid or wholesale dispossession from their hereditary lands of old proprietary tribes, has from the first been recognised, and has largely influenced both its revenue and judicial administration.

3. With regard to revenue administration, light assessments and prompt remission or suspension of demand in unfavourable seasons have been freely granted and it is satisfactory to observe that the indebtedness of the agriculturist, which is said to call for legislative interference, is attributed, not to the undue pressure of the land revenue, but to the extravagance resulting from high credit and the increasing value of land.

4. In the Judicial Department a wide discretion has long been exercised by the civil courts in reducing extortionate claims for interest by money-lenders against agriculturists, and attention has been of late specially called to the subject by the learned Judges of the Chief Court in a circular which will be found amongst the annexures of these proceedings; and under instructions issued by them agricultural implements, including plough-bullocks, gear of wells, houses, and sheds, are exempted from attachment in execution of decrees for debt.

Again, under section 244 of Act VIII. of 1859, temporary alienation of revenue-paying land may be substituted by order of court for sale of such land in execution of decrees for debt under the provisoes with which that Act was extended to the Punjab; no ancestral or joint-acquired property in land can be sold in execution save with the sanction of the Chief Court, which is rarely accorded; and under the law

CHAP. I. Qn.

PUNJAB.

Punjab. Governmen Proceeding

of pre-emption, contained in sections 9 to 14 of the Punjab Laws Act of 1872, every voluntary sale of land within a village boundary is voidable, unless it is first offered to the co-sharers of the village, and, in the event of their declining, to the other members of the village community. It is further to be noted that under the general law of India all written instruments of transfer of immovable property of more than Rs. 100 in value are invalid unless publicly registered; that in regard to mortgages no foreclosure can take place except under orders of court, and in these cases also, in the case of the Punjab, the law of pre-emption applies; and lastly, that the wide definition of "undue influence" contained in section 16 of the Indian Contract Act of 1872 gives the courts the most ample power to prevent the enforcement of agreements which are not absolutely voluntary.

5. It is now to be considered whether any additional safeguards and restrictions are required to protect the agriculturist from ruin.

The necessity for further legislative action was first advocated by Mr. Justice Melvill in 1872, and on his suggestion inquiries were instituted by the Chief Court, with the sanction of the Lieutenant-Governor, in every district in the province; subsequently, in his review of the land revenue administration of 1872–73, the Lieutenant-Governor drew the attention of the Financial Commissioner to the subject, and that officer made it the subject of special inquiry during the past official year. The result of the inquiries thus independently conducted is contained in the correspondence above referred to, copy of which is appended to these proceedings; and it will be perceived that the conclusions arrived at by the superior officers of the province are widely different.

6. Mr. Justice Melvill, to whom the Lieutenant-Governor is much indebted for the attention he has devoted to this important subject, retains the opinion that, notwithstanding the restrictive laws in force, there are still grounds for believing that, owing to the usurious rates of interest charged by the money-lending class, the agriculturists are becoming deeply involved, and are being driven by pressure of creditors to transfer their lands by sale or usufructuary mortgage into the hands of strangers. He considers, therefore, that legislative action is called for, and recommends—

(1.) That courts should be enjoined to "look " behind the terms of a bond so as to unravel the " real nature of the transaction and ascertain the " principal amount with a view to the adjudication " of such a sum by way of interest as might seem " equitable in cases where, owing to the absence of " free consent, the elements of a perfectly enforce- " able contract were wanting;"

(2.) That the term of limitation for claims on account should be extended from 3 to 6 years;

(3.) That further restrictions should be placed on the voluntary sale or mortgage of lands by providing—

  (*a*.) That no transfer of land shall be permitted in payment of debt to a creditor; and,

  (*b*.) That no mortgage shall be valid for more than the lifetime of the mortgagor without the sanction of official authority;

(4.) That so much of the produce of land as represents the cost of cultivation should be exempted from attachment; and

(5.) Lastly, that imprisonment for debt should be abolished.

7. Mr. Justice Boulnois expresses inability to write at length on the very difficult and important questions raised, but gives an opinion in favour of an extension of the law of limitation and the prohibition of sales of land in execution of decrees held by mahájans for debts, and also of the abolition of imprisonment for debt.

8. Mr. Justice Lindsay, on the other hand, altogether doubts the necessity for legislative action, and Mr. Egerton, the Financial Commissioner, after reviewing the statistics of transfers of land for the past five years, is of opinion that there is nothing alarming in the extent to which land is being transferred, but that, on the contrary, a natural and healthy process is going on, which should on no account be interfered with.

9. Such being the conflict of opinion amongst the superior officers of the province as to the necessity for legislation, it appears desirable, before discussing the suitability of all or any of the measures proposed by Mr. Justice Melvill, to scrutinise carefully the grounds on which their necessity is asserted, to consider whether the extent of the evil is really such as to call for legislative interference,—in other words, whether there is any sufficient evidence that the agriculturists are to an alarming extent indebted to the money-lender, or that the transfer of lands is being affected to a serious extent to the money-lending class.

10. From a reference to Mr. Justice Melvill's final minute, and the voluminous reports upon the subject which have been obtained from the office of the Chief Court, it would appear that those who believe this to be the case found their opinions not so much upon a comprehensive survey of facts as upon their own experience and impressions, or the opinions and impressions of others. Such opinions and impressions are indeed most valuable, but it is to be remembered that they proceed for the most part from judicial officers engaged perhaps day after day in presiding as judges of civil courts in rural tracts where suits against agriculturists form, as might be expected, the staple of litigation; it is easy to understand that officers so occupied should take a gloomy view of the financial position of the peasantry: but opinions thus formed, being necessarily the result of limited observation, cannot be accepted as conclusive. Moreover, even judicial officers are by no means unanimous on the subject. The difference of opinion among the learned Judges of the Chief Court has already been adverted to; but, besides Mr. Justice Lindsay, Lieutenant-Colonel McMahon, the able Commissioner of the Hissar division, Mr. Gore Ouseley, the Commissioner of Umballa, whose long and varied experience in this and other provinces gives great weight to his opinion, the late Mr. Blyth, whose acquaintance with the feelings and wants of the people was perhaps unsurpassed, have recorded their opinions that no case is made out for further legislative interference. This view appears further to be in accordance with popular opinion, so far as that opinion has been ascertained; for it is stated that Lieutenant-Colonel Mercer, the Deputy Commissioner of the Jullundur district (one of the districts especially mentioned by Mr. Justice Melvill as requiring relief) convened a public meeting comprising representatives of all the classes most interested in the question, namely, Zamíndárs who were in debt, and had transferred their lands to meet the demands of their creditors, Zamíndárs who were free from obligation, and money-lenders who held the lands of their constituents by right of sale or mortgage, and money-lenders who had no such interest in the land. The question having been put whether any alteration in the present law was desirable, it was found to be the unanimous opinion that no further restriction should be placed upon the sale or transfer of land than that which would prevent fraud or undue advantage being taken; that any legal prohibition against usurious rates of interest would affect both lender and borrower injuriously, and diminish the market value of land, and that no alteration in the law of limitation was called for.

11. The Lieutenant-Governor's sympathies are entirely with those who would use all reasonable means to protect the agriculturist from extortion, and he is not disposed to attach too much weight to the opinions expressed adverse to legislative interference.

Nevertheless, it appears to his Honour that, before a sound judgment can be formed upon this important question, a far wider survey of the facts is necessary

P. I. Qn. 14.

UNJAB.

Punjab.
overnment
occedings.

than that which has been taken by the advocates of special legislation.

Too sweeping conclusions must not be drawn from individual cases; the number of the indebted must be viewed in relation to the number that are prosperous, and the amount of land transferred with reference to the amount transferable. His Honour will endeavour to view the matter from this stand-point.

12. Looking, then, in the first place at the statistics of civil justice, it appears that while the total number of agriculturists in the province is upwards of 10,000,000, the total number of suits for debt brought against this class does not exceed 80,000 in the year, so that in one year one agriculturist out of 125 is annually sued for debt; but a reference to the Blue-Book of Judicial Statistics annually laid before Parliament will show that in England and Wales about one person in 22 is annually sued for debt in the county courts alone, and this notwithstanding the fact that the period of limitation for suits on account is twice as long as in this province.

So far, then, as freedom from debt suits is a test of solvency, the agriculturists of the Punjab must be considered far better off than the inhabitants of England.

13. But again—Is there any valid ground for supposing that the agriculturist is being driven by pressure of debt to transfer his lands to others to any serious extent?

The Financial Commissioner has during the year furnished statistics which afford an answer to this question. From these statistics it appears that during the last five years—

(1.) Sales of land for debt in execution of decrees of court were almost unknown; only one sale of ancestral land was sanctioned in 1873;

(2.) That the number of voluntary sales of land averaged less than 6,000 per annum, so that, as the proprietors of land, according to the Financial Commissioner's returns, number 2,006,670, only one proprietor out of 334 parts with land in the year;

(3.) That the number of mortgages averages less than 15,000 in the year, being at the rate of one mortgage to 133 proprietors.

(4.) That the aggregate area of assessed land annually transferred by private sale amounted on an average to less than one acre per square mile; that during the past year there were only six districts in which more than one acre per square mile was transferred, and in only a single district more than two acres per square mile;

(5.) That, on an average, not more than two acres per square mile were annually mortgaged, that last year in only seven districts did the number of acres exceed three per square mile, and of these districts five are among the most prosperous and wealthy in the province;

(6.) That the value of land is steadily rising in the market, and last year averaged 28½ years' purchase of the Government assessment.

14. Assuming, then as the most unfavourable view of the case possible, that all these transfers of land are made to money-lenders, and in consequence of pressure of debt, it will be seen that the number and extent of such transfers are insignificant, and the only fair deduction to be made from the statistics is that the proportion of extravagance which prosperity and credit naturally produce is, in the Punjab, most creditably small.

But in point of fact there appears no valid reason for supposing that *all* these transfers, whether by sale or usufructuary mortgage, are made to the money-lending class, or are in consequence of pressure of debts. Some of the sales are doubtless the result of the high prices offered, and many of the mortgages for the purpose of raising capital for agricultural improvements, while the law of pre-emption places a most effective check on the acquirement of village lands by other than members of the proprietary body; and it is shown by statistics collected in one district of the province that the bulk of the transfers of landed property are made, *not* to village bankers, but to brother agriculturists. So far then as statistics are concerned, it would appear that the apprehensions which have led to a call for legislative interference are at present without adequate foundation.

15. But his Honour does not base his opinion on statistics alone; in the course of his annual tours he has visited every district of the province, and the result of his inquiries corroborates the above conclusion; he has found that, though there may be individual cases of embarrassment due in most cases to personal extravagance, the state of the peasantry is in general eminently prosperous; and he concurs with the Financial Commissioner (who is also well acquainted with every part of the Punjab) in the opinion that the transfers which are taking place do not exceed, or indeed nearly equal, the number which may safely accompany the natural and healthy development of wealth in a country in backward circumstances.

16. There is, the Lieutenant-Governor thinks, great reason to fear that to increase the restrictions on the sale or transfer of land in the manner proposed, or to further interfere with the freedom of contract between the money-lender and the agriculturist, would operate simply to depreciate the value of land as a security, and raise still higher the rate of interest, and, while the measure would fail to teach prudence to the improvident, it would tend to destroy the habit of self-reliance and industry which characterises many of the cultivating races of the Punjab, and is one great cause of its agricultural prosperity. Finally, to extend the period of limitation in debt suits would, his Honour apprehends, only stave off and ultimately intensify the evil it is sought to remedy.

17. Fully sensible of the dangers attending the indiscriminate application of the received doctrines of political economy to unforeseen circumstances, his Honour is, as were his predecessors, prepared to sacrifice, if necessary, a large amount of theory to secure contentment among the people; but it is a matter of congratulation that in the present state of the province no such exceptional action is called for. All that appears necessary is that the civil courts should bear carefully in mind the instructions contained in the Chief Court's Circular, No. 3 of 1873, on the subject of awarding interest. Should cases of individual embarrassment largely increase in any district, it may be perhaps necessary to extend the provisions of the insolvency sections of the Punjab Laws Act to the locality, or to recommend the extension to this province of section 154 of the Land Revenue Act of the North-Western Provinces, enabling the district officer to assume the management of the lands of a disqualified proprietor; but even these measures appear hardly called for under present circumstances. Meanwhile, the subject will continue to receive his Honour's careful attention, and endeavour will be made to obtain more complete statistics on the subject.

18. One other subject touched upon in this correspondence requires notice,—the proposal to abolish imprisonment for debt. This subject is one which must be considered from a wider point of view than its effects upon the peasantry, in whose case, as pointed out by Mr. Justice Melvill, it is rarely resorted to.

But, looking at the statistics of civil justice, it appears that in the year 1873, though the number of applications for execution disposed of was 110,384, in only 6,107 cases were judgment-debtors arrested; that out of these it was only found necessary to detain 708, and that of those detained the great majority were released before the expiration of three months. It is further to be observed that any judgment-debtor who satisfies the court that he has no assets, and has not committed fraud, is at once released, and that information as to the law on the subject is hung up in every civil debtor's ward. Now, having regard to

CHAP. I. QN. 1.

PUNJAB.

Punjab. Government Proceedings.

the fact that the sale of land in execution of decrees is, in the Punjab, practically prohibited, that execution against other property is constantly evaded by concealment of assets or vexatious claims to property attached, and, lastly, the fact that the existing rate of interest charged is said to be exorbitantly high, his Honour is doubtful of the expediency of reducing the security of a creditor still further, and raising his rate of interest by depriving him of a means of compulsion which is found to be eminently effective, is not shown to be abused, and is so fenced with precautions as to be almost incapable of being made an engine of oppression.

Mr. Melvill.

Minute by Mr. Justice P. S. MELVILL, Officiating Judge, Chief Court, Punjab,—dated Lahore, 1st April 1874.

Replies having now been received to the questions suggested in my memorandum of the 11th June 1872, the substance of those replies is here noted :—

1st question.—" Whether the existing law in regard " to interest causes undue hardship to debtors; and if " so, to debtors of what class ? "

The almost unanimous reply is in the affirmative, and the class indicated is the agricultural class.

The general reasons assigned for the affirmative reply are the necessities of the revenue-paying classes, their extravagance and ignorance, and helplessness when once they have fallen into the hands of the money-lenders.

To the *2nd question,—viz.*, " Whether, owing to " decrees for excessive interest, revenue-paying land has " been sold by order of court in execution during the " last five years,"—the answer is generally in the negative. There are a few instances in which land is said to have been sold in the manner and for the cause indicated in the question; but these instances are so rare, and the amount of land sold is so small, that they do not affect the general conclusion.

The *3rd and 4th questions* are—" The extent to " which private alienations of revenue-paying land " have been made during the past five years in satis- " faction of the debts other than decrees of court," and " whether such private alienations are attributable to " the apprehended action of the courts in decreeing " excessive interest."

The answers to these questions are very indefinite. For some districts the number of cases of transfer is given without specification of the area, and for some districts the return has been given only instead of five; so that it is impossible to specify the extent to which alienations have been made. The present inquiry has not, therefore, resulted in the obtaining of reliable statistics. The causes of the alienations are not stated with any degree of certainty, but most of the replies point to the action of our courts in decreeing excessive interest, and to the heavy costs involved in suits. It is clear, however, that very extensive alienations have occurred in different parts of the Punjab during the five years preceding 1872, and that they are chiefly owing to indebtedness and the extreme difficulty of escaping from it by any other method. Some of the most prominent instances are here noted :—

District.	Alienations during last 5 years.	Cause assigned by Local Officers.
Ferozepore -	About $\frac{1}{12}$th part of the revenue-paying land.	Not the apprehended action of the courts, the alienations being made out of court after decree.
Gurdàspur -	Sales 464 cases; mortgages 2,612 cases.	Heavy expenses of law suits.
Jhang - -	37,565 acres - -	Pressure of debts and action of courts.
Peshàwar -	12,000 acres - -	Interest and costs.
Mooltan -	74,697 acres - -	Action of courts in decreeing excessive interest.
Jhelum - -	2,104 cases - -	To avoid annoyance, expense, and indignity of suits.
Kàngra -	6,553 acres sold; 34,251 acres mortgaged.	Action of the courts in decreeing excessive interest.
Rawalpindi -	27,485 acres - -	Do. Do.
Jullundur -	46,850 acres sold; 31,895 acres mortgaged.	Not the apprehended action of the courts.
Gujránwàla -	20,788 ghumáos sold; 24,760 ghumáos mortgaged.	Interest low. (The ghumáo may be roundly stated as being equivalent to an acre).
Hoshiàrpur -	6,909 acres sold; 85,290 acres mortgaged.	About 12 per cent., the total málguzár (revenue-paying) area of the district. Not the apprehended action of the courts.

The *5th question* is—" What was the custom during " Sikh rule in regard to interest ? "

No general custom applicable to all parts of the Punjab is shown to have existed, but the replies show that a very common custom in most parts of the country was that not more than 50 per cent. on the principal in cash loans, and 100 per cent. in loans of produce, was demandable by way of interest.

The *6th question* is—" Whether any, and what, alteration is desirable in the present law of interest ? "

A large majority of officers recommend an alteration in the present law, their opinions generally tending to the fixation of a maximum rate of interest that may be decreed by courts, more particularly in cases where the debtors are agriculturists, and to giving the courts the power of making an equitable adjudication of interest, notwithstanding any agreement made by the parties. Some of the most thoughtful reports, however, are against any alteration in the existing law.

2. These reports and statistics of civil litigation prove that the agricultural population of the greater part of the Punjab is very extensively indebted to the money-lenders. The class of money-lenders has increased largely during British rule; and, in addition to the petty banker, who borrows his capital from the old-established bankers, we have the landowners not uncommonly taking the lending money on the same terms and with the like avidity as the professional lender.

3. The cause of this indebtedness is to be found—1stly, in the extravagance of the borrowers; 2ndly, in the rapacity and unscrupulousness of the lenders, more especially those whose profession it is to lend.

The extravagance of the agriculturists is evinced in marriage and other social rites, and in a comparatively reckless way of living. They found themselves a few years after the introduction of British rule in the possession of landed property, which heretofore had been of no appreciable market value, but which now enabled them to raise money at pleasure, and they have too commonly used their new-born credit without reflection, borrowing more money than was fairly needed for the occasion, and squandering the excess in superfluities of living. That the prudent revenue-payer is compelled occasionally to resort to a loan is undeniable. A bad season, death of cattle, or a marriage in the family necessitate the contraction of a loan to enable him to pay the Government demand, to plough his land, or to perform a domestic duty which may not be postponed; but there has been a common disregard of caution in incurring these necessary loans, and there has been also a want of care in devoting the profits in good years to the redemption of debts.

4. The efforts of the money-lenders as a class are now commonly turned to involving the landowner in such a burden of debt that its liquidation is only possible by the transfer of his land to themselves. They are, as a general rule, rapacious and unscrupulous; the sum lent is reduced by preliminary reductions, payments by the debtor are either not credited at all or are credited at less than their value, and exorbitant interest is rapidly piled on interest. The dealings of the money-lending class in the more populous parts of the Punjab may not inappropriately be designated as a system of open plunder; the lenders and the borrowers do not stand on an equal footing; and, as a rule, there is an absence of that free consent on the part of the borrower which is

HAP. I. Qn.14.
PUNJAB.
Mr. Melvill.

needed to constitute a valid contract. The money-lender has superior intelligence, and he takes an unconscionable advantage of the necessity, ignorance, and carelessness of the borrowing agriculturists. It must be recollected that in the Punjab the mass of the agricultural population is composed of small peasant proprietors, and that there are but few large landed proprietors.

In these remarks I am alluding chiefly to the peasant proprietors.

5. On the other hand, it cannot be denied that the Punjab agriculturist is shrewd, and that he has now learnt to deny even just claims, and to invent all kinds of false pleas when brought into court for a debt.

6. A very general opinion is expressed by the officers who have written on this subject, that the main remedy for the existing state of things is to be found in the better education of the agricultural class. I confess that I have but little faith in this. The agriculturist ceases to follow the plough when he has undergone anything but the most rudimentary learning. In fact, he becomes physically incapacitated from doing so if subject to tuition for any length of time. The daily attendance in a room for many hours incapacitates him from enduring the heat of the sun and the hard labour necessary for farming operation, and the hand inured only to the pen becomes unfitted for the plough. It is a well-known fact that the village boy who has undergone a course of Persian, geography, and arithmetic disdains the furrow, and leaves his land to the care of a tenant. I believe that it is not desirable to teach the labouring agriculturists of the Punjab anything beyond simple writing and reading. Could even this amount of education be imparted to the rising generation, a great step would have been gained in putting the agriculturist in a position to hold his own against the banker; but unless attendance at the school up to a certain age is made by law compulsory, it is much to be doubted whether the people will send their sons for instruction. Compulsory education involves a great deal of interference by subordinate Government officials, and the preparation of registers of births, deaths, and marriages, and it would probably not be expedient to introduce such a measure at present.

There will occasionally be found men who desire to raise themselves above the herd, and every facility should be given to them to obtain a superior education; and this can be obtained by resorting to the higher-class schools. But for the agricultural population generally I do not think that the education provided by the Government can be too elementary. If the existing state of agricultural indebtedness calls for a remedy, it must rather be looked for in a measure which shall restrict the credit of the landholders rather than in any rapid improvement of their education.

7. There are still large numbers of the agriculturists who have not become indebted, but it is to be apprehended that these numbers will year by year diminish. There is a strong spirit of emulation abroad in regard to expenditure on social matters; the style of living of all classes is improving; and a general tendency is shown on the part of the agriculturists to be drawn into the vortex of extravagance.

8. The Government is the superior landlord, and, as the recipient of a share of the rent of the land, is directly interested in the welfare of those who are the recorded owners of the proprietary right in land. The Government can hardly be regarded as acting wisely in standing by with folded arms while these people are undergoing a gradual, but no less certain, process of extinction. Although there are no complete or reliable statistics to show how far the ancient landowner has been evicted by the sáhukár, I am convinced from my own experience that very extensive transfers of this kind have already taken place, and are now daily taking place, in some of the richest districts in the Punjab, the most prominent instances of which are the Hoshiárpur and Jullundur districts. It may be said that the capitalist whose hereditary occupation is that of banking will lay out money on the improvement of the land, and in some cases this may be true; but hitherto his aim has too generally been to squeeze as much out of the tillers of the ground as he can, and he does not spend money on the land. His first step is commonly to oust the proprietor from the cultivation. Whether he obtained the land by sale or mortgage, the condition of the transfer is that he shall be put in possession of the cultivating as well as of the proprietary right, or, if his condition of the transfer of the right of cultivation has not been expressly provided, and the courts in consequence refuse to put him in possession of the cultivation, he will take care to see that no doubt is left on this point in future deeds to which he is a party. The result of the present condition of the two parties is, that the hereditary banker, the bannia, sáhukár, evicts the cultivating proprietor from his land, and that the latter, driven from house and home, becomes a disaffected and disloyal subject. Let but this process go on for another 50 years, and the Government may find itself face to face with a serious political danger.

9. I, therefore, submit that it is the part of Government to provide a remedy for the evil before it is too late.

10. In my memorandum of the 11th June 1872, I did not intend to suggest any alteration of the law so as to affect the transactions of borrowers and lenders out of court. The whole object of what I wrote was in relation to the action of the courts in decreeing interest. Since that time the book circular of the Chief Court, No. 3 of 1873, has been issued. This circular meets to a very great extent the evil which it was my wish to remedy, and I am of opinion that it would now be sufficient, so far as the action of the courts is concerned, were it to be further enjoined that the equitable principle laid down in the circular should be applied in going behind the terms of a bond so as to unravel the real nature of the transaction, and ascertain the principal amount with a view to the adjudication of such a sum by way of interest as might seem equitable in cases where, owing to the absence of free consent, the elements of a perfectly enforceable contract were wanting.

On a careful consideration of this subject I am not prepared to recommend any alteration in the law of interest where the rate of interest has been agreed upon by the parties concerned.

11. But there are two measures which seem to be necessary. The first is, that the law of limitation should be altered, and the second, that the credit of the owners of land in the Punjab should be restricted.

12. The history of the law of limitation in the Punjab is as follows:—

In the rules issued by the Governor-General for the administration of civil justice in the Punjab, issued in 1849, the period for the recovery of debts on bonds or accounts was 12 years; in 1856* the limit was reduced to six years; 1859† the limit of six years was retained for debt on bond below Rs. 50, and on registered bonds for and above Rs. 50, but it was reduced to three years for debt based on unregistered bonds above Rs. 50 and on accounts; in 1867 Act XIV. of 1859 was introduced, and this has been followed by Act IX. of 1871, which is now in force, and by both these laws the limits for suits on registered bonds is six years, and for suits on unregistered bonds and accounts it is three years.

13. When the change was made in 1859 from the limitation of six years to three years for debts on account or unregistered bonds, there was much apprehension created in the minds of the bankers. I recollect that this apprehension was often expressed to me, and when I have alluded to the subject of late

CHAP. I. QN. 14.

PUNJAB.

Mr. Melvill.

years I have generally found both the banking and agricultural classes opposed to the shorter term of limitation. It may be agreed that a short period for the adjustment of account works to the advantage of the agriculturist, who is thus able to recollect and prove the transactions in which he has been engaged, and that a longer period would result in his finding himself involved in a hopeless well of difficulty; but, although there is truth in this position, it is also true that three years is frequently an insufficient term to allow of a debt being paid off. The margin of profit left to a peasant proprietor, whose holding is ordinarily small, is narrow, and, supposing that he has recourse to a loan in a time of difficulty, such as the failure of the harvest or death of cattle, it all depends on the two next years being plentiful whether he is able to pay off the loan or not. If these fail, the creditor is compelled by the law of limitation to take a fresh bond including the interest due on the first loan, and then the difficulties of the borrower become serious. Were a period of six years allowed for unregistered and of twelve years for registered loans, I believe that the difficulties of the borrower would be materially lessened. I believe that the knowledge on the part of the lender that he would have a fair time within which to realise his dues would tend to reduce the rate of interest, and that the honest borrower would be able to repay the debt, which now he often cannot do. An alteration of this kind in the law of limitation would be hailed as a great boon by both bankers and agriculturists. A very considerable reduction in the amount of litigation might be expected to result from this change.

14. The most important point, however, is to curtail the credit of the landowners, and this can only be done by placing restrictions on the voluntary transfer of the proprietary right in land. Sales of ancestral land by order of court are practically unknown, in consequence of the Chief Court refusing to sanction them, and therefore the restriction required must be placed on so-called voluntary transfer. The restriction might be that no transfer of the proprietorship of land by private sale should be permitted in payment of a debt to a creditor, whether alien or of the brotherhood, and that mortgages should only be allowed for the lifetime of the mortgagor to a creditor; that no sale or mortgage for a term beyond the life of the mortgagor to parties other than creditor should be allowed without the sanction of the deputy commissioner and commissioner; and that that sanction should not be granted if the transaction is in any way connected with the payment of a debt. By such provisions the mere money-lender would be prevented from getting land otherwise than by fair purchase in the open market; while the legitimate transfer of land by parties not indebted would be practically free.

15. The result of such a course might perhaps be a depreciation in the value of land, but probably not to any serious extent. What is wanted in the Punjab is to prevent the hereditary owners of land from being evicted by the pressure of debt, and if this end is attained a slight depreciation in the market value of land is not of much consequence.

16. The question then arises whether the agriculturists would find the money-lenders willing to advance loans for necessary purposes under these conditions. The fact is that the great body of the lenders are dependent on the agriculturists for their business, and there seems no reason to believe that they woulp hesitate to continue their dealings with them, though they would take care only to advance such amounts as there was a fair prospect of recovering. They would not lend in a reckless way, as they now do, in order to hopelessly involve the debtor with a view to eventually getting his land. They would find themselves very much in the same position as in the Sikh time. Nor do I think that the rate of interest would increase. The banking class is the most valuable section of the community, and is entitled to a fair consideration of its interests. The object in what I suggest is to prevent the unfair use of their opportunities.

17. It is a question whether the Government should not, in the event of the above suggestions being approved, set on foot a scheme for redeeming outstanding mortgages held by alien money-lenders, with a view to the reinstatement of the mortgagors in their land. As, however, the measures which I have suggested are radical, and open to many opposing considerations, and the subject is one on which great differences of opinion exist, I would recommend, in the event of the Government not being prepared to take any immediate decisive action, that statistics should be collected each year showing, as far as possible, the state of indebtedness of the agricultural population, and full details of the alienations of land.

18. It would be a good thing if imprisonment for debt were abolished. It but rarely happens that agriculturists are imprisoned on this account, but it seems advisable to remove an engine that may be used for pressing and ruining those who are engaged in husbandry.

19. It is very desirable that some change should be made in the Civil Procedure Code in regard to the attachment and sale of crops in execution of decrees for money. At present the standing crop is not unfrequently attached; a watcher is appointed at the cost of the debtor; and when the grain has been harvested the whole is sold by auction, and the proceeds, after deducting the amount due as Government revenue, are made over to the judgment-creditor. Now, it may sometimes be necessary to attach a standing crop to prevent its being suddenly reaped and made away with, but the attachment should never be made until the crop is about to ripen; and in regard to the appropriation of the yield, it would appear to be in consonance no less with equity than the spirit of the Code to provide that the creditor should only receive that portion of the net produce which remains after paying the Government revenue, or, in other words, that the creditor should get only the proprietor's profit. It would follow from this proposition that the produce of a non-proprietary cultivator could not be touched in execution of a decree for money.

To allow a judgment-creditor to appropriate the whole of the produce that remains after satisfying the Government demands is palpably unjust; for not only is the cultivator thereby deprived of the means of supporting himself and his family, but he is incapacitated from cultivating the land in future without incurring fresh liabilities.

NORTH-WESTERN PROVINCES.

NORTH-
WESTER
PROVINCE

Mr. Buc

Two statements are appended, of which the first shows the number of sales which have occurred in each district of the North-Western Provinces in the three years 1874–75 to 1876–77 inclusive. The second shows the total amount of property transferred in the whole province during four years. The amount of revenue transferred is given, but the area of land transferred is not known. Only, therefore the number of years' purchase of revenue can be given and not the price per acre. A rough calculation can

AP. I. QN. 14.

NORTH-WESTERN PROVINCES.

Mr. Buck.

however, be made of the latter by multiplying the average revenue rate per acre by the number of years' purchase of revenue in each district. If the revenue rate in cultivated area is Rs. 2, and the number of years' purchase is 10, then the price per cultivated care will be Rs. 20.

It will be observed that in the Meerut division and in Gorakhpur and Basti, in which parts of the North-Western Provinces the revenue is low, prices have a tendency to be higher than elsewhere when tested by the number of years' purchase of revenue. The actual price per acre does not, therefore, vary so much as the figures in columns 5 and 9 of the district statements would infer. The rate of revenue in Cawnpore, for instance, is Rs. 2-8-0 per acre, and the number of years' purchase of revenue is Rs. 8; the average price per acre is, therefore, Rs. 8 × Rs. 2-8-0 = Rs. 20. In Muzaffarnagar the rate is Rs. 2, and the number of years' purchase Rs. 20; the average price is, therefore, per acre Rs. 40. In Bulandshahr the rate is Re. 1-8-0, and the average number of years' purchase is Rs. 25; the price per acre is, therefore, Rs. 37½.

The general result is to show that the price of land ranges from between Rs. 2 and Rs. 12 per acre in the Jahánsi division and Bundelkhand, to a maximum of Rs. 51 in the Basti district and Rs. 54 in Dehra. In the permanently settled districts prices vary from 10*s.* to 25*s.* per acre; in the Lower Doab from 18*s.* to 20*s.*; in the Middle Doab from 15*s.* to 25*s.*; in the Upper Doab from 18*s.* to 49*s.* and in Rohiland from 13*s.* to 34*s.* It is a significant fact that the value of land in the permanently settled districts, except Jaunpur, is less than in most of the temporarily settled districts.

The best answer to the question as to transfer from the agricultural to non-agricultural classes is to quote a note on the subject compiled in the Board of Revenue, in 1873, for 11 selected districts:—

NOTE on the STATEMENTS submitted in reply to the BOARD OF REVENUE CIRCULAR No. 455, dated 25th April 1873, on the transfer of landed property from Agricultural to Non-agricultural Classes.

1. The Board in April last called upon the settlement officers of the 11 districts* for returns showing the extent to which landed property had been transferred during the last settlement from the possession of the old proprietors into the hands of non-agricultural classes. A form of return was prescribed, and it was explained that the term agricultural was intended to include persons connected with land by long association,—such as talukdars, as well as those who follow agriculture as a profession. Under the head of non-agricultural would come classes holding landed property as a source of income, but not the main source of income, whose connection with the land was an accident, not a custom, such as professional money-lenders, Government servants, &c. Replies have been received from all districts except Budaun, where there is now no Settlement Officer. The reply furnished by the collector of Mainpuri, to whom the Assistant Settlement Officer on leaving the district had made over the reference, was obviously incorrect; and Mr. McConaghey, the recent Settlement Officer, has, from the records by him at Naini Tal, supplied the information in another form. The reply from Cawnpore embraces two tahsils only.

2. These statements show the extent to which land has actually been *transferred.* They do not show the extent to which it is *encumbered.* They give an index to the losses of the old agricultural proprietors during the last 30 years; but they do not give any clue to the obligations of present proprietors.

3. The result, taking the extreme periods of reference given in each case, is as follows:—

District.	Former area as given in column 4.	Former area held by Agriculturists.	Per-centage.	Present area as given in column 4.	Present area held by Agriculturists.	Per-centage.
Muzaffarnagar. -	981,458	872,081	89	999,901	793,150	80
Aligarh (4 tahsîls).	767,146	716,249	93	778,818	555,719	71
Farukhabad,	1,047,025	953,923	91	1,027,915	891,528	87
Etáwah -	546,789	495,533	96	574,025	429,410	75
Sháhjahánpur.	849,411	797,311	94	922,302	769,343	83
Bijnor -	535,328	519,342	97	452,142	390,873	86
Allahabad -	1,667,104	1,546,995	92.8	1,667,104	1,313,177	78·7
Azamgarh -	902,450	872,837	96.7	902,450	835,851	92·6
Cawnpore -	236,740	126,581	53	262,398	111,617	42
Agra (8 tahsîls).	1,008,570	806,435	79	990,435	777,508	78
Total -	8,542,021	7,707,287	90	9,377,490	6,868,176	73

According to these returns, the agricultural proprietors, in the area given here, held 18 per cent. less than at the commencement of last settlement. Non-agricultural proprietors, instead of 10 per cent., now hold 27 per cent. of the revenue-paying area. The figures, as above stated, do not show how much is held by conditional mortgage, or how much is hypothecated.

4. The figures, though perhaps not in all cases absolutely correct, are quite sufficiently so for the purpose of the Board. The records from which they were drawn are reliable; and such inaccuracy as there is will arise from the partial absence of records, or from haste in drawing up the statement.

5. The Settlement Officers have in many cases furnished comments on the statements. The results in each district may be briefly noted.

6. Muzaffarnagar.—In this, as in most other districts, the results furnished by different parganas vary widely. In Muzaffarnagar itself the area owned by non-agriculturists has increased from 10,268 to 18,993—from 18 to 32 per cent. In Burhanah it has decreased from 4,949, or 11·75 per cent., to 1,038, or 2 per cent. In Bugrah it has increased from 8,029, or 14·25 per cent., to 15,759, or 28 per cent. In Bhokurheree from 14,060 acres, or 18½ per cent., to 33,199, or 42·75 per cent. Mr. Cadell, who has analysed the causes of transfer in the several parganas, notices that it is the thriftless Muhammadan proprietors, and not the village communities, who have chiefly suffered. He also notes that severity of assessment has had little to do with the transfers. The characteristics of the new class of proprietors are described in paras. 28 to 29 of Mr. Cadell's note. The great mass of transfers took place from 1840 to 1860. In the decade between 1860 to 1870, during which Muzaffarnagar has been under settlement, transfers have been few, and the amount less than the average of the two preceding decades.

7. In Aligarh there have been extensive transfers. In tahsil Atrauli non-agriculturists, who in 1840 owned 8,507 acres, or 4 per cent. of the area, now own 49,187, or 22 per cent. In Hathras the area in their hands has increased from 35,134 acres, or 21 per cent., to 90,983, or 52 per cent. In Iglas they now own 27 per cent. of the tahsil against 4 per cent. at last settlement. The periods during which the transfers were effected differ in the several tahsils, and the Settlement Officer has not offered any detailed remarks. In Atrauli and Iglas they occurred principally between 1860 and 1870; in Hathras between 1840 and 1850; in Khyr (where details of one decade are wanting) between 1840 and 1860.

The Settlement Officer writes that "it may be

CHAP. I. QN. 14.

NORTH-WESTERN PROVINCES.

Mr. Buck.

" assumed as tolerably certain that not less than about " 20 per cent. or one-fifth of the entire area of the " district has fallen into the hands of the non- " agricultural classes between 1840 and the present " settlement." The talukdars in this district have generally held their own, the village communities having been the chief sufferers, a state of affairs precisely the reverse of what has occurred in Muzaffarnagar. So again, while the Settlement Officer of Muzaffarnagar is of opinion that the pressure of the assessment has not affected transfers in Aligarh, it is in Hathras, "which has always had to bear an abnormally heavy assessment," that transfers have been most extensive.

8. In Farukhabad the changes have been less marked: 13 per cent. only of the district is in the hands of non-agriculturists, against 2 per cent. in 1803. It is noticeable that in the three parganas of Shamsabad East, Khakatmau, and Shamsabad West, in which transfers have been most extensive, the assessment does not seem to have been heavy. The periods into which the transfers are arranged do not admit of any comparison between the several decades. It can only be said that transfers have been less numerous since than before 1837.

9. The officiating Settlement Officer of Etawah has supplied comments on his figures, which have again been criticised by the recent Settlement Officer, Mr. Crosthwaite, who questions the conclusions drawn by Mr. Neale, and apparently with reasons. The greater part of the transfers, comparing decade with decade, occurred between 1840 and 1850, and in each successive decade they have become less extensive. One-quarter of the district, however, is now held by non-agriculturists, whereas one twenty-fifth only was so held in 1840.

10. In Sháhjahánpur transfers occurred chiefly between 1840 and 1860. In this district, compared with the average of the first two decades, the ratio of transfer has somewhat increased during the last decade. In the Tilhar tahsîl the area occupied by non-agriculturists has doubled in 30 years; in Pawayan it has quadrupled. The larger amount of transfers occurred between 1860 and 1870 in tahsîl Sháhjahanpur, and, compared with the average of the two former decades, in tahsîl Pawayan. The Assistant Settlement Officer has given a valuable note on the transfers in this district, in which he ascribes to the pressure of the assessments the chief part in the causes of transfer. He divides the parganas into those which are (1) heavily, (2) moderately, (3) lightly, assessed, and shows that the per-centage of transfer, after eliminating disturbing causes in each, has severally been 24·5, 9·4, and 6. The village communities appear to have been the class chiefly affected.

11. Bijnor does not show very extensive transfers, except in the parganas of Mandawar and Bijnor. The Settlement Officer in para. 11 explains the exceptional circumstances of the former pargana, but says nothing of the latter. Since 1860 the amount of transfers has lessened. The Settlement Officer attributes this to the increased prosperity of the proprietors, but it is probably as much due to settlement operations (which commenced here in 1864, and are still in progress), it being a well-known rule that during the progress of a settlement transfers are generally suspended, parties holding a lien on the land preferring to wait until the amount of the new assessment is declared. The chief losers have been the Jats (who are the back-bone of the agricultural population) and the Syuds, who have strong social influence, but are not otherwise of importance. The chief gainers have been money-lenders.

12. In Allahabad, transfers have been extensive in Karrah, Sikandra, Arail, and Muh only; the two latter fully assessed, the two former more or less lightly. Transfers occurred chiefly between 1850 and 1860, and have in the last decade fallen off. The Settlement Officer attributes this to the increasing prosperity of proprietors under a light assessment; but if this is the case, it is not clear why in Nawabganj, Soraon, and Kurari, parganas exceptionally lightly assessed, the amount transferred during the last decade should so largely exceed the transfers in any previous decade. If, as prosperity increased, transfers became fewer, *à fortiori* in parganas always prosperous transfers towards the close of a settlement should scarcely occur at all.

13. In Azamgarh, excepting in Nizamabad, transfers have been few.

14. In Agra they have been extensive in Iradatnagar only, while in seven parganas non-agriculturists would seem to have actually lost property. The chief transfers seem to have been during the first decade of the settlement; but the Settlement Officer, who has but recently joined the district, does not offer any criticisms.

15. Cawnpore calls for no special remark; and the Mainpuri return (which is exceptional in form) has been analysed by the Settlement Officer. The Rajput and Ahir village communities have been the chief sufferers—Brahmans, Marwaris, and Bannyahs being the principal purchasers.

16. The conclusion to be drawn from the figures seems to be that, though transfers may have been on a smaller scale than was supposed, they have nevertheless been considerable; that the land is beyond doubt passing into new hands; and that, at the ratio of the last 30 years, the whole of the country would be in the hands of non-agricultural classes in 150 years, if the causes which led to transfer continue to operate. But during the last 10 years (in most districts, years of settlement) the ratio of transfer has decreased; and, if we are to judge by them, the agricultural classes are growing more secure in their property. On the other hand, it is probable that obligations, now not insisted on, will be pressed as soon as the new settlements, are concluded. Again, the recent revision of settlement, which has led to a large increase of assessment, will probably lead to an increase in the rate of transfer. Against this may be set the probability that improvidence will grow less as time goes on. The village communities, it may be noted, have suffered more than the talukdars, who have themselves in many cases acquired large properties at the expense of the village communities. The pressure of existing embarrassments, combined with an enhanced demand, will, probably, rather accelerate the rate of transfer among the communities during the next 10 or 12 years.

17. Whether the new men are a source of strength to British rule, and whether it is for the benefit of the money-lending classes that proprietary rights have been conferred and long-term settlements sanctioned, it is for Government to determine. The opinions of the officers consulted differ, it will be seen, considerably, and the verdict against the new men is by no means unanimous. The rate of transfer, should extensive transfer to a new class seem open to objection, does not seem to call at present for very drastic measures; and it seems desirable rather to check than to prevent transfers, and to keep in sight the fact that the village communities are at least as much affected as the large holders, for theirs is the most difficult case to deal with, and their numbers give them great importance.

CHAP. I. QN. 14.

BENGAL.

Mr. Toynbee.

BENGAL.

Price of land; sales of land, &c.—The answer to this question is given, district by district, in a statement* received from the district officers in reply to a circular asking for the information.

Sales for arrears of revenue are, generally speaking, owing to the voluntary default of persons wishing to sell their estates. Purchasers pay a larger price at a sale held by the collector for arrears of revenue than they would pay at a civil court sale, under the idea that they secure a better title at the former. It may be confidently asserted that in no district in Bengal does the land revenue press heavily on the soil; on the contrary, it is less than half what it would have been had it not been for the introduction of the permanent settlement—*vide* answer to question 13. No information is available as regards the amount of land sold for decrees of court. Both in civil and revenue court sales the amount of the land, or share in land, which is to be sold is not specified. The terms of the sale are that the purchaser shall buy such right, title, or interest as the judgment-debtor may possess—whatever it be. Whole estates are very rarely sold. The majority of sales are of shares in land only, and do not even specify the extent of the share. Until the passing of the present Land Registration Act, which was introduced with a view of remedying this state of affairs, the same procedure was followed in the collector's office. The registration of a transfer was purely voluntary, and no obligation was on the transferee, if he did register it, to state his specific share or interest. The Act above referred to has not yet been fully worked out, but is now in full operation, and may be expected to be finished within a year. The returns submitted to the High Court by the subordinate civil courts do not even specify the price paid for such interests as are sold by them, and they are quite valueless for purposes of comparison.

CHAP. I. QN. 14.

BENGAL.

Mr. Toynbee.

CENTRAL PROVINCES.

CENTRAL PROVINCES.

Mr. Nicholls.

Average price of land.—We cannot give reliable figures. In many cases of transfer of land, perhaps in the majority of cases, there are circumstances and considerations which, without special and minute inquiry, will never come to light: for instance, old debts may be foregone, and the parties may agree to evade the stamp duty by concealing the full consideration, or in cases of auction sales, subject to lien, the bids offered in court may be only a portion of the amount which the purchaser will have to pay, or the decree-holder may have unrealisable claims against the property to be sold, so that it is the same to his pocket whether he bids 600 or 1,000 rupees for the land.

Again, land is not sold at acreage rates. But I think we may safely say that there is much capital ready to be invested in the purchase of land, provided that the land promises to pay at from 12 to 9 per cent. annual income on the investment. This will vary in different districts. In Chhattisgarh, Balaghat, Bhandara and Chanda, land will very rarely fetch such high rates. Competition for land is keenest in Wardha and the Nerbudda valley and Jubbulpore.

Amount of land sold annually for arrears of revenue and for decrees of court.—Since the settlement it has not been found necessary to sell any land for arrears of revenue in the collectorate courts. During the last three years the average amount of land sold in execution of decrees of the civil courts has been 119,396 acres, paying a revenue of Rs. 29,776.

Temporary alienations under orders of the courts have been on an average 25,991 acres, paying a jama of Rs. 9,997. We may now look for a decrease in the quantity of ancestral lands thus sold.

Amount of land transferred to agricultural and non-resident landlords.—I have no statistics or information regarding non-resident landlords. I cannot give the quantities of land nor the amount of consideration, but in respect of transfers to non-agricultural purchasers I recently showed in my registration report that (in 1877-78) there were registered 1,493 documents alienating land by sale. Proprietary rights in whole villages were sold in 207 cases, members of the trading classes acquiring these rights in 93; proprietary right in shares of villages were sold in 354 cases, and the trading classes acquired such rights in 109. Sub-proprietary rights in whole villages were sold in 16 cases, and in four the trading classes acquired these rights; in shares of villages there were 25 exchanges, three of which fell to traders. Minor rights in land were sold in 2,797 cases, traders and bankers purchasing such rights in 746.

The following are the statistics for the two preceding years:—

	1875-76.	1876-77.
Total number of documents alienating land by sale - - -	2,998	4,075
Proprietary rights in whole villages sold to bankers and traders - - - -	89	110
Ditto to others than the above - -	130	110
Proprietary rights in shares of villages sold to traders and bankers - - -	115	116
Ditto to others than the above -	297	236
Sub-proprietary rights in villages sold to bankers and traders -	3	18
Ditto to others than the above -	6	4
Sub-proprietary rights in shares of villages sold to bankers and traders - - - -	4	17
Ditto sold to others than the above	8	7
Other minor rights sold to bankers and traders - - -	655	913
Ditto to others than the above -	1,691	1,972

hap. 1. Qn. 14.

Berar.

Mr. Dunlop.

The correctness of these figures is confirmed by the following statement of sales of land in the Amraoti district in the year under report, which had been bought only in the previous year, and were re-sold.

Statement showing a few instances in which Land was recently sold and re-sold at a profit under Registered deeds:—

Land sold.			The same land re-sold for	Number of years' Purchase of Assessment.
Area.	Rent.	Price sold for.		
A. g.	Rs. a. p.	Rs. a. p.	Rs. a. p.	
12 23	18 0 0	300 0 0	343 0 0	19 years' purchase.
16 18	26 0 0	100 0 0	300 0 0	11 do.
100 16	172 0 0	700 0 0	1,000 0 0	6 do. (nearly).
12 32	25 8 0	200 0 0	300 0 0	12 do.
23 0	37 0 0	375 0 0	625 0 0	17 do.
36 34	48 0 0	100 0 0	361 0 0	7½ do.
16 25	26 0 0	90 0 0	260 0 0	10 do.

It is possible that some of the sales given in the first statement may have been fictitious; but this is impossible in the temporary alienations given in the second statement, and highly improbable in the sales and re-sales enumerated in the third statement, which were all registered. For this last statement I am indebted to the courtesy of the Inspector-General of Registration.

Sales of land under decrees of court require the sanction of the commissioner in cases of self-acquired land, and of the resident in cases of ancestral land. The number of sales effected with such sanction is shown below. I am unable to give the area sold:—

Years.	Number of instances in which Land was attached under decrees of courts.	Nos. of Sales.
1873 -	752	180
1874 -	1,042	72
1875 -	754	138
1876 -	1,075	179
1877 -	1,054	79

In the majority of cases in which land was attached it was temporarily alienated for periods ranging chiefly from one to 10 years, a few alienations being for periods of more than 10 years.

We have no reliable statistics as to the transfer of lands to non-agricultural and absentee landlords, and it would be very difficult to obtain them.

Transfers are very frequently merely nominal, made with intent to defeat the decrees of civil courts. A great deal of land is mortgaged to money-lenders.

The same remarks apply with equal force to the Akola and other districts. There is no doubt, however, I think, that the money-lenders are gradually acquiring a considerable quantity of land, which they sublet to agriculturists.

Board
Reven

Average price of land per acre.—The Board have obtained from the Inspector-General of Registration a statement showing the selling-prices of land per acre, as ascertained from the actual transactions registered in the several registration offices in the presidency during the last 10 years. It is too voluminous to be attached to these replies, but a statement compiled from it is given below, which shows the price of land in each district for 1875–76, the year preceding the famine, in comparison with the collectors' estimates of the price of "good," "middling," and "inferior" land, so far as reported by them. In some instances the collectors' estimates differ widely from the figures taken from the Inspector-General's statement, but in making any comparison between the two it must be borne in mind that the latter are averages, and that nothing is known as to the relative proportions of "good," "middling," and "inferior" lands which have entered into the calculation. In Ganjam and Vizagapatam the collector's estimates are evidently too low, as the prices of the "best" wet and dry land given by him are less than the average prices of wet and dry land obtained from the Inspector-General's returns. The Board consider the registration returns to be the best guide available in regard to ordinary selling-prices, though they probably err on the side of understatement, as the full money-value of land purchased is not always shown in the deed of sale. A portion of the consideration may be paid in other ways, or given up for various reasons, or concealed in order to evade the stamp law.

Wynad Taluk	-	—	—	—	450	350	150	45	35	20

As the selling-price of land varies greatly from very many different causes, it is necessary to be cautious in drawing inferences from the figures given in the above statement. The highest average price for Government irrigated land is Rupees 361 in Coimbatore, while in Tanjore, where lands of unequalled fertility are to be found, the average price is only Rupees 153. The explanation is that in Coimbatore the irrigated area is of comparatively trifling extent (acres 85,642), and what there is is good, while in Tanjore the irrigated lands extend over the greater part of the district, and embrace a wide variety of quality. Similar considerations affect all the other figures in a greater or less degree.

If all assessments were equal in their incidence, it might be expected that on an average the selling-prices would vary directly with the average assessment. Omitting the districts of Godavari, Kistna, and South Canara, for reasons which will be noted below, and arranging the others according to the average value of irrigated land, the order will be as follows:

	Rs.
1. Coimbatore	361
2. Tinnevelly	319
3. North Arcot	241
4. Malabar	234
5. Madura	224
6. Vizagapatam	181
7. South Arcot	179
8. Tanjore	153
9. Trichinopoly	129
10. Salem	114
11. Cuddapah	112
12. Kurnool	79
13. Chingleput	79
14. Bellary	72
15. Vellore	56
16. Ganjam	26

Arranged according to the average assessment for the same year:—

	Rs.	A.	P.
1. Tinnevelly	9	7	10
2. Coimbatore	7	5	8
3. Cuddapah	6	12	8
4. Kurnool	6	2	7
5. North Arcot	5	12	4
6. Salem	5	10	3
7. Nellore	5	7	4
8. South Arcot	5	5	5
9. Vizagapatam	5	3	11
10. Bellary	4	15	2
11. Tanjor	4	13	11
12. Trichinopoly	4	2	9
13. Madura	4	2	9
14. Chingleput	3	10	5
15. Malabar	3	0	1
16. Ganjam	2	14	4

It thus appears that in nine out of the 16 districts the selling-price and assessment go pretty well with each other:—

Coimbatore	(1)	(2)
Tinnevelly	(2)	(1)
North Arcot	(3)	(5)
Vizagapatam	(6)	(9)
South Arcot	(7)	(8)
Tanjore	(8)	(11)
Trichinopoly	(9)	(12)
Chingleput	(13)	(14)
Ganjam	(16)	(16)

In two the selling-price appears to be better than it would have been if the assessment had been proportionately as heavy as in the above, viz:—

Malabar	(4)	(15)
Madura	(5)	(13)

Neither of these districts have been newly settled. Of the following five, in which the selling-prices seem to indicate heavy assessment, Salem and Nellore have been settled throughout, and Kurnool and Cuddapah have been settled in part:—

Salem	(10)	(6)
Cuddapah	(11)	(3)
Kurnool	(12)	(4)
Bellary	(14)	(10)
Nellore	(15)	(7)

Even in Nellore, however, the average selling-price is close upon ten times the assessment.

South Canara has been omitted in the comparison given above, as the area and consequently the average assessment is not known, and in the Godavari and

CHAP. I. QN. 1

MADRAS.

Board of Revenue.

Kistna deltas the whole area is assessed as unirrigated, and a water-rate charged when necessary. The prices realised in South Canara are good,—rupees 273 for wet, and rupees 82 for dry,—and the district is known to be lightly assessed. For Godovari Kistna the rates shown by the registration returns are as follows:—

	Irrigated.	Unirrigated.
	Rs.	Rs.
Godavari - -	46	51
Kistna - - -	46	19

These rates seem to the Board to be very low, but no satisfactory explanation occurs to them. It will be seen that the collectors' estimates are very much higher, viz.:—

	Irrigated.	Unirrigated.
	Rs.	Rs.
Godavari - -	10 to 400	5 to 200
Kistna - - -	8 to 100	1 to 50

The average selling-prices of unirrigated Government land in the different districts (again omitting South Canara) are as under:—

		Rs.
1.	Tanjore - - - -	104
2.	Malabar - - - - -	102
3.	South Arcot - - -	100
4.	North Arcot - - - -	91
5.	Vizagapatam - - -	78
6.	Coimbatore - - - - -	65
7.	Trichinopoly - - -	62
8.	Tinnevelly - - - - -	61
9.	Nellore - - - -	56
10.	Godavari - - - - -	51
11.	Nilgiri - - - - -	42
12.	Salem - - - - - -	39
13.	Ganjam - - - -	38
14.	Madura - - - - -	38
15.	Chingleput - - -	28
16.	Chaddapah - - - -	25
17.	Kistna - - - - -	19
18.	Kurnool - - - - -	15
19.	Bellary - - - -	14

In the case of dry land no profitable comparison can be made with the average assessment, as the variations between different districts are very trifling, and moreover a large portion of the dry land on which it is struck has no marketable value, but is relinquished at the will of the cultivator when he finds it no longer profitable to hold it.

While on this subject it may not be out of place to show the number of deeds of sale of immoveable property of the value of over rupees 100 executed in each district in the year 1875-76:—

	District.	Number.	Value.
		Rs.	Rs.

It will be observed that, as a rule, transactions were most numerous in the districts in which the selling-prices are high.

The prices paid for land taken up for the South Indian Railway within the last few years are contrasted below with the average prices taken from the registration returns:—

District.	Average paid by Government.	Average from Registration Returns.	
		Irrigated.	Unirrigated.
	Rs.	Rs.	Rs.
1. Trichinopoly - -	168	129	62
2. Coimbatore - -	156	361	65
3. Tanjore - -	139	179	104
4. Tinnevelly - -	126	319	61
5. South Arcot - -	112	174	100
6. Madura - -	92	224	38
7. Chingleput - -	79	79	28

Amount of land on an average sold every year for arrears of revenue and for decrees of court.—The following statement shows the average extent and assessment of Government and Inam lands sold annually during the last 10 years for the recovery of arrears of revenue, and the average amount realised. A column is added to show the average selling-price per acre, and another to show the proportion of the extent of lands sold to the total holdings in the case of ryotwari lands:—

Districts.		Particulars of Lands sold.		Sale Proceeds.	Ratio of extent sold to the total Holdings for every 10,000 Acres.	Average Selling-price per Acre.	Remarks.
		Extent.	Assessment.				
		Acs.	Rs.	Rs.		Rs. A. P.

Of course, the prices realised at sales of this kind afford no criterion by which to judge of the ordinary value of land in a district. If the cultivator is in difficulties solely through mismanagement, he raises money on the land himself, and, except where fraud is practised, the creditor pays up the demand, and thus, as a rule, only the poorest land is brought to the hammer. Good land is seldom allowed to be sold, unless it has been previously ascertained that the bids can be kept down by combination. In other cases, Mirasidars, notably in the Chingleput district, take up the cultivable waste in their villages ostensibly for cultivation, but really to prevent outsiders from taking up the land; they do not, or cannot, pay assessment, and when the land is sold they have it bought up by one of their relations at prices kept down by combination, and this goes on from year to year. At other times, puttahdars, with a view to defeat the claims of creditors to lands charged with debts, wilfully neglect to pay the Government assessment, and have the land sold for arrears of revenue unknown to the creditors, and bought up by one of their own relations for a nominal price, free of all incumbrances. It is not often, however, that a conspiracy of this kind can be satisfactorily carried through.

The increase of late years in the number of attachments and sales of lands for the recovery of arrears of revenue formed the subject of a thorough investigation as lately as 1875, and the results are embodied in Board's Proceedings, dated 1st April 1874, No. 754, and G.O., 7th January 1875, No. 19. These papers are given in the Appendix, as they are likely to be of interest.

It will be observed that the average extent of land sold for arrears of revenue is nowhere appreciably in excess of one-half per cent, of the total holding, except in the districts of Vizagapatam and Chingleput. No explanation of this is at hand with regard to Vizagapatam, but, as will be seen further on, the collector of Chingleput seems to attribute it to the fact that about 40 per cent. of the land is in the hands of non-resident and non-agricultural landlords, who squeeze all they can out of the actual cultivators, and evade their obligations to Government as far as they possibly can.

No accounts are available of the extent of land sold under decrees of courts, and no attempt has been made to obtain the information from the several courts scattered throughout the presidency, as it is not likely that the necessary statistics could be collected within a reasonable time. It may, however, be generally asserted that no facts have come to the Board's notice tending to show that the landed classes are being impoverished, or that landed property is rapidly passing into the hands of new men.

Quantity of land transferred to non-agricultural and non-resident landlords.—The collectors of Godavari, Nellore, Madras, Bellary, Kurnool, Kistna, South Arcot, Nilgiris, and Ganjam report that no appreciable portion of land in their districts is in the hands of non-agricultural and non-resident landlords. In Madura it is stated that the proportion is 10 per cent., but that it does not produce any injurious effects, nor have any bad consequences been observed in Vizagapatam, where more than three-fourths of the Inam lands are reported to be in the hands of non-resident and non-agricultural landlords. In Tanjore the proportion is stated to be 10 per cent., and the collector considers that in some cases injury is caused to agriculture by the renters not effecting any improvements in their lands, or by their ill-treating their sub-tenants. The collector of South Canara estimates that one-half of the land may be approximately taken as being in the hands of non-agricultural and non-resident (*i.e.*, resident in the district, but non-resident on their estates) landowners, but states that this circumstance is not considered to have any injurious effect on agriculture or on the tenantry. On the other hand, he thinks that, as these landlords are generally men of substance, they are better able, and more ready, to carry out improvements and increase the rent value of their lands than the other less well-to-do landlords who cultivate their own estates. The collector of Coimbatore makes a similar statement. He estimates the proportion at 5 per cent., and considers that it has not produced any injurious effects, non-agricultural landlords being in general wealthy men who can spend money on their estates. The collector of Cuddapah states that half of the Inams are in the hands of non-resident, and 90 per cent. of the Inams in the hands of non-agricultural, landlords, but with no bad results, as the tenants get the lands at a low rent, and make large profits. The collector of Salem estimates the proportion in the case of unirrigated lands at one-fourth, and in the case of irrigated lands at three-fourths. No injurious effects have resulted, as agriculturists who hold lands under occupancy rights from non-resident and non-agricultural classes are generally

Chap.I.Qn.14.

Madras.

Board of Revenue.

assisted by the latter with funds for the purchase of live-stock, food, utensils, &c. Chingleput seems to be the only district in which the predominance of non-agricultural holders appears to have taken an evil form. Mr. Price writes:—"A very appreciable "portion of the lands in the district are in the hands "of non-resident and non-agricultural landlords. I "should roughly say that the per-centage is quite 40, "if not more. I consider this to be the curse of the "district. Wherever there is heavy waste to be found "in the Jammabandi accounts, one is pretty safe in "guessing at once that the village concerned is either "one, the puttahdars of which are Brahmins, or else "that it belongs to a non-resident proprietor. It is "the squabbles between these people and their sub-"tenants which cause much of the waste; they "collect from the actual cultivators and squeeze them "in every way that they can, and then Government has to hunt them down in all directions "in view to making them disgorge. The man "with capital never has anything to do with these "people, as in advancing money or having anything to do with the lands leads in nine cases "out of ten to his finding himself involved with landlords whose litigiousness is a bye-word in other "districts. I have not seen since I have been in the "district half-a-dozen fairly substantial ryots."

Taking the presidency as a whole, the Board would say that absenteeism does not prevail to such an extent as to afford any cause for anxiety.

MYSORE.

Mysore.

Col. Pearse.

Mr. Krishnaiengar.

Colonel Hay.

Good dry land fetches prices varying according to quality up to an average of about 35 Rs. per acre. Wet and garden lands are seldom sold, and when sold the prices are very variable. No separate register of the extent of land sold for arrears of revenue or decrees of court have been kept. The statements sent up for sanction frequently comprise a house, the lands, and other property, but the total collections by sales for arrears of revenue throughout the division have amounted to no more than an annual average sum of Rs. 7,000 and odd for five years preceding the famine, and considerably less than half that amount was realised from land only. I am unable to give any data with reference to land transferred to non-agricultural and non-resident land-holders.

Mr. Krishnaiengar.—The price of land is regulated by its quality and position, and the following is the average in this district:—

Dry	- - -	Rupees 10 per acre.	
Wet and petty garden	„	30	„
Areca and cocoa-nut „	„	100	„

The total extent of occupied land in this district is 426,434 acres. The average amount of land sold every year for arrears of revenue is 355 acres, and for decrees of courts, 276 acres. 640 acres of land have been transferred to non-agriculturists and 703 acres to non-residents.

Colonel Hay.—During the last eight years the prices of wet and dry lands in several taluks in this division were as follows:—

No.	Taluks.	Prices of dry land per acre.		Prices of wet land per acre.	
		From	To	From	To
	Mysore district.	Rs.	Rs.	Rs.	Rs.

CENTRAL INDIA.

Central India.

Mr. Wingate.

Sale of land is unknown in the Central India States. Should arrears of revenue be irrecoverable, Colonel W. Osborne (Bhopal) says the property of the cultivator, except his plough, cattle, and implements, are seized and sold. In Rutlam, Mir Shahamat Ali says the holding is transferred to an other cultivator; but this is rare, as a cultivator is usually helped as long as possible by advances.

Under these circumstances land has no saleable value, but in Baghelkhand it is said to be worth ten times the annual net profits.

HAP. I. QN. 15.

CHAPTER I.—QUESTION 15.

What are the wages usually paid to hired field labourers? Are they paid in kind or money? Give the rates as far as you can for the chief kinds of labour in ordinary years. Is the hired labourer usually able to subsist with fair ease on the grain or other payments he receives at harvest and other periods during the intervals between such payments, or is he frequently forced to borrow and forestall future payments?

PUNJAB.

Major Wace.

PUNJAB.

Delhi District.—It is customary for the agriculturists to employ field labourers for (1) ploughing; (2) weeding; (3) guarding the ripening crops; (4) cutting them when ripe. They are generally paid in money, to a man 2 annas, a woman 1½ annas, a child of 12 to 15, 1 anna, except in harvest time when they are paid in grain of about the same value. Sometimes a man gets Rs. 2 a month and his food for ploughing or guarding the crops. The persons usually so employed are of the Chamár, Koli, Ajri, Dhanak, Lode, and sweeper castes, who have most of them no other means of sustenance than field labour. Some of them make shoes, mend harness, weave cloth, and otherwise supply the wants of the village population, but they are almost wholly dependent on what they receive from the cultivators as wages for field labour, or in return for those services, all to the same extent connected with field labour. Very few inhabitants of the city Delhi work in the field.

I find little help in estimating the number of persons so employed from the census returns, but would put it at about 20,000, being 3 per cent. on the total population, or 5 per cent. on the population outside the town of Delhi. Such field labourers are not so indebted as the poorer cultivating proprietors, for they cannot easily borrow money, and for the same reason their subsistence between harvests in average years is more precarious. They do not generally get advances from the village traders, nor do they live long on grain or money previously earned, though that does keep them going for some time after the harvest; they work at the preparations for the next harvest, or get an advance from the cultivator who regularly employs them.

Gurgaon District.—The custom of employing hired field labourers is not quite general in this district, as the Játs and Ahirs, who own about one sixth of the district between them, generally do their field work themselves. The other tribes of landowners and cultivators, however, do employ Chamárs, Dhanaks, Kulis, Juláhás, and sweepers to weed and reap their crop at a money wage of 2 annas for a man, 1½ anna for a woman, and 1 anna for a child per day. Sometimes the wage is given partly or wholly in kind, the value being about the same as the cash wage. When not employed in field labour, these classes earn their livelihood by weaving cloth, making shoes, mending harness, sweeping villages, and otherwise providing for the wants of the villagers, who in this district generally pay them for these services in cash, and not by an allowance of grain at harvest. The census papers of 1868 (Statement IV.) give little aid in estimating the number so employed. I should put it down at 55,000, or about 8 per cent. on the total population.

The condition of these field labourers is not inferior to that of the poorer agriculturists who cultivate holdings of their own. They are not so much indebted, as they have nothing to mortgage; they do not generally get credit from the village trader, but sometimes get wages in advance or borrow a little from each other. In an average year they subsist with ease from harvest to harvest on their earnings during the last harvest and their wages for odd jobs and the profit on their cloths, shoes, &c.

Karnal District.—1. It is customary to take labourers in a kind of agricultural partnership, where they receive a fixed share of the produce, and bear the same share of the expenses of cultivation, and often of the revenue also. These men contribute their bodily labour only, and do much of the harvest work. The employer advances money varying in amount from Rs. 15 to Rs. 50 free of interest, and a further sum, as necessity arises, on interest at 3 pies per 1 rupee monthly. This debt is looked upon as a "body debt" (sarír ká karzah), and landowners often grumble at our refusal to enforce it as such by compelling the debtor to labour until it is discharged. If the employer is changed, the new employer repays the old one the sum so advanced. The advance is made by a credit with the bania; accounts are settled at harvest time. These people are, as a rule, very slightly, if at all, worse off than the very small owners and tenants so long as they are in full bodily vigour; but as their remuneration varies with the produce, they are wholly dependent upon the season; and when they get old they are unable to find employment. They belong to all sorts of castes, chiefly but not wholly menial, and are sometimes Játs, Brahmans, &c.

2. The Chamárs often furnish to a given plough one man from a family, who works on much the same terms as above. One member of the family will work one day, and another the next. Most Chamár families furnish one such labourer. They follow at the same time their trade of leather curing and working; and are as a rule well off considering their position. In a famine year the number of cattle which die go far to compensate them for the diminished yield of the cultivation. They are paid at harvest time, and get one-fortieth of the whole yield of the plough on which they work in consideration of their labour, and in addition to what is given for boots, straps, whips, &c. No money is advanced to these men.

3. There is a certain very small number of agricultural labourers hired by the year on fixed pay. They belong to no particular caste, and are chiefly found in the towns and in villages owned by Sayads and others who will not do manual labour. There are very few of them in other villages. They get 9 to 10 maunds of grain a year and their morning meal, or all their food and 0–8–0 a month, or two meals a day and clothing and Re. 1 a month, or Rs. 3 a month, one meal a day and some old clothing and pair of boots every half year; or Rs. 4 a month with or without one meal a day. They always get double pay in the two harvest months. They are of course very poor, more so than the poorest agriculturist.

4. Occasional labour is resorted to at certain seasons, chiefly at harvest time, when rice is being bedded out, and when sugar cane is being cut and crushed. The labourers usually consist of the menials of the village, and of the villagers of the high lands, who reap their yearly grain crop and then go into the low villages to help in the harvest. The wages vary from 3 to 6 or 7 sers of grain a day; and I have known 0–8–0 a day paid at harvest when a sudden hot wind ripened all the crops at once. This class of labourer includes the poorest of the people, and also really well-to-do agriculturists and others, who are attracted by the high wages offered.

5. It is almost impossible to estimate the number of these respective classes of hired labourers. Judging from my settlement figures, I should say, class I. from 3½ to 4 per cent. class II. 3 per cent., and class III. ½ to ¾ per cent. of the adult male population; class IV. is altogether too fluctuating to allow of any esti-

mate. But the above figures are little better than guesses. The adult male population of the district is about 188,000.[*]

Umballa District.—In this district there are few well-to-do agriculturists, hence they never employ any permanent hired field labourers. It is only for weeding the kharíf crops of cotton and makki, and at the rabi for the sugar-cane, tobacco and poppy crops, that hired daily labourers are entertained for two or three days at the most. The rates of wages vary according to the amount of work the labourer is able to perform; the daily labour wages range from 2 annas to 4 annas. At reaping time hired labourers are also required, but they are not paid in money; they receive as wages a load or bundle of the crop they have cut, and which perhaps may yield 4 or 5 seers of grain. There is no special class employed in field labour, but generally Chamárs of the village or other indigent persons who have no particular means of livelihood. This kind of employment at the most never extends longer than one month at a time. At other times, when not engaged in field labour, these employés work in the town as coolies, or perhaps work leather or weave

From the census papers (1868) about 10 per cent. of the whole population of the district, or 103,400 (47 per village on 2,200 villages), may be assumed to work at times at field labour. The condition of this class (field labourers) is no doubt very inferior to that of even the very poorest self-cultivating proprietors, and they never have anything in hand; in short, live from hand to mouth, and in seasons of famine stream out of their villages into the towns, having nothing to fall back upon, and no credit with the village bania, and except here and there, where employed as permanent ploughmen or herdsmen perhaps, they get no assistance from the village agriculturists. In short, in times of distress and scarcity and high prices, these poor wretches are in very evil plight. They have no credit account with the village banker or money lender.

Hoshiarpur District.—It is customary for the agriculturists of this district to employ paid field labourers.

They are principally employed for weeding and hoeing (godai) and for cutting the crop at harvest; employed in weeding and hoeing they are called "godáh"; for cutting at harvest, "laweh."

They receive at hoeing time 2 annas per diem, or 2 annas and food, or sometimes 2½ annas without food, or sometimes they are paid in grain.

At harvest time a very common way of paying them is to give them one sheaf, or half a sheaf, of grain (the sheaf contains on an average about 8 seers pakka of grain) according to the price of grain at the time.

These labourers are principally of the Chura (sweeper), Chamár, (currier), or Juláha (weaver) castes. But Zamíndár classes themselves, such as Bhats, Ját, Saini, Gujar, also occasionally work for hire in the field.

They cannot be said to form a class by themselves in the character of field labourers. Most of them have other means of livelihood, *e.g.*, the Chamár prepares skin and horns for the market, the Churas sweep the village houses, the Juláha has his loom and weaves cloth. At the same time the people who take to labour in the field when opportunity offers are mostly of a very poor class; and have, as a class, difficulty in eking out their subsistence by manual labour of various kinds.

I do not think the number of such persons is less than 70,000, probably more; I estimate it at about 7 or 8 per cent. of the total population of the district.

The above does not take account of ordinary field servants, or "*kámahs*," who are employed by the Rájpút landowners generally, and by all the richer Zamíndárs. These are employed all the year round, and engage in all field operations. They receive Rs. 1-8 and Rs. 2 per mensem and food and clothes.

I think this class, *i.e.*, "kamah," may amount to about 10,000 persons, or 1 per cent. of the population, probably not more.

The position of both, whether kamah, *i.e.*, regular labourers, or godáh or laweh called in at harvest or weeding time, is distinctly inferior to that of the poorer agriculturists who cultivate holdings of their own, because their livelihood is somewhat more precarious and they have not security of land or occupancy right, on which money can be raised by those who cultivate holdings of their own.

They live as a rule from hand to mouth by the daily labour of their hands, and cannot get much credit with the village trader.

Sialkot District.—It is customary for Zamíndárs and other landowners of good position to hire labourers for the cultivation of their fields; the work in some instances being such as to require the permanent employment of labourers throughout the year; and in others they are employed for a time only just as necessity arises for their services. The permanent class of labourers are paid in kind, viz., 20 seers on every máni (= to about 12½ maunds kacha) of crop sown, besides food three times a day and clothing. The other class, or temporary labourers, are paid in cash at the rate of Re. 1 per month and food and clothing in addition. The persons usually employed are of the Chura, Meo, and Bhatwar castes, and principally resort to this sort of work for their sustenance, though, in case no such employment could be got, they follow their own special avocations elsewhere. The private servants of the landowners, such as the washerman and water-carrier, also labour in the field, but receive no extra remuneration.

When the sowing and harvesting seasons arrive extra labourers are hired, and are paid generally according to the crops they work at; those employed in the sowing of munji, a kind of rice, get 5 seers of grain daily each, and the harvesting labourers get 1 "bhari" or sheaf of whatever grain they cut, and the out-turn of which never exceeds 10 seers; and those employed in the weeding of sugar cane, cotton, and maize get food twice a day, or in lieu 1 and 1¼ seer of grain per diem each, or 2 annas in cash, whichever they choose to select; and those employed in ploughing get the same wages as the last mentioned. The total population of the district is 1,005,004, out of which 183,291[*] are employed as field labourers, or a little over 18 per cent. of the total population. The condition of the field labourer in comparison to an agriculturist who cultivates himself is decidedly inferior in respect to affluence; he cannot subsist entirely on his labour in the field, and he is obliged to take some other work as an additional help. The labourers can generally obtain money from the village banker when they need it, and they settle with him when the harvest is reaped, or whenever they happen to have sufficient wherewith to do so.

Mooltan District.—Hired labourers are employed by all the richer Zamíndárs, who are above following the plough themselves, for their "*khud kásht*"[†] lands. They are employed for all farming operations, and receive wages sometimes in kind, sometimes in money, sometimes in both, amounting to from Rs. 3 to 5 a month. They are of all classes, except Sayads and Brahmans; they cannot be said to form a class apart; they are the outskirts of the tenant-at-will class. A tenant loses his bullocks or gets into trouble, and he works as a labourer till he can recover himself. On the other hand, a Zamíndár takes a fancy to a labourer who has worked for him for some time, and he gives him some lands, advances him money for bullocks, and sets him up as a tenant. Sometimes, too, a small proprietor meets with a temporary difficulty; in the Rawa,[‡] in long continued drought cultivation is impossible; the

---

[*] The census returns say 106,165.

[*] This is clearly an excessive estimate. The total adult male agriculturists numbered only 142,819. There cannot be more than one labourer to every agriculturist.—*E. Wace.*

[†] Their own home farm.

[‡] Dry lands, not irrigated nor alluvial.

CHAP. I. QN. 15.

PUNJAB.

Major Wace.

proprietor then sends his cattle to graze in the Bár and goes to work as a labourer until better times return. These labourers generally live on their wages with ease; they may run up petty scores for food in their bazár, but they cannot get into serious debt. But their condition is inferior to that of the poorer tenants, inasmuch as it is generally when a tenant is ruined that he becomes a day labourer; as long as a man is a tenant he has no want of the actual necessaries of life, nor has the labourer, as a rule, but he may have at any time,—at least there is the possibility of this, but I have never known it to occur practically. The demand for labour has always been in excess of the supply, and the agricultural labourers work on steadily all the year round.

Jhang District.—It is *not* customary for the agriculturists of this district to employ hired field labourers. Such labourers are very few. The mass of cultivation is carried on by tenants-at-will paying grain rents of half produce. Many of these tenants are given advances (known as takávi) of money, oxen, seed, &c., when they first commence to cultivate their landlord's well. Cultivators of sailáb lands are not given advances. The wages of a hired labourer consist, as a rule, of the following items:—His food daily; Rs. 1–8 cash per month; 2 chaddars, 2 loin cloths, 2 pagris, 2 pairs of shoes, and 1 blanket per annum. The material item is of course the food of the labourer, and this is sometimes very cheap and sometimes equally dear. These labourers are, as a rule, poor Játs. They do not practice any craft. They get their living entirely in this way. As there is usually a considerable demand for labour, there is no fear of their starving if they will work. I cannot give any estimate of the number of these labourers. They are very few—probably not more than 1 or 1·5 per cent. of the total population.

These labourers, so long as they are in employ, are well off, but the nature of their wages prevents their saving anything. They live better, *i.e.*, have better food, than the poor agriculturists who cultivate their own lands or the tenants-at-will paying batái. They are generally unmarried and without any encumbrances.

Peshawar District.—In this district hired field labourers of three descriptions are employed.

(*a.*) These who receive monthly wages which amount to Rs. 4 or 5 in cash without food, or 1–8 or Rs. 2 in cash along with food. They are employed in every description of agricultural work.

(*b.*) Those locally known by the name of *charakar*, who are indebted to their masters for sums ranging from Rs. 30 to 150, and are under engagement to give their services as agricultural labourers till such time as the debt is paid off. Plough bullocks, seed, &c. are furnished by the employer. These labourers are paid by a share of the crop in kind, which is usually from $\frac{1}{4}$th to $\frac{1}{10}$th. They feed themselves.

(*c.*) The labourers who are specially employed as cattle herds or crop watchmen. The former are paid at harvest by receiving 15 seers of grain (barley or joár) for every head of cattle grazed, or sometimes the payment is calculated not in the cattle, but on the owners or their houses. The latter are also paid in kind at harvest; they receive 1 seer per maund of grain out of every crop.

There is no tribe specially devoted to these occupations. When not engaged in agricultural work, they are ready to do any sort of miscellaneous labour. Their numbers are about 2,854, which is a per-centage of 0·55 per cent. of the total population. There is no material difference in the condition of such labourers and that of the poorer agriculturists who cultivate holdings of their own. The *charakars* are generally in debt; they borrow money under promise of paying it back at harvest, but with that exception the labourers are well able to live upon their earnings. Those who watch crops are, as a rule, very well off.

NORTH-WESTERN PROVINCES.

NORTH-WESTERN PROVINCES.

'apt. Pitcher.

In the Muttra, Mainpuri, and Cawnpore districts cash payments would appear to be most in vogue, but elsewhere the replies indicate that in ordinary years payments are mostly made in kind. During the past year, however, either owing to the fluctuating nature of grain, rates, and their height, or owing to zamindars having less grain on hand than usual, payments have been made in cash. Such payments have been at lower rates than what the payments in kind of ordinary years would represent in cash. Necessarily, save where Government relief works came into competition, people were anxious to work at any rate. In May last, when discussing with a zamindar the *pros* and *cons* of a bund upon the making of which I had set my heart, he remarked with emphasis, "Now 'is the time to get the work done, as labour can be "got so cheaply."

The hired labourer ekes out his gains at harvest time by selling grass, cutting wood, repairing houses (an operation always carried on at slack seasons, when the owner can sit all day, taking care that the labourer does his full tale of work), carrying loads of grain, wood, cowdung fuel, fruits, &c., to market; protecting fruit, groves, or ripening fields from the depredations of birds and other thieves, &c., &c.

A labourer's earnings depend of course on his industry, and in ordinary years there are always fair earnings to be got for the industrious. A lazy fellow who only works when forced to do so, for as much as will keep him alive, is sure to be well known in the village, and to find it impossible to borrow or forestall. The industrious borrow and forestall as much as they can, not to gratify personal extravagance or tastes, but to meet caste obligations in the way of marriages, burials, funeral rites for their ancestors, &c., obligations which the most honest of the poor would rather face death than attempt to evade. It may safely be stated that the majority of industrious labourers owe some sum, small or great, and are ever ready to borrow or forestall when credit is to be got. That credit is given so generally is due to the solemn obligations resting on children to discharge the debts of their fathers.

In towns a numerous class of money lenders are to be found who deal with the labouring poor almost exclusively, lending small sums of Rs. 2 or so, at high rates of interest, repayable by daily payments of perhaps as little as a pice. For the collections of these petty sums Brahmans alone are employed, a fact due no doubt to the superstitious feeling on the part of Hindus against refusing a Brahman's reasonable request, and a relic of the times when Brahmans were sent to sit "dharna" at the doors of impracticable debtors.

These collectors go their daily rounds, and for each default "chalk" up a mark over the debtor's doorpost. It would surprise many of those who hold a low opinion of Asiatic morality to see how large an average of good faith exists on the part of the money lender, who keeps the only written record of payments; on the part of the collector, who commits his collections to memory; and on the part of the debtors, who never venture to tamper with the writing on the wall.

These loans are sometimes contracted for the purpose of carrying out some small business or petty contract, but mostly for marriages, and very often to help some neighbour neither related by blood nor connected by caste, but simply without credit.

The labourer's life is hard enough in all conscience. One of the last scenes is frequently a visit from his various creditors, who come and make their demand while he lies on his death bed, so that the heirs of his cooking pots and mud hut may be advised. It is a common plea on the part of the heirs-at-law when resisting a claim against the property of a man lately dead, that the creditor failed to make any claim while the man lay dying.

STATEMENT showing Rates of chief kinds of Labour in ordinary years.

District.	Weeding and Digging, &c.	Irrigating.	Harvest operations.	Artisans.	Ploughmen or permanently employed Servants.	Remarks.
Maerut	In cash 2 annas, usually the value in kind	—	1 bundle in 20, 1 in 14 for cotton	4 annas a day	—	Sugar-cane labourers 4 annas a day.
Meinpuri	6 or 7 pice	2 annas	1 do. in 20	—	Rs. 2-8-0 per mensem, with a blanket occasionally.	
Muttra	Rs. 3 a month or 2 annas a day	—	3 seers extra of harvest labour	—	Rs. 3 per mensem	Sell grass in off seasons.
Etáwah	1 anna 6 pie to 2 annas in kind	—	—	4 annas to 5 annas	—	
Aligarh	1 anna 6 pie	—	5 seers a day, and straw with it	—	Rs. 2-8-0 or Re. 1 and food	
Farukhabad	1 anna 6 pie to 2 annas in kind	2 annas and food	1 in 20	—	Rs. 3 per mensem.	
Muzaffarnagar	2 annas usually, but this year 1 anna 6 pie	—	2½ annas a day	—	—	Eke out by sale of grass, buildings, &c.
Bulandshahr	Rs. 3 a month	—	—	—	—	No other particulars given.
Budaun	2½ seers, grain	—	1 in 20	7 annas to 7 annas 8 pie.	—	
Moradabad	1 anna to 2 annas 6 pie	1 to 2 annas and a meal.	1½ to 2 seers or 2½ annas	—	6 annas a day for hire of man and bullocks.	Get advances for labour from zamindars.
Cawnpore	2 annas to 3 annas	—	—	—	—	
Mirzapur	1½ to 2 seers, with chabena extra	¾ of a seer, with chabena and cane-juice.	¼ seer gur daily when working at sugar-cane as well as wages.	—	A piece of rent-free land near their house.	Re. 1 cash and a blanket per annum extra to permanent servants.
Gházipur	1 anna or 2 seers coarse grain	1 anna	—	—	1 anna 6 pie	Labourers get 1 bigha ploughed and sown for them free.
Benares	2 to 3 seers, this year 5 pice	—	—	—	—	
Gorakhpur	1 anna or 2 seers coarse grain	1 anna	2 seers wheat, or 4 seers coarse grain	3 annas	9 pie	This year payments have been in cash.
Tarái	1 anna to 1 anna and 6 pie	—	—	—	Rs. 2 to 3 per mensem	A blanket and pair of shoes annually to regular servants.
Kumaun	No regular labourers; people help each other in all farming operations.	—	—	--	--	In the bhábar ¼th of the crop.
Garhwál	2 seers a day of millet, 2 annas in tea gardens	—	—	7 annas 8 pie	—	
Jalaun	1 anna to 1 anna 6 pie kharíf, 0-1-6 to 2 ans. rabi	—	2 annas to 3 annas	—	—	Forestal their earnings, pledging their labour.
Lalitpur	9 pie, men; 6 pie, women	—	—	—	Rs. 1-8-0 per mensem	Hire of 7 yoke of bullocks 4 annas a day, and an occasional blanket.
Sháhjahánpur	1 anna to 2 annas	—	1 in 20	—	Rs. 2-8-0 ditto.	
Lucknow	This year 5 pice, 1 anna to some, or 2 seers	7 pice	—	16 seers on each plough.	Rs .2-8-0 and food	Eked out by carrying loads and selling grass.
Bara Banki	This year 5 pice, or 3 seers kodo	—	1 in 16 rabi, 1 in 13 kharíf	—	—	House repairing, sell grass, carry loads.
Unaó	1 anna 6 pie with ¾ seer chabena	—	—	—	½ a bigha with seed, 3 mds. at rabi, and 3 at kharíf.	
Rae Bareli	This year 5 pice, usually two seers	3 seers	—	Well diggers, 2 annas.	—	House repairing in the slack season gives work.
Partabgarh	1 anna 3 pie to 1 anna 6 pie	—	1 in 20.	—	—	
Fyzabád	1 anna to 2 annas; cultivators afford mutual help	5 seers or 2 annas	—	—	Rs. 2 to 2-8 per mensem	5 pice a day wage during scarcity.
Gondá	1¾ seer	2 seers	1 in 16	2 annas	2 seers a day.	
Kheri	1 anna a day	—	1 in 16 and 5 seers treacle	—	Rs. 2 per mensem	A blanket, or petticoat for the women.

.I. QN. 15.

ENGAL.

. Toynbee.

BENGAL.

The rates of wages of agricultural labour are given, district by district, in column 9 of the statement appended to question 13. Harvest labour is, as a rule, paid for in kind throughout Bengal; ordinary field labour at other seasons partly in money and partly in kind. The hired labourer working near his own village is able to subsist in ordinary years on the wages he receives for his labour; but it is a bare subsistence, and little else; for purchase of clothes, for a wedding, or funeral, or any other similar expenses, he has generally to borrow either from his landlord or employer, or from the village mahajun. He is in a chronic state of poverty and indebtedness, and in many parts of Bengal is little better than a slave attached to the land on which he squats. For skilled labour the rates are generally at least double those paid for field labour, and such labourers as are willing to work away from their houses on public works earn very considerable sums.

ENTRAL
ROVINCES.

Nicholls.

CENTRAL PROVINCES.

Saugor, Major Bloomfield.—An agricultural servant engaged for the 12 months is paid :—

Rs. 2 per mensem = 24 Rs. per year.
1 blanket, value Rs. 1,—in the rains.
1 quilted jacket, value Rs. 1 to 0–12–0,—in the cold weather.
2 pairs of shoes, value 0–6–0 to 1–0–0,—in the year.
2 rotis, made of $\frac{1}{4}$ to $\frac{1}{2}$ seer of flour,—every day. Flour is generally $\frac{1}{2}$ anna per seer, so this would cost $\frac{1}{8}$ anna daily, or from 365/8 ÷ 16 = Rs. 2–8–0 to say Rs. 5–0–0 a year.

At sowing time $2\frac{1}{2}$ seers of the grain sown. At harvest one bundle of grain, with straw (about $2\frac{1}{2}$ seers of grain), every day during the harvest.

Women employed on daily wages earn about 2 sheaves of grain (value about 2 annas) daily, or about 2 × 30/16 = Rs. 3–12–0 per mensem in the harvest time.

Piece work (called kutha) is given at harvest time, the reaper being given one bundle in every 20 cut, or 5 per cent. In this way a man can earn four bundles, value about 1 anna each, or 4 annas to 6 annas a day.

At Chilora, 10 miles from Saugor, the people are said to get $2\frac{1}{2}$ to 3 Rs. per month, but everything else the same.

At Baroda, 14 miles east of Saugor, they receive Rs. 2 to 2–8–3 per mensem, with miscellaneous articles, as above.

At Bali, 12 miles east of Rahli, if employed for a short time, they get Rs. 3 per mensem, or for all the year round 30 seers of wheat (value 1–4–0) and 30 seers gram (1–0–0) or Rs. 2–4–0 per mensem, besides the miscellaneous articles mentioned above.

It appears that much of the farm labour in Bilaspur is performed by partnership arrangements.

One way is where the labourer gets after harvest one quarter of the total produce. In other cases he has assigned to him about an acre or an acre and half of land, for which the employer pays the rent, and on which the labourer works in his spare time. Apparently he works two days on the employer's land, and on the third day, using his master's cattle, on his own patch of ground. He can get money advances without interest, but for grain lent to him he repays with sawai in kind. The wages of a woman or boy, paid in grain, is equal to 3 pice to 6 pice, according as grain is selling cheap or dear. The quantity does not vary, being two seers of unhusked rice a day.*

Raipur.†—The purely labouring classes in the district form a very small minority of the population, as almost all have some small plot of their own, which they cultivate with their own or hired bullocks. At the head of the labouring classes stand the ploughmen, who receive as wages one quarter of the crop they plough. This high rate of payment was fixed in times long past, when grain was much cheaper than at present, and is retained now owing to the continual advance of this class to independence. As soon as they scrape together enough money to buy a pair of bullocks they set up on their own account, and this constant upward movement keeps up the rate of wages, though grain is now nearly 12 times dearer than it was 20 years ago. In former days almost every ryot who owned four bullocks kept his ploughman, but of late years their services have become two costly a luxury for any except rich ryots and Malguzars.

The rest of the labouring classes consist of those who depend upon occasional jobs, and are called locally "bhootiar." When employed on farm work they are paid as follows :—

For weeding—one kata of paddy daily = $3\frac{1}{2}$ seers.
For cutting—two katas do.
For treading out—two katas do.

Rice huskers and owners of oil presses are not paid wages, but do the work by contract, the rice husker giving eight katas of husked rice (chawal) for 20 katas of paddy, and the oil pressers giving oil in the following proportions :—

One seer of oil for five seers of linseed.
One " of " for four " tilli.
One " of " for four " castor oil.

One seer of seed, or about 20 per cent., being supposed to be his profit, the same as is given to the rice husker.

Rate for the chief kinds of labour.—The wage of domestic servants have increased greatly of late years. In 1861 Tahsil chaprassis got 3 Rs. in cash a month, a good syce could be got for that monthly wage*; a day coolie got $1\frac{1}{2}$ anna, a woman 1 anna.

Tahsil chaprassis now get from 5 to 6 rupees, with compensation for exceptional dearness of grain, and an expectation of pension, and fitting men could not be obtained for less. A good syce can now hardly be got for Rs. 6 a month.

The following rates are now paid in the Ramtek pán gardens for occasional help: a man $2\frac{1}{2}$ to 3 annas, a woman 2 annas, a child $\frac{1}{2}$ anna; where the engagement is for the month a man gets from 4 to 5 rupees a month, varying with his capabilities, a woman or a middling sized boy 2 annas.

Hamals engaged in loading railway waggons when in steady employ get Rs. 7 a month, but generally hey work in gangs on contract work, and can earn up to Rs. 12 a month, and in times of pressure more than double this amount.

Ordinary village carpenters, masons, and smiths earn in Nimar Rs. 20 a month, in Nagpur and Wardha 15 rupees, and 15 also in Chhindwara, Jubbulpore, Hoshangabad, and Sironcha; while in Bhandara, Chanda, Seoni, and Mandla Rs. 12 is the ordinary rate. In Saugor and Damoh their earnings are from 8 to 9, and this is about the rate for Chhattisgarh.

---

* NOTE.—My informant is Bechi Lal, late forest darogah of Bilaspur, an intelligent man, who had been very many years in the district, now a darogah in the Excise Department. I have also my own recollections and the Raipur Settlement Report to corroborate.

† From Mr. Hewitt's Settlement Report, 1869.

* NOTE.—Wheat was then selling at Jubbulpore at 64 seers rice from 32 to 48 seers, for a rupee.

CHAP. I. QN.

CENTRAL PROVINCES.

Mr. Nichol.

The wages paid for unskilled labour in the Empress Spinning and Weaving Mills at Nagpur are—

Able-bodied men - -	6 to 9 rupees a month.
Women - - -	3 to 5 „ „
Boys (who do most of the work)	4 to 5 „ „

There are still very few of the Koshti (the weaving class) who came for employment at these mills.

Skilled hired servants working for the native cotton weavers (koshtis) in the towns of the Nagpur district earn from Rs. 6 downwards. As a rule, these men have served an apprenticeship.

The servants of mahajans, who run errands and do the work of dunning, get Rs. 4 a month and perquisites. Their stipulated wages have doubled within the last 15 years.

I am fully satisfied that the rise of wages has been general, and has been continuous since 1862. The increase has been fully 33 per cent. for agricultural labour.

I think it may be said that a steady villager of good character and some knowledge of farm work, and in good health, need not be without employment at any time of the year. And there is always spinning, cotton cleaning, husking rice, and cleaning grain open to their wives and children; and for themselves thatching, rope making, repairs to houses, and agricultural plant are generally available.

I will calculate the earnings of a village labourer, who is not in very favourable circumstances for saving, that is, one who has only one boy able to work and only one girl, but I will suppose they enjoy fair health.

—	Seers.	—		
		Rs.	a.	p.
The husband; 60 seers × 12 months - - - - - -	720			
perquisites - - - - - - - -	38			
cash - - - - - - - -	„	2	0	0
The wife; weeding, harvesting, &c., 3½ months - - - -	„	10	8	0
spinning, &c. - - - - - - - -	„	8	0	0
A boy of 12 years; 38 seers, say, 10 months - - - - -	380			
A girl of 9 years; harvesting and weeding, 3½ months - - -	„	5	4	0
Gleaning and grass cutting, &c., of the wife, boy, and girl - - -	„	1	0	0
Total earnings Seers	1,138	26	12	0
Consumption of grain by family under - - - - - -	800			
* Balance at least 8½ maunds - - - - - - - -		20	0	0
Total - - -		46	12	0
Expenditure in cash, clothing at Rs. 6 a head - - - - -		24	0	0
Condiments, salt, oil, &c. - - - - - - -		12	0	0
Savings - - - - - - -	Rs.	10	12	0

* Valued at present high rates. For the balance they could obtain very nearly retail rates.

This surplus of Rs. 10–12–0 would be much reduced when their surplus grain has to be sold at much lower rates. It is therefore quite clear that the hired labourer paid in grain (so long as work is available), is better off when prices are high than at other times, and while he profits by high prices the man paid in cash must suffer.

In villages near jungle tracts wages will probably be lower than I have assumed, but here he is, I think, more than compensated by the mhowa and wild fruits picked up at no appreciable cost by the members of his family. Mhowa will, I think, replace double its weight of grain, on alternate days for four or perhaps five months of the year.

From this margin of Rs. 10–12–0, or less, he can provide something for sickness, or for holidays. He will have in course of time to marry the boy and also the girl. This will cost him about Rs. 12–0–0 on each occasion. With more boys, with fair luck and health, with steadiness and frugality, he ought in the course of six years to be able to raise himself to the position of a cultivator, and any malguzar, whether resident or non-resident, would prefer such a man as a tenant (rather than an embarrassed man born in the grade of cultivators), and the malguzar would be glad to give him a helping hand.

Almost always when a steady village labourer engaged by the year is in want of temporary help, he can obtain an advance of a few ruprees from his employer without interest. The amount of indebtedness of the whole class to their employers is in ordinary times quite insignificant, and they clear themselves at harvest time. They are also, I may say, free of debts to the Banias. I consider then that the hired agricultural labourer is usually able to subsist with fair ease on his earnings. But there is always the fear of a long and incapacitating illness hanging over a family. Even in this respect there has been, I am everywhere assured, a marked improvement of late years; I am told that there are more old people to be seen, and long fevers preventing labourers from earning their living are much less common.

Wardha, Mr. Bapu Rao.—Men only are employed as farm labourers by the year. They get from 40 to 50 seers of jowari a month, and a single cash payment from 1 to 4 rupees. Sometimes a blanket and a pair of shoes also are given.

If it be stipulated that wages are to be paid in cash, he will get from 32 to 35 rupees in the year. Servants are fed on three holidays in the year, or else get a present of 5 seers of jowari and wheat.

At harvest time they get a present from the new grain from 10 to 30 seers of jowari. The servant is shaved at the master's expense.

The barber gets from 12 to 25 seers on each plough, and shaves all the male members, servants, and visitors of the cultivator.

The smith and carpenter get double of what the barber is paid, and does all the work required by the cultivator in respect of his agricultural tools and plant.

The Patwari and Astrologer get their trifles in kind at the harvest.

AP.I. QN. 15.

CENTRAL
ROVINCES.

WARDHA.

r. Bapu Rao.

Mr. Laari.

The following rates are paid to hired field labourers :—

	Men.	Women.
1. Removal of old stalks of jowari and cotton from dry fields.	Not employed. If any work willingly, the same rate is paid as for woman.	1 anna per diem.
2. Assisting the ploughman in sowing.	Not employed - - -	1 anna per diem.
3. Weeding - - -	Not employed - - -	From 3 pice to 5 pice, *i.e.*, from ¾ of an anna to 1¼ anna.
4. Picking up cotton at the first and second picking.	Twelfth part of the cotton picked, which is from 2 to 3 seers per diem; and half for the third picking, which gives from 1 to 1½ seer per diem.	Same as for men.
5. Cutting jowari plants - -	5 seers of jowari per diem - -	Not employed.
6. Binding sheaves of plants -	Do. Do. - -	Do.
7. Cutting ears of jowari from stalks.	Ears sufficient to yield about 5 seers of jowari per diem.	Ears sufficient to yield about 2½ to 3 seers of jowar per diem.
8. Threshing - - -	5 seers of jowari per diem - -	Not employed.
9. Reaping wheat - -	Same as No. 1. - - -	2½ seers of wheat per diem.
10. Do. linseed - -	Do. - - - -	1 anna per diem.

If any man does not get employed by the year, then he works by the day. Such a man and his wife earn about as follows during the year :—

	Cash.	Grain worth	Total.	Annual Expenditure in living.	Balance.
Men - - - -	Rs. 4	Rs. 28	Rs. 32	Rs. 32	—
Women - - - -	Rs. 10	Rs. 6	Rs. 16	Rs. 16	—
				48	

This is the average income of a village labourer. But should he and his wife be specially strong and industrious, they get much larger wages, and by frugal living save sufficient in a few years to buy a pair of bullocks to start cultivation. The average income which a labourer gets is generally sufficient for his wants, but he has often to borrow money or grain for his maintenance at times when he finds no employment for a considerable period. Instances are known of labourers being in distress, but generally they get enough to live on.

Wardha, Mr. Laurie.—Hired field labour is of several kinds. Mr. Elliot in his Hoshangabad Settlement Report has given a convenient summary of the services in agriculture which are performed by wages-paid labourers, and I will follow his enumeration as far as it is applicable to this district. Without dissertation of any kind, I put in tabular form the information I have gained from consulting Malguzars of all parts of the district on the rates of wages and the method of payment, so as to reply to queries (1), (2), and (3) of this group.

Labourer.	Wages.	Remarks.
1. Ploughman (regular, *i.e.*, employed all the year round).	60 to 70 seers of jowari *per mensem*, now worth from Rs. 3 to Rs. 3-8-0.	He also often gets a pair of shoes and a *kamal* or blanket as perquisites. When not ploughing he is employed in *rakhwali* and other jobs.
2. Ploughman (occasionally employed by the day for some special work).	2½ to 3¾ seers of jowari a day, now equal to from 2 to 3 annas a day.	
3. Sowing, *i.e.*, feeding the drill.	5 to 6 pices a day - - -	Usually work for women.
4. Weeding—		
(*a.*) Men - -	1½ to 2 annas a day - -	The rate varies according to the supply of labour. The payment is made daily for such as are very needy; for those who can afford to wait it is made weekly. The demand for pice at the beginning of the weeding season sometimes causes the coin to sell at a premium of a pice or more in the rupee with the local money-changers.
(*b.*) Women -	3 to 4 pices a day.	
5. Stubbing (*i.e.*, clearing ground of roots, &c.) *In Arvi.*	1 rupee for 20 cubits of land stubbed in Arvi. This work is done elsewhere with the plough.

Centr
Provinc

Bhargo R

Mr. Imr

Labourer.	Wages.	Remarks.
6. Watching - - (*Rakhwali.*)	60 seers a month for two months, or 2 seers a day. When on daily rates $3\frac{3}{4}$ seers a day.	Usually the ploughman is employed.
7. Reaping—		
(*a.*) for jowari -	$3\frac{3}{4}$ to $5\frac{1}{2}$ seers of jowari a day=$2\frac{1}{2}$ to 4 annas a day.	
(*b.*) for wheat -	One out of every 20 "pendies" or big sheaves of wheat cut, *i.e.*, 5 per cent, of the amount cut by the reaper. A man is generally able to cut 20 pendies in a day.	
(*c.*) for tilli -	Daily labour rate.	
8. Winnowing - -	$3\frac{3}{4}$ seers a day - - -	Work generally done by the cultivator and his regular servants.
9. Cutting hay - -	From 10 or 12 annas to 1 rupee the 1,000 pullas.*	$3\frac{3}{4}$ to 5 seers of jowari is thus the average daily wage that is paid in kind. Most hired field labourers are thus paid, weeding alone demanding the use of coin, as the work does not itself bring in anything immediately useful. As the food of a man in full work is only a $1\frac{1}{4}$ seer, there is a possibility of laying by two or three days' food for every day of work. If the harvesting periods (at both seasons) do not extend beyond three months, a man could even thus subsist himself in the slack time. But he has generally children to maintain, and there are other needs to supply, so that he † probably gets into debt, if any one is rash enough to lend to him. The fact that weeding is paid *weekly* shows that the weeders have something on hand to help them going at first.
10. Picking cotton -	$\frac{1}{12}$th or $\frac{1}{10}$th of the quantity picked; generally amounts to $1\frac{1}{2}$ to 2 annas worth of cotton a day.	
11. Picking gram -	1 pendy out of every 20 picked. A man can pick in a day 40 or 50 pendies. The pendy holds $2\frac{1}{2}$ to $3\frac{3}{4}$ seers.	
12. Gathering alsi -	Pendy rate about $3\frac{3}{4}$ seers a day can be thus earned.	
13. Herdsman - -	60 seers a month if a regular servant; occasionally employed men get 4 pices or 1 anna per head of cattle per mensem in the district; at head-quarters much more.	

Narsinghpur, Mr. Bhargo Rao.—Permanent servants engaged all the year round are employed in ploughing, sowing, cutting the crops, watching the fields, and doing all the business which a cultivator would do himself if he had no servant.

Servants employed to watch the fields are often employed for six months, or for two or three months at the lowest at a time, as their services may be required.

Additional labourers employed for cutting the harvest are paid at daily or contract rates.

Additional labourers are also employed in ploughing and sowing. These are not employed for longer periods than a month at the most.

For permanent servants the wages in this district are either paid in grain or in money. Ordinarily the wage is equal to Rs. 2 a month; sometimes the rate varies from 2 to 3 rupees, but these rates are for ordinary years. This year they have risen to Rs. 4 per month, as grain now sells at greatly enhanced rates. When wages are paid in kind the usual rate is 16 maunds of wheat and gram in equal proportion for the year.* In addition to this a permanent servant gets a pair of shoes, one blanket, and at the time of sowing and reaping a small quantity of grain; not more than a rupee's worth altogether is given to him.

Watching of the fields is often given on contract; two or three neighbouring cultivators join together and engage a servant on a salary of Rs. 2 to Rs. 3 per month. When payment is made in kind a labourer gets on an average one seer and a half per day. If they are employed for six months the wages are eight maunds of wheat and gram, besides a blanket and a pair of shoes, and a small quantity of grain at the time of harvest.

Servants employed in ploughing and sowing get from Rs. 3 to Rs. 4 per month, or at a daily rate of $1\frac{1}{2}$ annas to 2 annas. Persons employed at the time of cutting are paid the daily rate above mentioned, or they are paid according to the quantity of work done, *i.e.*, one bundle for every 20 cut by them. Cutting is also given on contract, and this plan is generally preferred.

The labourers, as I have said above, are paid in cash and also in kind. The payment one way or the other is fixed with the consent of the contracting parties.

The labourer generally gets enough to live on, but he is seldom without a family of children, and his earnings are not enough for the family; but his wife and child, if grown up, assist him, and they earn a part of their living. Men who are not employed all the year round by one master need not be idle for the rest of the year; as soon as the ploughing and sowing operations are over, weeding follows; preparations are made for cutting the autumn harvest; then follows watching and cutting of the rabi crops. When cultivators are at leisure, if they have the means, they employ labourers in embanking their fields. It is only in cases where a labourer has a family and small children that he is obliged to borrow, and in such a case his condition is very hard.

Saugor, Mr. Imrie.—Hired field labourers are paid according as their labour is given in the weeding, the grass-cutting, and the harvest season. Ploughing and sowing are done by the members of the family or by house servants, the latter receiving Rs. 2-8-0 or Rs. 3 a month; or in some cases $2\frac{1}{2}$ seers grain a day.

The ploughing and sowing are soon over after the first burst of the rains. The weeding season extends over four months, but only two months' full labour is expended. At that time the hired labourer is paid in kind, except in some villages near Saugor, or one of the larger towns. There the market price of labour,

---

* The pulla of Wardha is about equal to three of the ordinary pullas of the Nagpur district.—G. J. N.

† But there is no necessity for his idling during the rest of the year.—G. J. N.

* This amounts to $3\frac{1}{5}$th kandies of wheat and gram, and compares favourably with the 4 kandies of jowari earned by the ploughman in the Nagpur district.

AP.I.QN.15.

CENTRAL ROVINCES.

say, 6 pice a day, is given, but all my informants state that even near Saugor it is rare to pay wages for weeding, save in kind. The amount given varies from ($1\frac{1}{4}$ to $1\frac{7}{8}$ seers) $2\frac{1}{2}$ measures of kodo and kutki being held equivalent to $1\frac{1}{2}$ wheat. Apparently $1\frac{7}{8}$ seers is the general rate, except at a distance from Saugor, where $1\frac{1}{4}$ seer is more commonly given.

Then for cutting grass. This is almost everywhere paid for in money at 1 per 4,000 pulas and at 5,000 when the money is advanced, or in distant tracts 5,000 pulas. In one of the villages payment is made in kind at $2\frac{1}{2}$ seers a 1,000. Grass is cut in December and the months before and after.

Then at the wheat harvest payment is rarely made in money. Payment is almost always in kind, by the armful of crop cut. The usual rate is one pur (armful) for the working day, *i.e.*, from 11 o'clock till evening: or 2 purs from morning till evening. The sheaf-binders get double of this, as their labour requires more skill. Ploughs are driven by members of the family or house servants. In a good harvest year almost double is given, and some Malguzars say they sometimes give treble.* From one pur $1\frac{5}{8}$ seers generally is threshed out; but sometimes $3\frac{3}{4}$ seers of grain.

For the cotton picking the rates are those for weeding; and for the jowari and rice harvests as for the rabi.

House servants get a blanket as the rains set in, and one or two pairs of shoes in the year.

The average hired labourer of the average village finds work in the village for almost the whole year, only between the harvests, when, however, he may be guarding the crop; and in the hot season his labour is dispensed with. And taking the number of labourers' houses in a village as generally equal to that of cultivators, I think a labourer with a small family dependent on him is quite able to subsist on his gains in those intervals. In harvest time he obtains as much grain a day as will last him three, and at other times not much less. Of course, if he has a large family solely dependent on his labour, or any unusual expenses, like a marriage, he must incur debt. And I am told by all I have asked on the subject that not 10 per cent. of the labouring population are out of debt, while very few are in debt over 10. This explains itself. The labourer has no landed interests in the village, neither profits to toil for nor security to give.

But though in debt, I do not imagine that, receiving wages as he does in kind, the cultivator ever curtails his allotment; and while there is work for him, and the grain he gets can feed his family and more, the labourer is safe.

The problem is, however, complicated by the fact that at harvest time only half the labourers employed belong to the village, and of the other half perhaps half do not belong to the district. My information allows me to state generally that in March numbers, amounting to one-fourth of the labourers actually employed, come from the surrounding districts, particularly Tehri, where it is said the insecurity of tenures permits of little outlay on the fields. And as many labourers as come from foreign territory do not belong to the village of which the crops are being reaped, though they belong to other parts of the Saugor district, these therefore share in the harvests of at least two villages.

I am of opinion on the whole that in ordinary years the labourer is able to subsist with fair ease on his payments in the harvest and other seasons. As to those who come from other districts, I know nothing; but I am told that they take back enough grain with them for their own wants.

Many labourers are of course compelled to borrow. If 90 per cent. be in debt, then I presume 90 per cent. have to borrow. But this indebtedness is what they cannot help, and is rarely very deep. It is a condition they tend to; it simply means that they have nothing to spend in luxuries, and that does them little harm. Where there is work, there they have subsistence, which enable them to weather the year with fair ease. If they have children to support and many, the evil cures itself as these grow up."

Seoni, Mr. Wasadeo Bullal Kher.—Hired field labourers are of the following descriptions:—

The Barasiya,—employed by the year. He is required to do any work which the employer may point out to him in respect of cultivation. The whole of his time and skill are at the disposal of the employer. The annual wage varies from 6 to 3 khandis or 2 to 1 seer per day.

The Pakhiar,—employed by the fortnight, must work in the same way as the Barasiya, and may be retained or discharged as each fortnight is completed. The wage is 4 kurus for two weeks, or 2 seers per day.

Harwaha,—ploughman,—is employed for the whole year. But he will only drive the plough, bring in grass for thatching the house, and will fence and hedge the Bari, &c. He will not do anything else. He* receives $\frac{1}{5}$th share of the profits in grain crops, $\frac{1}{32}$nd of gur, half the share of cotton, and this way the individual ploughmen get different shares in different kinds of crop.

Bardia,—Cowherd—grazer of cattle, exclusive of plough bullocks. He takes† 4 kurus per cow=28 seers, 8 kurus per buffalo, 56 seers.

Charwaha—grazer of plough bullocks,—takes $1\frac{1}{2}$ khandis per annum. This man must graze the bullocks without taking them at a distance from the fields to be ploughed. He must take charge of the bullocks as they are disengaged from the yoke in rotation, and bring fresh pairs to the yoke. Generally a boy does this work.

The Banihars,—the day labourer, employed occasionally on work which the standing servants or home labourers could not accomplish, as for instance, in cutting the crops, gleaning, weeding, transplanting rice crops, &c. The daily wage is not less than 2 seers, whether for man or woman.

All these labourers receive their wages in kind. The rate does not vary with the market prices of the grain.

The permanent servant adds to his own wages those of his wife and such of the children as can do field work, so that, unless the unproductive members of his family are not too many, or unless he is kept at home by sickness for some time, he ought, and I believe does, subsist with fair ease on his and his wife's earnings. Any disturbance of these conditions tends to drive him to borrow, and the debt may grow faster than he can manage to pay off. Instances are by no means rare of a cultivator's servants being compelled to steal the grain of his employer, because having already spent his advances of grain, the master will not advance any more.

The day labourers generally remain pretty well occupied for about 5 months of the year; $2\frac{1}{2}$ months in cutting and gathering the crops of both seasons; $\frac{1}{2}$ month in cleaning; 2 months in weeding, transplanting, &c.; total, 5 months.

And as the daily wage of these is 2 seers=to the average requirements in food grains of 3 to 4 souls, it may be assumed that the savings of the working season should suffice for the food requirements of one or two souls; the other necessaries of life, such as clothing, &c., are easily procurable by the proceeds of other labour which is available during the remaining months of the year. Bringing in fuel, grass and other jungle produce to the market for sale or collect-

---

* I imagine this can only be when the Bundelkhand labourers are fewer than usual, and when the weather appears to be threatening.—G. J. N.

* No doubt this must be limited to the produce only of such land as the individual ploughman has been employed, or the $\frac{1}{5}$th will be divided among all the ploughmen of the same employer.

† This can hardly be the rate in villages, probably only what is paid at the head-quarter of the district.—G. J. N.

Central Provinces.

ing mhowa for its owner, are the principal kinds of additional work which might be performed during the intervals of field work. In many cases spinning and weaving the roughest country cloth is followed when field labour is slack. On the whole, this last class of hired workmen seem to do well. They often are able to lay by savings, and when they accumulate, can provide the means of starting themselves as independent cultivators. It not unfrequently happens that a broken ryot, when he sees no chance of raising his head above his debts, or can no longer bear the losses of bad years, looks forward to the life of a day labourer or permanent field servant, in order to secure that relief which his improvident management of the land prevented him from achieving. This would prove that the labourers are more successful in their aims than the general run of cultivators.

BERAR.

Berar.

Mr. Dunlop

Lieut.-Col. Menzies.

Akola District.—Women are paid from 1 to 2 annas and men from 2 to 4 annas per diem for weeding, &c. The rate varies according to the demand for field labour. Hindustani labourers are often employed by the year or month at wages of about Rs. 2 per mensem, with their food.

Labour in harvest operations is paid for in kind. For the first picking of cotton $\frac{1}{10}$ is given; for the second picking, $\frac{1}{8}$, and for the third picking about $\frac{1}{2}$.

For harvesting joár a basketful of heads of grain.

Ellichpur.—Women from 1 to 2 annas, men from 2 to 4 annas. Plough with three pairs of bullocks and four men, Rs. 2. Harrow with one pair of bullocks and one man, 12 annas at harvest.

From $\frac{1}{10}$ to $\frac{1}{18}$ part of the first picking of cotton. For the second, third, and fourth pickings the rates are increased respectively to $\frac{1}{8}$, $\frac{1}{6}$, $\frac{1}{2}$ of the quantity of cotton picked.

For collecting ears of joár a quantity of ears equal to eight seers of joár. For collecting ears of wheat half the quantity of seed sown in the whole field on contract, or five bundles per 100 bundles harvested.

Amraoti, Lieut.-Col. Menzies.—Hired field labourers are paid from 1 to 3 annas per diem; the payment is very frequently made in kind. Weeding costs an anna, harrowing 2 annas, ploughing $2\frac{1}{2}$ annas to 3 annas per diem per man employed. Hire of plough bullocks amounts to from 8 to 12 annas per diem.

Wun, Major Szczepanski.—Field labourers are of two classes:—1st. Those employed as servants for looking after the cultivation of the land, and other ordinary field work, and who are generally engaged by the year, and are paid partly in cash and partly in grain, the ordinary wages being Rs. 20 per annum and 24 maunds (864 seers) of grain. 2nd. Those engaged by the day during crop and harvest season for weeding fields and such like work. Both men and women are employed at these times. The wages vary according to the season. Thus at sowing time a man gets 5 annas and a woman 2 annas a day. At weeding season a man gets 3 annas and a woman $1\frac{1}{2}$ annas a day. At present the payment is made in grain. A man getting 9 seers a day is equal to about 8 annas to the man and 4 annas to the woman.

The hired labourer would generally forestall future payments if it were in his power to do so, but having no security to offer, his credit is very limited, and this prevents his running much into debt.

The payments he receives for field work are not sufficient to keep himself and family throughout the whole year, but during the intervals of non-employment he can generally find some other work.

Amraoti, Lieut.-Col. Menzies.—The hired labourer has rather a rough time of it on his small wages, but many of them are men from the North-West and Oudh, and these men positively save. Wages are constantly forestalled, and the labourer at the end of the season finds himself in debt to his employer, and has to bind himself to serve for some time on nominal wages, *plus* his food, to pay off his debt.

Ellichpur, Major Mackenzie.—The hired labourer is not usually able to subsist on the grain or other payments he receives. He does not, however, borrow or forestall future payments, but seeks other employment, or subsists by fuel or grass, which he brings from the forest for sale.

Wun, Major Szczepanski.—The hired labourer is obliged to borrow, as it is rare for him to save anything out of his daily wages.

BOMBAY.

Bombay

Mr. Pei

Kaira.—Hired field labourers get 2 annas a day, besides bread $\frac{1}{2}$ lb. and dhal $\frac{1}{2}$ lb. In the busy season ploughmen get 4 annas, and weavers—men 3 annas, women 2 annas, children $1\frac{1}{2}$ annas, all with one meal a day.*

Wages of labour are—

	Per Day.
Blacksmith	8 annas.
Carpenter	8 „
Sawyer	8 „
Mochi	8 „
Bricklayer	6 „
Tailor	5 „
Weaver	5 „
Mill hands—	
Men	4 „
Women	2 „

The hired field labourer always has to live from hand to mouth in the hot season between employments. He borrows all he can get and forestalls all he can.

Surat.—Field labourers get (in coin), men 3 annas, women $2\frac{1}{2}$ annas. They have no credit to borrow.

Thana.—Field labourers get from 2 to 4 annas a day, or from $2\frac{1}{3}$ to $4\frac{2}{3}$ lbs. of grain. These wages do not suffice to feed the labourer in the slack season; he then borrows.

Colaba.—Field labourers get from 2 to 3 annas in corn. They subsist in the slack time by cutting firewood and odd work.

Khandesh.—Permanent labourers are paid Rs. 40 o 60 a year, with two pairs of shoes and one blanket. They are paid monthly or quarterly, and usually in advance. Temporary hands get, men $2\frac{1}{2}$ to 3 annas a day, women 1 to $1\frac{1}{2}$ annas. Harvest work is paid partly in money and partly in grain, as a rule daily. The labourer is able to subsist in the slack time on what he makes in the busy season.

Poona.—Wages vary. Field labourers sometimes get 2 annas a day and their food. Mhars when threshing get 3 lbs. of grain. Permanent labourers get their food and Rs. 10 to 20 at the Dewali. The wage suffices for a labourer's wants.

---

* See for general table, Administration Report of Bombay, Appendix B. (10), Prices of Labour.

AP. I. QN. 15.

BOMBAY.

Mr. Peile.

Kaladgi.—Field labourers are generally paid in kind, 3 Bengal seers per man, 1½ per woman, 1 per boy or girl above 7. For sowing, which is in some sense skilled labour, 4 seers are given. Similarly for reaping 5 or 6 seers, and women 2½ to 3. For harvesting 4 seers and 2. If cash is given, it is the value of the grain at current rates. Cotton picking is paid in kind. In ordinary years the wages earned in busy times carry the labourer over the slack season, and he is fairly well off. The women also make something by spinning.

Canara.—Field labourers get from 3 to 6 annas per diem, generally in kind. A carpenter earns from 6 annas to 1 rupee, blacksmith 8 annas to 1 rupee. The labourers generally borrow in anticipation of the grain they receive at harvest time.

Ratnagiri.—Field labourers are paid, males from 2 to 2½ annas per diem, females about 2 annas. They are paid mostly in kind on the Syhadri slopes, and partly in cash, partly in kind, towards the coast.

As one approaches the coast the rate of wage increases up to 3 annas for males.

Road labourers are paid not less than 3 annas.

Selected road labourers receive from 3 to 4½ annas. Skilled labour, carpenters, blacksmiths, and the like, from 8 to 12 annas.

At the end of May and beginning of June many of the absentees return, and then, notwithstanding the little hoards they may have accumulated, every labouring family on the slopes of the Syhadris is terribly pinched, and lives partly on roots (such as the root of the wild plantain) mixed with coarse grain until the "halway" or early warkas crop is ready.

Throughout the zilla the ryot habitually forestalls his coming harvest by borrowing grain from the khote or grain dealer on the "sawai" system, that is to say, an additional payment of one-fourth the grain borrowed, to be paid back at the next harvest.

MADRAS.

e Board of Revenue.

MADRAS.

In the accompanying statement the rates of wages usually paid in each district for the chief kinds of labour are shown in a tabular form.

Agricultural labourers are as a rule paid in kind, the rates varying in different districts and with the nature of the employment. During the harvest season, when all available hands are employed, the wages are somewhat higher than at other times. A large proportion of the agricultural labourers are permanently in the service of ryots or Mirassidars, and the wages they receive do not represent their entire emoluments. They often receive food in addition to their wages during the cultivation season; house-sites are given rent free; petty perquisites of various kinds are enjoyed; customary presents of cloths, money, &c., are given annually, and on the occasion of important family events advances of money and loans are given, without interest in some cases; and they are allowed the right of gleaning the grain left in the fields and on the threshing floor. It is therefore difficult to estimate precisely the money value of their emoluments, but it may be generally said that their condition is better than the rates of wages given in the statement would indicate, although it must at the same time be admitted that to a great extent they live from hand to mouth, and that they have no means, even by practising the most rigid economy, of accumulating any considerable savings which would enable them to tide over adverse seasons.

In the Wynad coffee plantations money wages are paid to agricultural labourers, but even there a portion of the wages is given in food grain.

The village artizans, such as the carpenter, the blacksmith, the bricklayer, &c., have in many villages maniems, or rent-free lands, or grain allowances, especially the two former, and they are bound to repair the agricultural implements of the ryots free of charge. When they do any other work they receive money wages.

The majority of the collectors who have reported on this question are of opinion that the agricultural labourer is able to subsist with fair ease in all ordinary seasons on the wages he receives for agricultural labour, supplemented by earnings on public works, &c. during the non-cultivation season, and that they are not forced to borrow or forestall future payments for subsistence, although they do so frequently, for marriages and other ceremonies. The collector of Kistna, however, expresses a decided opinion to the contrary. He states: "The permanently hired field labourer, "termed 'paleru,' is nearly always heavily indebted "for advances to his master. He is tied hand and "foot, and his condition is little better than that of a "slave. The daily labourer lives from hand to "mouth, and cannot, if he would, forestall future "payment."

The difference of opinion arises doubtless in great part from the matter being looked at from different points of view. Judged by the standard of mere subsistence, the condition of an agricultural labourer may be said to be one of fair ease in ordinary times, but that it is extremely precarious must be admitted, as adverse seasons are unfortunately by no means uncommon. The wages he receives in an ordinary season are sufficient for his subsistence, and he is not under the necessity of borrowing, unless he desires to meet extraordinary expenses, as for a marriage or other ceremony. High prices do not necessarily affect his condition to any serious extent, as he receives his wages in grain, and is thus ensured sufficient food for mere subsistence, which is all that he has been educated to care for. When, however, prices are high, as a result of failure of crop, and the employer himself becomes embarrassed, the position even of the permanent agricultural servant becomes critical. Having been unable to save anything to stand him in stead in time of need, and there being no demand for service elsewhere, he is thrown entirely on private or public charity for the means of livelihood. The above description applies, however, to the lowest class of landless labourers only, and not to persons who themselves own land and supplement the income from it by working for hire for others; nor to those who own cattle and cultivate the lands of ryots on the "warum," or sharing system, in whose condition there has been of late years a considerable visible improvement.

MYSORE.

MYSORE.

Mr. Krishnienyar.

The wages paid in the Kolar district to *jitagars* or farm servants permanently employed are partly in money and partly in raw food grain or cooked food, and they vary from Rs. 3 to 7 in cash and from 3½ kandies or 1,120 lbs. to 4½ kandies or 1,440 lbs. of food grain per annum or two meals a day if cooked food is given. The chief duties of these servants are to cultivate lands, watch and stack the crop, and attend to cattle. The labourers employed temporarily for weeding, transplanting, reaping, &c., get daily wages as given below:—

	If in Grain.		If in Cash.			
	From.	To.	From.		To.

The earnings of these labourers, when employed on fields are not sufficient for their subsistence at other periods, but they get ample employment during those periods on tanks and roads which must necessarily be maintained for them to be used.

CENTRAL INDIA.

CENTRAL INDIA.

Mr. Wingate

Wages of labour are invariably paid in kind, except in or near large towns. In this latter case Lieutenant-Colonel Bannerman thinks the cash wage is about Rs. 3 per mensem.

In *Bhopal* wages ordinarily are 2 seers of grain a day, except in harvest, when one-twentieth of the produce is given to the reapers and the right of gleaning.

In *Baghelkhand* field labourers get 2½ seers of "kodu" per diem, or when kodu is not available, 1½ seers of better grain; but ploughmen get 25 per cent. more than ordinary labourers.

In *W. Malwa* ordinary wages are 2 seers of joár, per diem, or, if in money, 1½ to 1¾ annas. For reaping 4 to 5 seers of the crop are given, or 1½ to 2 annas in money.

For *Manpur*, Pundit Suroop Narain writes:—

" Of field labourers those that are employed in ploughing get 2 to 2½ annas daily. Those employed in weeding get 1½ to 2 annas, the payment in both cases being in cash. The watchman of a field receives

IAP. I.QN.15.

CENTRAL INDIA.

Ir. Wingate.

5 seers of grain for each bigha of kharif and 5 to 7 seers per bigha for rabi crops. Labourers engaged in ploughing, &c. for a whole season get. 9 maunds of grain, a pair of shoes, and a blanket, with $1\frac{1}{4}$ seers of grain daily during the time the sowings are going on. The season in the above arrangement comprises a period of six months. Cash payment for the same work is made at the rate of $4\frac{1}{2}$ to 5 Rs. monthly. The rate of daily wage for wounding the poppy pods and for extracting the juice therefrom is, if paid in advance, $1\frac{1}{2}$ annas, and if paid at the time of work, 2 annas daily. The labourers so employed have the additional privilege of getting all the juice which may happen to run off and deposit itself on the leaves or stems of the plant. All field labourers employed by the day are at liberty to work for additional gains when off their work in the field. It is by these additional earnings that field labourers manage to make both ends of their accounts meet, and in some cases they are obliged to have recourse to borrowing or forestalling their future earnings."

IYDERABAD.

'oulvie Mahdi Ali.

HYDERABAD.

Wages vary in different districts. In the Maratha country field labourers employed throughout the year are paid from about Rs. 2-8 to Rs. 4 per month, without food being supplied to them. When food is given they are paid at the rate of about Rs. 18 per year, and they get besides annually a country blanket and a pair of shoes. A field labourer employed at harvest time generally gets from 5 to 7 per cent. of the sheaves he is able to cut and gather in a day; this may come to about $2\frac{1}{2}$ seers of grain, besides the straw. If money payments are made, a labourer gets two annas, a woman one anna, and a boy one anna per diem. Money payments are generally made when labourers are employed in weeding, &c. In Bidar and Gulbarga money payments are rare; the labourers receiving grain equivalent to the value of their wages. In the Aurangabad district (*vide* Notes on the Agriculturists, by Mr. Furdoonjee Jamsetjee), when the labourer is employed by the year, he generally receives from Rs. 12 to Rs. 30 per annum with food, or from Rs. 45 to Rs. 55 without food. In the former case he is also supplied with the following five articles of dress every year:—

		Rs.	
1 Kambli (blanket), value about	-	1	8
1 Dhoti ,,	-	1	0
1 Pair shoes ,,	-	1	0
1 Turban ,,	-	1	0
1 Waist-cloth ,,	-	0	8
Total -	-	5	0

A written agreement is generally entered into by which the labourer binds himself not to leave the service until the expiry of the term of his contract. It may be mentioned here that the labourer has generally to serve 13 months, though he is only paid for a year. The agreement is generally entered into during the months of *Chaitra* and *Vaisak*, when a part of the yearly wages is paid in advance, and the labourer draws the balance in small sums, as he may require, from time to time.

When food is given it consists of four cakes (about 2 lbs.) per day and some vegetables, or *dal*, with *chatni* or onions.

When a labourer is employed by the month a written agreement is seldom entered into, but the labourer engages to give a month's notice before leaving the service. Labourers of this class are seldom employed all the year round, but are only taken on during busy seasons. They do not generally receive food, but are paid a monthly salary, varying from Rs. 4 to Rs. 6, and have to find their own food and clothes. When the labourer receives an advance, he repays it by monthly stoppages out of his salary. When working in the fields his meals are brought to him by one of the women of his family.

Excepting when employed in harvest work, the labourer, ween engaged by the day, is generally paid in cash. He receives from two to three annas per diem, and in very busy seasons, when labour is scarce, he sometimes receives as much as four annas (6*d*.). A woman obtains from one to one and a half anna, and sometimes two annas per day. A boy has about an anna a day. Labourers engaged on daily wages are generally employed on the following work:—

Weeding.—Cash payments are generally made for this kind of work.

Harvesting.—The labourer receives five sheaves for every 100 of the crop he gathers. If it be a jowari or bajri crop, a woman is able to reap from 50 to 75 sheaves per day, and a man 100. Gram, *tur*, &c. is tied in large bundles, called *kadaps*, which vary in size, and of these also the labourer receives five per cent. When scarcity prevails and prices of grain are high, the labourers are not paid in grain, but in coin.

Cotton and ground-nut picking.—The labourer receives about $\frac{1}{14}$, $\frac{1}{16}$, or $\frac{1}{18}$ of the quantity picked in a day. During the first picking the share paid to the labourer is not so large as during the second and third pickings.

Threshing.—For separating the heads of 100 sheaves of bajri and jowari from the stalks, the labourer receives two seers of the heads of corn.

Ginning Cotton.—This labour is generally paid for in cash by marwadis, who purchase the crop, at so much for every seer of cotton ginned. The cultivator, however, gives the labourer the cotton seed in payment of the labour for ginning.

In the Telingana country labourers employed throughout the year are paid at the rate of Rs. 3 per mensem. At the *tabi* harvest each labourer gets besides a rupee worth of grain, and two rupees' worth at the *abi* harvest. Labourers who are employed throughout the year, and who are paid in kind, receive one seer of grain per diem, and at the time of the *abi* harvest they receive four maunds of grain, and at the *tabi* three maunds. Labourers employed temporarily for weeding, &c. receive three seers each of paddy per day, or one seer and a half of rice or jowari. If they are paid in coin, a man or woman receives two annas per diem, but money payments are rare. In some talukas of the Telingana country a maund and a half of grain per month is allowed to labourers employed throughout the year, and at the time of harvest they receive besides three maunds of grain and Rs. 3 in cash.

CHAPTER I.—QUESTION 16.

CHAP. I. QN. 16.

What is the normal rate of prices of each of the chief staples of food in certain typical districts? What is the usual variation between the prices at harvest time and other times of the year? What rise in price would indicate the approach of alarming scarcity? In past times of severe scarcity what effect has been produced on prices; has the rise been sudden or gradual, and has it affected one staple more than another? Or has the rise been of such a character as to tend to equalise the prices of all staples

---

PUNJAB.

PUNJAB.

Major Wace.

Prices of Food.—I take as the chief staples of food—*wheat, barley, bájra,* and *joár.* Of the total average area of annual cultivation, 211 lakhs of acres,

Wheat occupies	-	63½ lakhs.
Barley	-	17 ,,
Joár	-	22¼ ,,
Bájra	-	29 ,,

which together aggregate 63 per cent., or nearly two-thirds of the whole. And if the estimate of the food consumed in each district be compared with the statement of crops annually cultivated (both of which papers are appended to the reply to Question 3 of Chapter I.) it will be seen that there are good grounds for stating that these four cereals contribute three-fourths of the food of the population.

There is a material difficulty in stating the normal price of these staples. The truth is that there is nothing of which the value is so unsettled. To illustrate this I append two diagrams showing the prices of these and other principal articles of agricultural produce from the year 1841 to date. The prices shown therein were obtained by striking an average on the prices which annually prevailed in each district. The diagrams will show conclusively that, in the sense of prices which have usually obtained with a fair amount of steadiness over a series of years, no normal prices can be stated. To understand the existing state of prices it is necessary to consider the history of the country for the past 40 years. Up to the year 1847 the country had no roads, and little or no external trade; such trade as existed was burdened with customs and transit dues at every town, and cultivation was in a most depressed state. From the year 1849 all these conditions began to alter; roads were rapidly made throughout the country; trade was freed of all duties; the charges on the land were greatly reduced; and cultivation extended rapidly. The first result of these changes was greatly to cheapen the price of food grains. They were not acting alone, but in combination with a great number of other political and economical changes brought in with British annexation. To explain this I take the following extract from the Punjab Administration Report for the three years ending 1855–56 (para. 45.):—

"The sudden pacification of the Province after annexation, the cessation of military and political employment, which occupied many thousand of persons, and caused money to circulate in the villages induced large numbers to devote themselves to agriculture. Formerly a proportion of the agricultural classes were engaged in war and service of various kinds, and thus they supported themselves and contributed to the support of those who tilled the ground at home. But now the entire support of all these classes fell upon the land. Again, there came a cycle of seasons more favourable than the average of years under British rule. From all these causes the agriculture became unusually productive, flooded the markets with produce, and reduced prices nearly 50 per cent. This cheapness rendered it difficult for the agriculturists to obtain cash for their produce, when they wanted it to pay their new money assessments. There was less money in the Punjab than previously; large sums, which would formerly have circulated in the Punjab were remitted to other parts of the Empire by the soldiery and other Government employés. Again, the fact that nothing but cash was accepted in payment of the Government revenue, enhanced the value of money. The agriculturist, therefore, with abundance of surplus produce on his hands found difficulty in converting it into money, and this difficulty was perhaps aggravated by the unvarying nature of the Government demand (however low) with men accustomed to an annually fluctuating demand under Sikh rule."

Looking back on those years, we may perhaps not incorrectly summarise the facts of the time by saying that agriculture expanded with leaps and bounds, whereas there was no corresponding increase in other industries and in trade. And even if we could by any means have avoided levying our revenue in cash (which we certainly could not have avoided), the result on the price of agricultural produce might have been the same.

The report from which the above extract is quoted states that for 10 years preceding 1850 the price of wheat averaged 20 sers the rupee; the diagrams appended to this reply indicate a cheaper rate, perhaps 27 sers. But in 1851, owing to the causes above sketched, wheat had fallen to 42 sers; and from that time to 1859, 40 sers per rupee remained the usual value of wheat. After the famine of 1860–61, wheat in the year 1863 averaged 31 sers per rupee, joár 42 sers and barley 49 sers. But prices thenceforward rose steadily. Of this the explanation, I believe, is, that during the famine of 1860–61 the grain stocks of the Punjab, previously very full, were reduced very low by exportation towards Delhi and the Provinces to the east. The subsequent seasons were not very good; and there was a steady export toward Sind, owing to bad seasons there. The culminating point was reached in the famine of 1868–69; and prices falling immediately afterwards, continued to do so steadily, till again raised by the panic consequent on the failure of the autumn rains of 1877. They have since fallen, but as yet not to the level obtaining before the panic set in.

In the interval between the cessation of the famine of 1860–61, and the commencement of that of 1868–69, wheat after falling in 1863 to an average price of 31 sers, rose steadily; till in 1867, the year before the next famine, it averaged 22 sers. Similarly the average price of barley was 49 sers in 1863, and rose steadily to an average of 31 sers in 1867, joár in the same period rose steadily from 42 to 29 sers the rupee.

In order to examine more exactly the course of prices since the effects of the famine of 1868–69 passed off, I have compiled a statement, which will be found in the papers appended, showing for 10 districts in different parts of the Province the prices which have prevailed from April 1873 to date. These years up to the autumn of 1877 were prosperous years; and include at their commencement both the drain caused by the Bengal famine of 1873–74, and at their close that caused by the usual export trade of wheat to Europe and by the famine of 1876–77 in Southern India.

HAP.I. QN.16.

PUNJAB.

Major Wace

Taking the four years commencing April 1873 and ending March 1877, the return indicates the following as the normal price of the principal food grains for those years:—

——	Delhi.	Mooltan.	Amritsar.	Dera Ismail Khan.
Wheat - -	23	19	25	28
Barley - -	31	27	35	42
Bájra - -	25	24	26	40
Joár - -	27	25	32	43

The Mooltan prices are highest owing to the proximity of that city to Sind, and to the river export trade with that Province. The prices at Delhi, on the border of the N.-W. Provinces, though lower than those of Moolton, are higher than those prevailing at Amritsar in the centre of the Punjab. Dera Ismail Khan is an instance of a retired rural district in the west of the Province; its distance from the Sind markets exceeds that of Mooltan by barely 153 miles, and this seems scarcely adequate to maintain permanently so great a difference in prices, as the above table exhibits.

It is extremely difficult to say whether the prices of the next five years will approximate to those of the years 1873–76.

The Bengal famine of 1873–74, the famine in Southern India of 1877, and the rising export trade of wheat from the Presidency Ports to Europe, have all drawn largely on the food grains of the Province. The railway connexion of the Province is complete with Calcutta and Bombay, and now finally with Karrachi. The cost of conveying a maund of wheat by rail to Calcutta is about Rs. 1 8 0, and to Bombay Rs. 1 12 0. The distance from Amritsar to Karrachi may be roughly stated at half that from Amritsar to Calcutta. Wheat is cheap in Bombay at 12 sers, and in Karrachi at 14 sers. These are items of trade which will be in the future very closely watched by the traders of Upper India. But unless we assume as probable a very rapid growth of the wheat trade with Europe there would appear to be no very strong reason why the prices of the years 1873 to 1876 should not shortly repeat themselves.

The prices of this period correspond fairly with those indicated in the diagram appended for the period 1863 to 1867, which I have above stated, and it seems highly improbable that we shall ever return to the cheap prices which prevailed in the 10 years ending 1859; when we had no railway system, no practicable trade connexion with Eastern and Southern India, and no export of grain to Europe.

The prices of barley, bájra, and joár (though usually for barley 8 or 10 sers and for bájra and joár 5 sers cheaper than wheat) will always vary with the price of wheat. The diet of the people is not confined to one description of grain; therefore a rise in the price of one is certain to create a proportionately increased demand for the others, and so it is not possible that an excessive demand for, or failure in supply of, one grain should arise without the price of all the principal food grains being similarly affected.

I hope I have shown good grounds for my statement that there is nothing so little settled in the Punjab as the price of food grains. It has been continually changing for the past 30 years. And it is only now after the completion of railway connexion with the rest of India that we can hope to be approaching more settled prices. But this again depends on the future of India's export trade. All that is really certain is, that such extreme depressions of the value of food grains as took place after annexation are improbable in the future.

The return of prices appended does not bear out the apparent assumption that prices at harvest time will usually be cheaper than at sowing time. Other things being equal, undoubtedly prices rise at sowing time and fall at harvest time, and the farther a district is removed from the main centres and channels of trade in the Province the more these seasons will affect prices. But the state of trade and the character of the harvest are much more powerful influences. If a poor harvest succeeds a year of plenty, or if a sudden drain by export arises between sowing time and harvest, the harvest prices will be as dear or often dearer than those of the sowing season; and conversely if the harvest is plentiful, and the export demand small, the harvest prices will be lower. If the return of prices appended be examined, it well be seen that it is by no means the rule that prices are cheaper at harvest time than at sowing time.

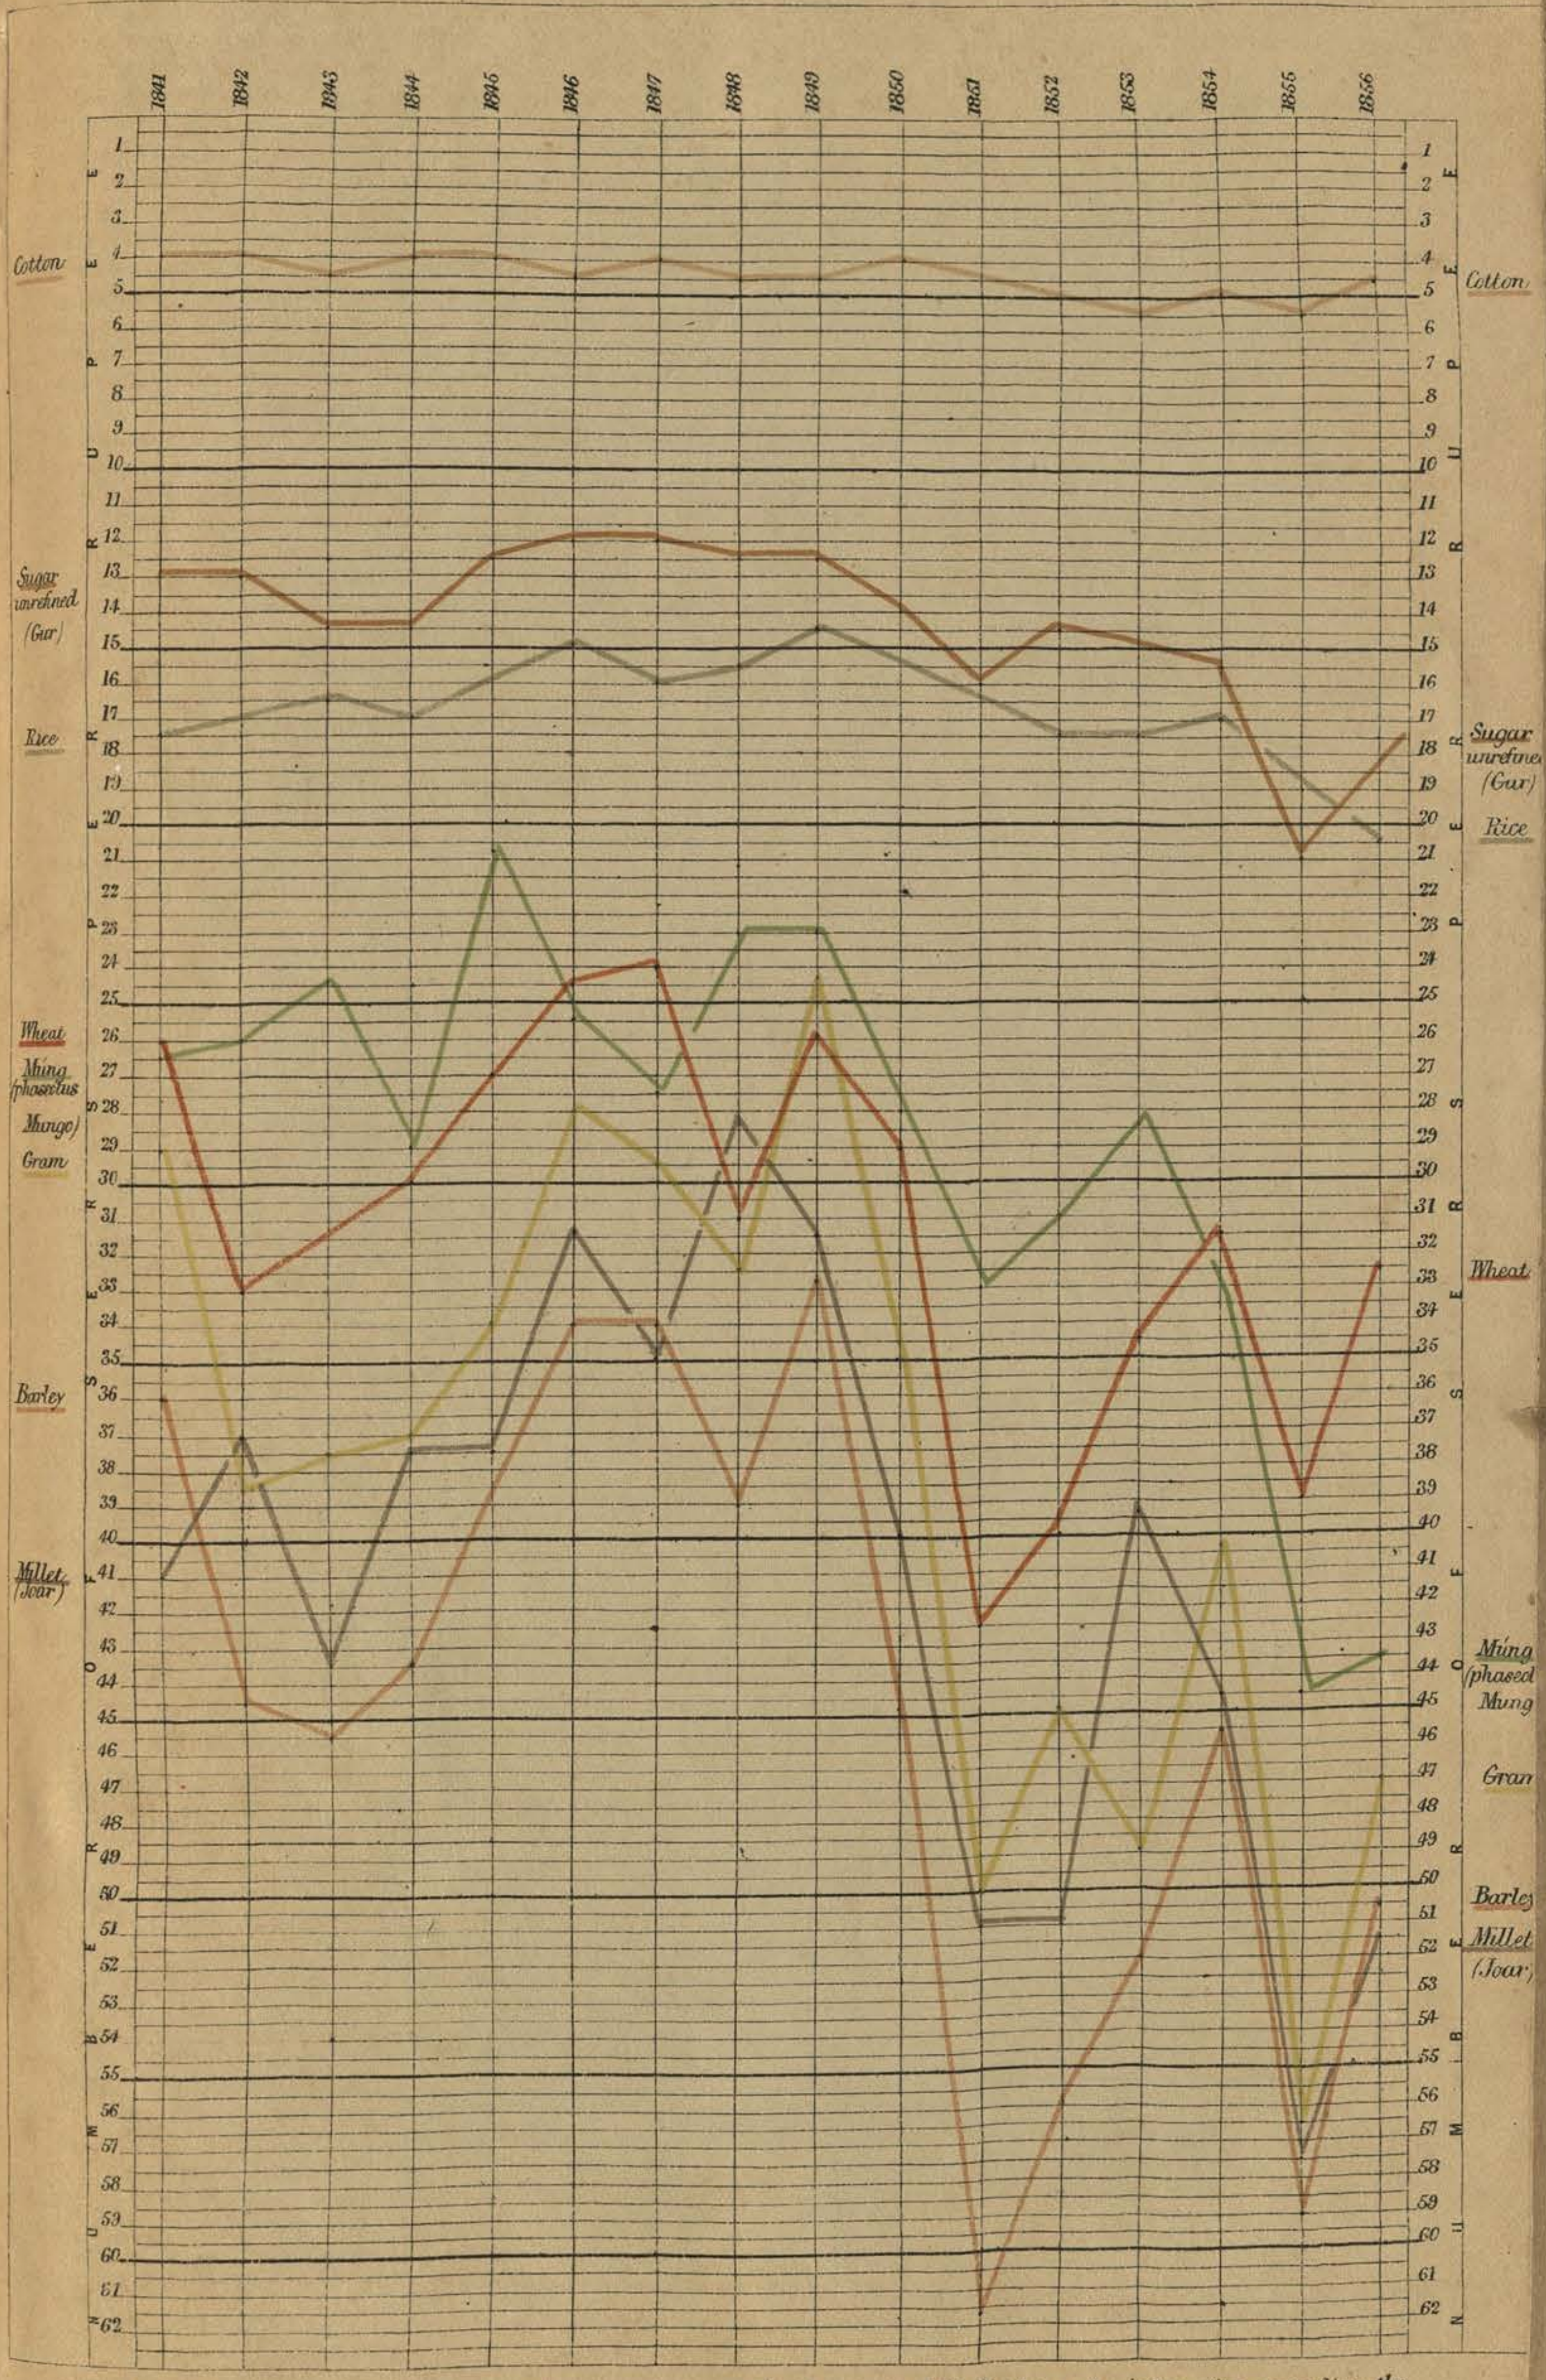
If the Punjab during the past 20 years had been free of the disturbing influences of scarcity and of new developments of export trade, it would have been possible to frame an answer to this question. But on a full consideration of the history of prices during this period as described above, I see no way of framing a reply, which would not be merely a questionable generalization. There is no district which can be said to be outside the influences of external trade.

The reply to Question 2 contains all the data needed to meet the inquiry as to the relation between prices and the approach of alarming scarcity. When scarcity is threatened, all prices rise equally in value for the reason stated a few lines above. The rises which precede periods of scarcity are usually sudden, being commonly caused by the failure of the autumn rains; a failure which in the present state of the people's knowledge it is not possible for them to foresee. In the nature of the case the rise in prices will take effect during the two months following the kharif sowing time, and will become aggravated when it is clear that not only the kharif harvest but also the rabi sowing have been lost. I am not able to quote the monthly prices of the years 1860–61 and 1868-69, but in the following table I give the extent of rise which took place in the two months of August and September 1877:—

——	Prices at Delhi.		Prices at Amritsar.	
	End of July.	End of Sept.	End of July.	End of Sept.
Wheat - -	21	12	27	14
Barley -	33	17	46	18
Joár - -	24	15	32	19
Bájra - -	21	13	25	16

When wheat rises suddenly in this way to 12 or 14 sers the rupee, and the other staples rise in price at the same time, and in the same degree, it is certain that severe scarcity is impending. Such scarcity may not follow; for instance, it did not last year; but everything depended on the rabi sowings, and at the last moment timely rain secured them. If those rains had not fallen, we should certainly have seen wheat selling by December at from 8 to 10 sers the rupee over the greater part of the Province.

DIAGRAM SHOWING THE RISE AND FALL IN PRICES OF PRINCIPAL ARTICLES OF AGRICULTURAL PRODUCE IN THE PUNJAB, FROM 1841 TO 1856.



NOTE. The prices shown in this Diagram are calculated on the averages of 16 Districts only, information regarding the remainder not being available for the years in question.

Chap. I. Qn. 16.

North-Western Provinces and Oudh.

Capt. Pitcher.

NORTH-WESTERN PROVINCES AND OUDH.

Captain Pitcher.—A table is appended giving normal prices in districts selected by the committee.

The usual variation at harvest time is that grain is one-fourth to one sixth-cheaper, judged by weight, than it is at other times, but this variation is due more to the grain containing more water when freshly garnered, and consequently weighing more than it does after lying in store for three or four months, and losing weight by the evaporation of moisture. A grain merchant when new gram comes into the market keeps up a difference of three or four seers between the old gram and the new.

As to the rise in price which indicates alarming scarcity, some officers would open relief works when grain was at 16 seers, while others would look calmly on until it rose to 10 seers; 12 seers, however, appears to the majority to be the limit, higher than which betokens scarcity. In past times of scarcity the rise has been sudden, and a bound of four seers at once in rise denotes disaster.

The effect of scarcity is to equalize all staples. When the coarse grains approximate wheat in price, and all have reached a common level of 12 seers, scarcity may be reasonably apprehended.

Table showing normal Prices of Principal Food Grains in selected Districts.

District.	Wheat.	Barley.	Juár.	Rice.	Gram.	Remarks.
Meerut	26	33	34	—	25	
Muzaffarnagar	24	37	27	15	28

BENGAL.

Ir. Toynbee.

BENGAL.

Prices.—The answer to question 16 has been exhibited in tabular form in the accompanying statement. The year 1876–77 was a fair average year, and the prices ruling during that period were fairly normal prices. The table for the year 1873–74 shows the convergence towards, that for the next year the divergence from, famine prices. The figures in column 3 of annexure II. give what may be taken as the fair average normal price for rice, the great staple article of food over all Bengal. Other averages are given in the answer to question 19. Prices usually rise at two seasons of the year; *firstly,* before harvest, when the safety of any crop is assured, and *secondly,* after harvest, when it has been threshed out. In the one case the old surplus stocks are brought into the market, in the other the new grain. In some parts of Bengal prices rise in the interior of each district during the months of July, August, and September, owing to the difficulties of transport in the rainy season; in other districts, such as those of Eastern Bengal, where the internal communication is chiefly by water, prices tend to fall during these months. But, generally speaking, the food markets are affected chiefly in the manner explained above. Of late years, owing to the improvement of communications and the stimulus given to the grain trade by recent famine operations, a third and most important element of fluctuation has been introduced, viz. the demand for export to other districts or provinces, and the people, as others have done before them, are learning that what are called the blessings of civilisation do not always carry with them an improvement in their social condition. In former years surplus stocks were kept by the people because there was no market for them. The holders could afford to pay liberally in grain for field labour after putting aside sufficient for their own wants. Now they are tempted by high prices to sell off these stocks. If famine comes they have to buy at higher prices than those at which they sold: they incline to pay for field labour in cash instead of in grain, and the labourer consequently finds his stomach more empty than it was, especially where, as in Behar, the rate of wages has not risen proportionately with prices. The pinch of short rations is spread over a larger area and borne by a greater number than before; but it is none the less a pinch when it comes, and it comes now more frequently. It seems likely that the enormous stimulus recently given to trade in grain will have the effect of altogether revolutionising the economic conditions of the food-supply of Bengal. It has hitherto generally been held that any rise in price which quoted the staple food-grain at less than 12 seers to the rupee would indicate the approach of scarcity and the non-existence of large stocks; and that the non-landed and poorer artisan and shopkeeping class would feel this pressure, and could tide it over for only a short time; while prices ranging between 10 and 8 seers per rupee would denote scarcity requiring relief measures, and anything below 8 seers would indicate the existence of famine. But in fact all such calculations have been to a great extent falsified by the experience of the past year. Prices which would have been deemed famine prices in 1874 have been borne by the people of many districts without the appearance of any actual distress. The profits of the agriculturist have been so high that he has been able to hold on and support his field labourers in a manner perfectly surprising. Moreover the local circumstances of nearly every district in Bengal vary and differ so much that what would indicate famine in one does not necessarily do so in another.

A reference to the statement will show that in 1873–74 the rise in prices was fairly gradual, and that at no time was there any absolute deficiency of supply owing to famine such as there was in Orissa in 1866. In the present improved state of the trade and communications of the province, any future scarcity is not likely to be attended or marked by any very sudden rise or fluctuation.

When scarcity supervenes, and the prices of the ordinary grains rise, the people are driven to purchase the coarser and cheaper food-grains; the demand for these increases, and their price rises in greater proportion than that of the dearer classes of food, but ever to such an extent as to produce equality.

CHAP. I.Q.
BENGAL.
Mr. Toyn

ꞏP. I.Qn.16.

ꞏENTRAL ROVINCES.

r. *Nicholls.*

CENTRAL PROVINCES.

I have selected Saugor for the extreme north, Hoshangabad for the Nerbudda Valley, Seoni for the Satpura districts, Wardha for the Southern districts and Raipur for Chhattisgarh. These dictricts appear to the be fairest, being free from large cities, large military stations, and exceptional circumstances, and in the following table I have shown the range of prices for December, January, February, and of May and June for the year 1866–67, for 1872–73, and again, with a view to show the progress of the present tightening of prices, for the three past years. This present dearness of grain is caused, as already shown, by the famine in the west and south of India by exports to England, and by the blight which nearly destroyed our rabi crops in the spring of this year.

STATEMENT showing Price Current of Food-grain in certain Districts of the Central Provinces.

AP.I. Qx.16.

CENTRAL PROVINCES.

r. *Nicholls.*

My figures do not conclusively indicate any usual variation between the prices at harvest time and other times of the year, and experience does not warrant any conclusion.

It would be impossible to predict the approach of alarming scarcity solely from an examination of the local price current. It is absolutely necessary for a deputy commissioner to have a fairly correct idea of stocks, out-turn trade, and especially of the export trade, not only of his own district, but of neighbouring districts, and of neighbouring territories and Provinces. Without this, his own price current would only mislead him.

Before the severe scarcity of 1868–69 on our black cotton soils, and in the northern districts prices had been tightening for three years, and it was chiefly the purchasing power of the people which at length failed. The prices which ruled in the worst times were not much higher than our present rates.

But in the rice countries there was a rise, after the single failure of the staple crop in 1868, of nearly 50 per cent. in four months, after which it remained nearly stationary. The prices of other staples were similarly affected. Here the rise was sudden.

I will compare the prices of wheat and rice in the early part of 1868 with those for the corresponding period of 1869 for Bhandara and Raipur :—

—		January.		February.		March.		April.		May.	
		1868.	1869.	1868.	1869.	1868.	1869.	1868.	1869.	1868.	1869.
Bhandara -	Wheat -	25	11	20	10	23	11½	22	11⅜	22	10
	Rice -	28	11	25	11⅛	24	10¼	19	10¾	20	9¼
Raipur -	Wheat -	48	14	44	16⅝	52	16½	52	16¾	52	15
	Rice -	40	13½	40	14	44	14	40	13¼	40	12

This table does not show very clearly that the ordinary difference in the relative price of wheat and of rice was lost sight of.

In Nagpur and Wardha where jowari ordinarily is from ¼ to ⅓ cheaper than wheat, at a time when there was an excessive demand for jowari for the Deccan, and a fair demand, but a want of railway carriage, for wheat for export viâ Bombay to England, jowari was in 1877 sold dearer than wheat.

In ordinary years we may see marked fluctuations in the relative prices of wheat and of rice in the same district. For instance, at present in Seoni, where this year the wheat crop was almost entirely lost, wheat and rice are selling at the same rate, 10 seers for a rupee. But I find throughout 1866–67 and 1872–73, and up to December in 1875, wheat sold cheaper than rice. In that last month wheat was at 33 seers and rice 23. In the next month wheat went to 24 and rice to 25, next month wheat sold at 30 and rice at 27. Since then wheat has been cheaper than rice, but gradually approaching till June 1878, when the price stands at 10 seers the rupee for either sort. This is due to the loss of the wheat crop.

But I think, generally speaking, during our famine of 1868–69 the various sorts of grain maintained their ordinary relative values.

BERAR.

. Dunlop.

BERAR.

I have selected the Yeotmal taluka of the Wun district as a typical district in the upland country off the railway line, and the Amraoti district as a typical district in the low-land country which has railway communication.

The rates for jowari and wheat in these two districts have been as follows :—

—	Jowari.		Wheat.	
	Seers per rupee.		Seers per rupee.	
	Amraoti.	Yeotmal.	Amraoti.	Yeotmal.
1861–62 - - -	—	40	—	20
1862–63 - - -	—	27	—	12
1863–64 - - -	30	19	20	11
1864–65 - - -	16	24	16	10
1865–66 - - -	32	24	16	9
1866–67 - - -	20	24	8	8
1867–68 - - -	25	22	16	10
1868–69 - - -	15	18	10	10
1869–70 - - -	25	25	11	10
1870–71 - - -	30	22	12	10
1871–72 - - -	22	22	14	12
1872–73 - - -	32	22	16	16
1873–74 - - -	32	45	15	16
1874–75 - - -	46	60·25	19	23·75
1875–76 - - -	48·5	45·25	24·75	23·75
1876–77 - - -	21¼	11	15	19½
1877–78 - - -	14	17	11	10
1878–79 - - -	17	20	10	10

BOMBAY.

CHAP. I. Qn. 1

BOMBAY.

Mr. Peile.

A tabular statement among the appended papers gives the prices of produce (number of seers of about 2lbs.) per rupee in all the Bombay districts between 1861 and 1874. It is difficult to say what are normal prices, because prices are continually fluctuating. They were rather high in the Bombay Presidency up to A.D. 1818, then fell continuously to A.D. 1850, then rose up to 1870, being especially high in 1864–1869, and since 1870 have declined until famine raised the price of grain. The following rates, however, may be taken as a fair average:—

Number of pounds to be bought for 1 rupee.

—	Wheat.	Rice, common.	Jowari.	Bajri.	Kodra.	Nagli.
Guzerat -	20—25	16—20	30—35	30	40	—
Khandesh -	30	—	49—50	40	—	—
North Deccan	30	—	40—50	50	—	—
South Deccan	30	20	40—50	40—50	—	—
Concan -	20	23	15—20	15—20	—	33

Prices are from one-eighth to one-fourth higher at seed time than at harvest.

The following rises in past time have indicated severe scarcity:—

Number of pounds to be bought for one rupee.

—	A.D. 1790–91.				A.D. 1804–5.			
	Wheat.	Bajri.	Jowari.	Rice.	Wheat.	Bajri.	Jowari.	Rice.
Guzerat - -	6¾	16	17	4¾	—	—	—	—
Khandesh - -	12¾	13	—	6	14	14	—	5
North Deccan -	4	3½	4	4	3	4¼	4	3
South Deccan -	3¼	—	7	3¼	2½	—	3	1½
Concan - -	—	—	—	18	—	—	—	24

The rises appear to have continued over two or three years, probably bad harvests, and to have affected all the staples.

The following table compares prices of jowari and bajri in a cheap year (1868) with the highest prices in the late famine:—

District.	A.D. 1868.	A.D. 1877.	
		August.	September.
	Lbs.	Lbs.	Lbs.
Khandesh - -	27	19	18
Nasick - - -	24	18	17
Ahmednagar - -	46	14	14
Poona - - -	37	13	14
Sholapur - - -	47	11	12
Sattara - - -	45	12	13
Kaladgi - - -	53	10	9
Belgaum - - -	45	9	12
Dharwar - - -	71	9	11

MADRAS.

MADRAS.

Board of Revenue.

The four tables given below show the average monthly prices in terms of seers of 80 tolas per rupee of each of the main staples, viz., rice, ragi, cholum, and cumbu for the three years ending 1875–76, which may be taken as fairly representing the normal rates. In the Appendix will be found a statement showing the monthly average prices for each station of the Presidency.

A.

SECOND SORT RICE.

AVERAGE PRICES during the Three Years ending 1875–76 in terms of Seers of 80 Tolas.

South Canara	—	—	—	—	—	—	—	—	—	—	—	—
Malabar	—	—	—	—	—	—	—	—	—	—	—	—

Though, on the whole, prices seem to run lower at harvest time than at other times, it is by no means invariably the case. From the tables given above it appears that in Ganjam, which may be taken as a typical district for ragi, the average monthly prices for the three years in question varied from 41·60 seers per rupee in November to 34·65 seers in August, the latter month being also the harvest month. In Salem, where the ragi harvest is in October, the highest price appears to have been reached in February, and the lowest in August.

The limit of ordinary annual variation in prices may be gathered from the following table, which has been abstracted from the tables of averages above given, and shows the per-centage of increase over the lowest price :—

E.

Districts.	Rice, Second Sort.		Cholum.		Cumbu.		Ragi.	
	Limits of Variations.	Per-centage of Column 2 to lowest Price.	Limits of Variations.	Per-centage of Column 4 to lowest Price.	Limits of Variations.	Per-centage of Column 6 to lowest Price.	Limits of Variations.	Per-centage of Column 8 to lowest Price.

The Board do not think that it is possible to state definitely what rise in price would indicate the approach of alarming scarcity; but any rise in excess of what is shown above as an ordinary fluctuation would afford cause for anxiety if the season were also known to have been unfavourable.

It is only as regards two famines that sufficient information is available to permit of the effect on prices being traced in detail. The statement given below shows the nature of the rise in certain typical districts :—

AP.I. QN.16.

MYSORE.

r. Lacey.

MYSORE.

Mr. Lacey, Mysore.—The normal rate of prices is Rs. 3 per "Palla" of 100 seers of ragi, jola, gram, and paddy at harvest time, and rises to Rs. 4 or Rs. 5 at other times of the year. In 1872 gram was obtainable in the Mysore district, where I was located at the time, for Rs. 2 per palla, and could not obtain purchasers, at that rate gram being so abundant that several ryots resigned their lands, as their cultivation did not pay. This led to speculators purchasing and exporting gram, so that the market reached its normal state the next year. No distress need be apprehended so long as the price of grain did not exceed Rs. 5 per "Palla" of 100 seers; but distress among the poorest classes commences when prices rise above that limit, and when it reaches Rs. 10 per "Palla" we may safely say that we have come to the beginning of a famine.

AJPUTANA.

. Beynon.

RAJPUTANA.

Colonel Beynon, Jaipur.—The normal rate of prices of each of the chief staples of food-grains at the principal centres of the State are, wheat 16 to 17 seers (80 tolas per seer) per rupee, barley 21 to 22 seers, and bajra 19 to 20 seers.

At harvest time these grains are usually (if the out-turn is an average one) each about 20 per cent. cheaper.

A rise in the prices of these grains to 11, 15, and 13 seers per rupee respectively, would indicate the approach of alarming scarcity.

During the severe scarcity in 1868–69 the highest selling rates of wheat, barley, and bajra were 6¾, 8 and 7¼ seers per rupee respectively, and in the famine just past, when the distress was of less severity and duration, 9, 11, and 7 seers were the highest prices reached.

On both occasions the rise in prices was gradual, the advance continuing more or less uniform in respect to the different staples until the more critical and pinching condition was reached, when this uniformity ceased, and, as will be observed from the comparative rates above quoted, the prices of all staples became, as the distress waxed acute, more and more equalised, with the exception of bajra in 1877, the price of which was especially high owing to the great demand for this particular staple in our own provinces in the North-West, to which large quantities found their way from this part of the country about the sowing season of that year (June and July).

CENTRAL INDIA.

Haidarabad	18	22	—	—	10	12	10	12

The approach of alarming scarcity would be indicated by a rise in prices of over 50 per cent.

In past times of severe scarcity, so far as is known, prices have not risen very suddenly, but by gradual degrees. But when prices once begin to rise, they do so almost every day, until scarcity prices are reached. All staples are equally affected. The rise in prices of the cheapest staples of food tends to almost equalise the prices of all staples. Jowari and rice, the normal prices of which widely differed in days of plenty, sold for very nearly the same rate during the famine of 1876. The market rate of jowari and rice then was about four seers per rupee.

The following tabular statement showing the import and export of goods in 1286 Fasli will give an idea of the state of trade in His Highness's dominions.

hap.I.Qn.17.

CHAPTER I.—QUESTION 17.

What is the state of your Province as to the activity of commerce? Has it an energetic and enterprising trading class? Do any of the districts subsist mainly on their own resources, and export and import little? Or is there an active and constant ebb and flow of trade?

Punjab.

PUNJAB.

Major Wace.

There is no part of the province which does not possess an active and enterprising trading class; and throughout the province there is an active and constant ebb and flow of trade. The trading classes are not confined to the larger towns, but are to be found in almost every village in the province. There is no district shut up to its own resources, even the mountainous parts of Hazára and Kángra possessing their local trade. Some idea of the character of the internal trade of the province will be formed from the appended account of the trade of the 19 chief trading towns, which is extracted from the Trade Report for 1873–74.

Internal trade.—The amount of the internal trade of the Punjab, as shown by the traffic carried on at the principal trading centres, fell from 684 lakhs of rupees in 1872–73 to 568 lakhs in 1873–74. In 1871–72 it was 926 lakhs. It is not likely that these returns give and adequate representation of the state of trade in the province. They take no account of the trade of any of the towns except the 19 which have been selected to give some idea of the transactions. And even in the case of these 19, no articles are entered which skirt the towns in transit without paying octroi duty, nor of those which are conveyed by rail without entering them. Still, as regards these 19 towns, they convey some idea of their internal transactions, and they must accordingly be accepted as demonstrating a considerable decline in such transactions. This decline has been accounted for in some cases by general trade having been sacrificed to demand for grain for the famine in Bengal, the effect of which is only partially shown in the returns.

In the case of the towns of the Gurgaon and Hissar districts, the trade is said to have been diverted by the opening of the Rájputána State Railway.

The relative importance of the 19 towns for the last four years is shown by the annexed table:—

Order of importance.

——	1870–71.	1871–72.	1872–73.	1873–74.
Delhi - -	2	2	1	1
Rewári - -	16	15	14	14
Hissar - - -	13	13	15	13
Bhiwáni - -	4	4	3	3
Umballa - -	5	5	5	8
Ludhiána - -	7	7	9	7
Simla - - -	17	18	18	18
Jullundur - -	9	11	12	11
Kángra - -	12	10	8	9
Amritsar - -	3	3	2	2
Lahore - -	6	9	7	5
Ferozepore - -	11	6	11	12
Jhelum - -	19	17	19	17
Pind Dádan Khan -	15	16	16	15
Gujrát - -	18	19	17	19
Mooltan - -	1	1	4	4
Jhang - - -	17	12	13	16
Dera Ismail Khan -	10	14	6	6
Peshávar - -	8	8	10	10

The most notable descents in this scale are Umballa, Ferozepore, Mooltan, Jhang, Peshávar; while Lahore and Dera Ismail Khan show the greatest rise.

The internal trade of Umballa fell from 56 lakhs of rupees in 1872–73 to 21 lakhs in 1873–74. The Deputy Commissioner can only account for this remarkable decrease by supposing that the merchants of the city confined their speculations exclusively to dealings in grain on account of the Bengal demand. The greater portion of the grain collected at Umballa was despatched by rail without entering the town, to avoid all chance of dispute with the octroi contractors.

The decrease in Ferozepore is from 18 lakhs to 14 lakhs, but in 1871–72 the value of the trade reached 40 lakhs. No explanation has been given, but the returns of the bridge traffic, a few miles from Ferozepore, show an increase from 27 lakhs in 1871–72 to 41 lakhs in 1872–73, and 75 lakhs in 1873–74, so the decrease does not appear to be substantiated. The goods which pass the bridge, however, are to a great extent conveyed down the river by boat.

The falling off in the Mooltan trade was alluded to in last year's report. There has been a further decrease this year from 58 lakhs to 51 lakhs. A special report, received from the Commissioner of Mooltan, shows that this decrease is partly real, partly nominal. The cotton and indigo which used to come from Muzaffargarh and Dera Ghází Khan to Mooltan for local sale before export, is now exported direct to Karáchi. Boat-building is on the increase in these two districts, and the traders find it more profitable to locate themselves across the river and export direct.

On the other hand, octroi duty on cotton and indigo has been abolished in Mooltan, and the contractors are not interested in recording the import and export of these staples. The traffic is therefore under-estimated.

In Jhang the decrease has been from 15 lakhs in 1872–73 to 10 lakhs in 1873–74. The falling off is due to dullness in the Povindah trade, owing, it is said, to a glut in the Kábul market.

The falling off of the Peshávar trade is under investigation, special inquiry having been made by Government. Since last year there has been a further decrease from 22 lakhs to 18 lakhs, which is accounted for by the exclusion from the returns of this year of transit goods entered in the bonded warehouse, which were shown in the returns for 1872–73.

The Lahore trade increased from 29 lakhs in 1872–73 to 36 lakhs in 1873–74. The causes assigned are—improved registration, and the active demand for grain resulting from the Bengal famine.

Dera Ismail Khan forms an emporium for the Povindah trade, which passes on to Okárá, and is conveyed thence by rail. The rise in this trade was noticed last year. There has been a further increase this year from 30 lakhs to 33 lakhs of rupees. The construction of a bridge of boats over the Indus at Dera Ismail Khan during the year is an event worthy of being chronicled. The facilities of communication between Bhakkar and the Deraját thus afforded are great, and much appreciated by the people of the country and the Povindahs.

Chap.I. Qn. 1

North-Western Provinces.

Mr. Buck.

NORTH-WESTERN PROVINCES.

The best data on which an account of the trade of these provinces can be based are the statistics of railways, road, river, and canal traffic, collected under the administration of the local Department of Agriculture and Commerce. An account of the method in which statistics have been collected will be found in the appendix to reply 7, Part II. A., as well as in the trade reports herewith appended.

It must be understood that the period which the reports cover consists of 12 months from 1st April 1877 to 31st March 1878, but that railway statistics only commenced in October 1877. The report therefore only embraces six months of railway statistics, but since the submission of the report, new statistics for another six months have come in, which have been utilised in the following note.

For trade registration purposes, the railways of these provinces have been divided into blocks which correspond nearly with the administrative division of the province under Commissioners, and which are shown in the sketch map appended.

In the trade report for 1877–78, the statistics which had been collected were arranged under the following heads:—

External Trade.

(*a.*)—Foreign, *i.e.*, trade between the North-Western Provinces and Oudh and countries external to British India, *e.g.*, Nepal and Tibet.

(*b.*)—British or provincial, *i.e.*, trade between the North-Western Provinces and Oudh and other British provinces or protected Native States within British India.

(*c.*)—Trade between the North-Western Provinces and Oudh and the ports of Calcutta and Bombay.

Internal Trade.

(*a.*)—Trade within provincial boundaries not crossing the frontier.

(*b.*)—Town or municipal trade.

The *rationale* of the above divisions was to arrange information as to the amount and character of trade passing along different routes from one part to another of the province or from this province to other provinces, and required therefore geographical arrangement of traffic along principal routes. The present note, however, will deal more directly with the resources and needs of the province as regards principal commodities. So that while in the published report trade is primarily divided according to routes, in the present note the primary division will be according to commodities.

The most important factor in the distribution of trade by commodities is the character of the produce of each portion of the province. It will be useful at this place to refer to the general description which has been given of the physical features of this part of India in the reply to query 3, where the different circumstances of climate, soil, irrigation, &c., of the various sections of the province have been noticed. It was found convenient to divide the province into four belts (parallel with the Himalayas), of which the atmospheric and physical conditions are sufficiently diverse to justify demarcation, and it was noticed that the belts thus demarcated are crossed at right angles by a gradual change from dryness and sand to moisture and loam.

It was further noticed that the same circumstances which formed the basis of the distinction between the different geographical sections of the province have led to important differences in the class of crops grown in each. It will now be shown how this diversity of produce has been the chief factor in regulating the character of provincial traffic.

It is to be regretted that the only statistics with any pretence to completeness which are available are those for a year in which drought caused abnormal changes in the quantity of produce and in the direction of the movements of grain. At the same time it may be explained that much of the information which is now given is based on independent inquiry as well as on the statistics of the report.

The chief articles of trade produced in these provinces, of which there is a surplus for export from the localities of their production to other provinces, countries, or localities, are cotton (including cotton manufactures), indigo, wheat, other edible grains, oilseeds, sugar, and timber. Other articles of trade, such as hides, ghi, tobacco, &c., are of less importance, and may be classed together under the head of subordinate articles of trade.

On the other hand, the chief articles which the province or portions of the province need, and which are brought from outside, are European yarn and cotton cloth, iron and hardware, and salt. Of the chief articles supplied by the province some are produced, as above explained, in one part and some in another part of the provincial territory. There is therefore an internal ebb and flow in articles of provincial production in addition to the current of trade which cross the boundary.

Before proceeding, however, to notice in separate detail the trade in each of the "chief commodities," it may be convenient to give a very short description of the principal requirements of the provincial population. There are in the North-Western Provinces and Oudh about 42 millions of inhabitants whose individual wants are (with the exception of a very small per-centage) almost identical—even rich men living in very little better style than the lower classes. The wants of one family provide, therefore, an index to the requirements of all.

Food.—The ordinary food of a family consists of edible grains, salt, vegetables, spices, sugar, oil, milk, and "ghi," the product of milk, of which the first two are absolute necessaries and the last two luxuries.

Clothing.—The clothing of the family consists mainly of cotton cloth, sometimes supplemented by blankets of wool, with leather shoes.

Houses.—The houses of villagers and the poorer town classes are made of mud, building with burnt bricks being almost entirely confined to towns; they are roofed and supported with wooden beams and doorways and thatched with local produce.

Utensils.—Household utensils are a few brass, copper, and iron pots and dishes, clay vessels, and stone flour mills.

Fuel is cow-dung supplemented by wood.

Lighting is obtained by oil, but, as a rule, natives use little lighting.

Tools.—Of agricultural implements, ploughs, well gear, mattocks, and trowels, are made of wood and iron; sugar mills of wood or stone, ropes of local fibres, and irrigation bags of leather.

Luxuries (not being food) are tobacco, fine cloth, and jewellery. Taking, therefore, first those articles of which a comparatively large quantity is required by each family, and which therefore (on account of the large multiplier of 42 millions) must be the chief commodities of supply and demand, we find that they are—

Edible grains.
Oil and oil-seeds.
Salt.
Sugar.

Cotton.
Iron.
Wood.
Stone.

Edible grains and oil-seeds are, as a rule, produced locally in sufficient quantities for consumption, the surplus being exported, but occasionally a local deficit compels an indraught to one part of the province or another.

There is a steady flow of the remaining articles of the list from the localities where they are produced to the places where they are not produced.

Other articles noticed in the earlier paragraphs are either provided locally or are so small in weight as not to be worth classing as chief commodities, viz., milk, vegetables, spices, wool, tobacco, jewellery.

Passing now from the wants of the community as a congeries of individuals to the wants of the community

HAP.I. QN.17.

NORTH-WESTERN PROVINCES.

Mr. Buck.

as a national body, we find that they are stone, iron, timber, bricks, and mortar, all of which are required for public buildings, bridges, railroads, &c., but of which the last two are usually provided at the place where they are wanted, while the first three have been already mentioned. The list already sketched need not, therefore, be amplified, and the chief commodities required by the province, whether produced locally or imported, are, therefore:—

Cotton and cotton cloth.
Edible grains.
Iron and hardware.
Salt.
Oil-seeds.
Stone.
Sugar.
Timber.

The above articles, representing the chief wants of the people of India, are naturally the chief items in the internal trade of the country. But to these must be added some other articles, the production of which is stimulated by a demand outside Indian limits, whither they are exported viâ the ports of Calcutta and Bombay. The chief of these are wheat, indigo, and opium; wheat is already included under "edible grains," and indigo and opium will be added to the list.

The order in which these commodities will be noticed is that adopted in the classified list drawn up for trade registration purposes under the orders of the Government of India.

Cotton and Cotton Cloth.—Cotton is most successfully cultivated on the reddish light soil occurring in the western districts of these provinces (and on the banks of the Jumna), and on the black soil known as "már" or "cotton soil." In describing the belts into which the area of the provinces has been subdivided, it was noticed that red sandy soil was most prevalent in the north-westerly districts towards the Panjáb. In the sub-Himalayan and Rohilkhand belts, as well as in the Doab belt, it appears to be restricted to the western extremity, beginning to disappear in the Sháhjahánpur district, north of the Ganges, and in the Cawnpore district, south of this river.

Már soil is the rich black earth, supposed by some to be of peat formation, found almost exclusively in tracts south of the Jumna, and is known as the "cotton soil" of Central India.

The absence of cotton cultivation in districts of these provinces where it is not grown is probably due to unsuitability of climate as well as of soil, since it does not appear to thrive in damp localities. The general result is, that, owing to conditions of soil and climate, the cotton area is not precisely coterminous with the belt areas.

The cotton area may be divided into three tracts under each of which are given figures showing the area of cotton per head of population for certain typical districts.

I. *First tract.*— Western districts of Rohilkhand (Bijnor, Moradabad, and Budaun). East of Moradabad and Budaun cotton cultivation shows a marked decrease; thus the area per head is, roughly speaking, in Bijnor ·05 of an acre, while in Bareilly it is only ·017, and in Sháhjahánpur ·01. Further east still, in Oudh and the Benares division, cotton cultivation almost disappears. In the Gonda district barely ·001 of an acre is the average per head; and in Gorakhpur ·003, while in Rai Bareli the average is as low as ·0001.

II. *Second tract.*—The western districts of the Ganges-Jumna Doab.

In this tract the area of cotton cultivation reaches its maximum in the Aligarh district, where it averages per head ·1 of an acre. Going north-west of Aligarh there is a gradual decrease, the average for Bulandshahr being ·04, and for Meerut ·03. South-east of Aligarh there is a corresponding decrease, the average for Etah being ·05, for Etáwah ·07, and for Farukhabad ·02. In Cawnpore and Fatehpur there is an increase, the average being ·06 in both. The increase is probably due to the cultivation on the high land bordering on the Jumna, and this would also appear the reason for the excess exhibited by Etáwah over the neighbouring district of Etah.

Cotton cultivation decreases below Fatehpur, the average for Allahabad being ·01.

III. *Third tract.*—The trans-Jumna belt.

This is the tract in which black soil occurs.

There is also the light red soil in the region of the Jumna in the Muttra, Agra, and other districts near that river. The average for the Agra district is ·1, the same as that of Aligarh. The area increases to the east till in Jalaun it is ·11, and Bánda ·17, in both of which districts black cotton soil is found.

The area of cotton cultivation, then, may be described as an irregular belt, which, starting from the districts of Budaun, Moradabad, and Bijnor, sweeps round in a curve comprising all the Ganges-Jumna Doab districts to which the trans-Jumna region is appended as a fringe.

The weaving of cotton fabrics is somewhat restricted to the tracts in which the raw cotton is produced. The industry is not much centralised in particular towns or villages, except in the case of a few special kinds of cloth.

The available statistics of the internal trade of cotton bear out the deductions which have been made from the average area of cotton cultivation per head in the different portions of the provinces. Between the districts of Rohilkhand and those of the Meerut division, the trade in cotton and cotton-goods is not very considerable. This is as might be expected, since the Bijnor, Moradabad, and Budaun districts would appear to produce more than is needed for their own consumption, and any deficiency in the other Rohilkhand districts would be more easily supplied from them than from other districts across the Ganges. In the year 1877–78, however, raw cotton was exported by road from the Doab to Rohilkhand to the net amount of 16,939 maunds, while Rohilkhand sent 21,345 maunds (net) of cotton goods to the Doab. The failure of rain in that year, which was more severely felt in Rohilkhand than in the Doab, was probably the cause of any cotton being exported at all. And it is noticeable that about three-quarters of the amount exported went towards the Budaun and Sháhjahánpur districts, Bijnor and Moradabad only taking one-fourth. The export of cotton goods to the Doab is a good indication of the general character of the trade, since these were manufactured from the cotton crop of the previous year, which was of a normal character. Most of the cotton goods (17,064 maunds out of 21,345 maunds) came from the Bijnor district, which, as we have seen before, took least of the raw cotton which crossed the Ganges into Rohilkhand. We are, therefore, justified in assuming that in ordinary years cotton and cotton goods are exported from the Bijnor and Moradabad districts, while they are, if anything, imported by the more easterly districts of Rohilkhand. The import of cotton into Rohilkhand from the Doab is, however, trifling when compared with that into Oudh. It was noticed that in the sub-Himalayan and penultimate belts cotton cultivation becomes scarcer and scarcer going eastwards. Accordingly, in the year 1876–77 (a normal year) the net exports from the Doab to Oudh by road alone amounted to 168,772 maunds of raw cotton, and 12,362 maunds of cotton goods, besides which 22,363 maunds of European cotton goods (valued at Rs. 23,08,466) were exported by road. Most of the exports were from the city of Cawnpore, through which passes the greater part of the cotton destined for Oudh and the trans-Gogra districts of the Benares division. The chief distributing mart in Oudh is Fyzabad, which receives cotton from Cawnpore by road and rail, and from Agra by rail.

From the trans-Jumna districts cotton crosses into the Doab in large quantities. The trade chiefly centres in Cawnpore, though a certain quantity is consigned to Allahabad, and some is sent in boats down the Jumna. In the year 1876–77 the city of Cawnpore received from Bundelkhand 79,124 maunds of raw cotton as well as cotton goods to the value of Rs. 3,12,448. In the year 1877, 38,242 maunds crossed the Jumna going towards Allahabad, and in the same year nearly 22,000 maunds were despatched by boats down the Jumna. Bundelkhand is well known for its cotton manufactures, those of Mau-Ránípur being especially notable.

The internal trade in cotton which passes between the other divisions of these provinces, will be seen from the appended returns of railway traffic for the year ending 30th September 1878. It will be understood that the trade indicated by these figures is exclusive of that with tracts lying outside the provinces, and with the ports of Calcutta and Bombay, except in cases where the cotton destined for export is first consigned to an intermediate mart, where it is collected for despatch beyond the limits of the provinces.

The appended statement shows the trade in raw cotton which passed by rail between each of the "blocks" in these provinces during the year ending September 30th, 1878. In "exports" only that cotton is included which was exported to other blocks within the provinces, and similarly in "imports" only that imported from the blocks within the provinces :—

Railway Stations within limits of							
Meerut Division.		Agra Division.		Allahabad Division.		Benares Division.	
Imports.	Exports.	Imports.	Exports.	Imports.	Exports.	Imports.	Exports.
2,953	7,882	7,702	4,432	5,783	5,221	7,029	171

Railway Stations on			
Oudh and Rohilkhand Railway.		Muttra-Háthras Railway.	
Imports.	Exports.	Imports.	Exports.
3,948	9,841	482	956

On these figures the only blocks the net exports of which are considerable are Meerut and the Oudh and Rohilkhand Railway. Agra, which has been mentioned as one of the chief localities for cotton cultivation, actually imported 3,270 maunds more than it exported. The large imports of Benares will have been expected, since but little cotton is grown there. It is noticeable, however, that the imports into the Meerut and Agra blocks (which may be considered abnormal) nearly all took place between the months of October 1877 and April 1878, when the local cotton crops had almost entirely failed from want of rain.

Some judgment as to the surplus cotton produce of each block may also be formed from the exports to Calcutta during the same year. These were as follows:—

From Railway Stations within limits of			
Meerut Division.	Agra Division.	Allahabad Division.	Benares Division.
5,661	14,363	17,724	7,492

From Railway Stations on the	
Oudh and Rohilkhand Railway.	Muttra-Háthras Railway.
4,664	238

The total exports to Calcutta amount to 50,162 maunds. Those to Bombay are insignificant (915 maunds). The exports from the Allahabad division are almost entirely from the city of Cawnpore, which is included in it. Those from Benares are chiefly from Mirzapur, and consist not in locally grown produce, but in cotton collected there from other parts of the provinces. Before the extension of the East Indian Railway to Allahabad, Mirzapur was the chief cotton mart in Upper India, and though now most of its former trade has left it, yet it still retains a portion of the forwarding trade from the Rewah States.

It now only remains to notice the cotton trade which these provinces transact with neighbouring states or provinces. This may be summarised as follows, only net imports or exports being shown in each case. The figures for railway traffic are for the year ending September 30th, 1878, for road and river traffic for the year ending March 31st, 1877 :—

From the under-mentioned provinces and states cotton was imported into the North-Western Provinces and Oudh.

Provinces and States.	Amount of net imports.		
	By Rail.	By Road.	Total.
	Mds.	Mds.	Mds.
Panjáb - - -	5,101	39,965	45,066
Rajputana - -	1,190	32,455	33,645
Bundelkhand and Rewah -	—	6,723	6,723
Central Provinces -	1,03,237	635	1,03,872
Bombay Presidency -	1,703	—	1,703
Total imports -	—	—	1,91,009

Cotton, on the other hand, was exported to Bengal and to the country of Nepal.

The net exports to Bengal were—by rail, 29,768 maunds, and by road and river, 19,196 maunds; total 48,964 maunds.

The net exports to Nepal were only 407 maunds.

These provinces, therefore, on the whole, imported cotton, the net imports being 90,561 maunds.

European Cotton Goods.—These are imported into these provinces chiefly viâ Calcutta, Bombay taking little or no share in the trade. In the year ending 30th September 1878, the total imports from Calcutta aggregated 1,91,428 maunds, while those from Bombay only amounted to 48,249 maunds. As might be expected, they all come by rail, their value prohibiting their exposure to the risks of road or water conveyance. The imports destined for consumption in these provinces are, to a great extent, engrossed by the three towns of Gházipur, Cawnpore, and Delhi (the last, although in the Panjáb, being intimately connected in commerce with the North-Western Provinces), whence they are distributed (1) from Gházipur to the districts of the Benares division; (2) from Cawnpore to those of the lower and middle Doab as well as to the greater part of Oudh; and (3) from Delhi to the districts of the Meerut and Rohilkhand divisions. The railway returns for the year ending 30th September 1878 show this very distinctly. Below is appended an abstract giving the total imports from Calcutta to the railway stations in each of the divisions of these provinces :—

Benares.	Allahabad.	Agra.	Meerut.
59,670	96,427	12,878	12,557

Oudh and Rohilkhand Railway.
9,896.

Nearly all that consigned to the Benares and Allahabad blocks went to the towns of Gházipur and Cawnpore respectively. It will be seen that the amount taken direct from Calcutta by the Agra, Meerut, and Oudh blocks was comparatively small; and as a fact they receive most of their imports second hand from Cawnpore or Delhi.

From the three centres of trade the cotton goods are passed on either by railway, road, or river. Thus in ten months of the year 1876–77, 8,496 maunds crossed the Gogra river at Barhal on their way from Gházipur to Gorakhpur and Basti; while in the year 1877–78 the exports to Nepal viâ the Basti and Gorakhpur districts, amounted to 2,888 maunds, most of which had been consigned from Gházipur. The course of cotton goods can be traced southwards towards Rewah, to which in 1877–78, 2,742 maunds were exported. The statistics of railway-borne traffic show that the amount re-exported from Gházipur by rail is but small.

From Cawnpore European cotton goods are re-exported by railway as well as by road. During the year ending September 30th, 1878, 5,000 maunds were consigned from the Allahabad block (chiefly the city of Cawnpore) to stations in the Agra block. The appended statements show the amount re-exported by road during the year 1876–77 to Bundelkhand, Oudh, up country, and down country, that is to say, in all four directions :—

Bundelkhand - - -	10,648
Oudh - - - -	11,238
Up country, towards Agra -	1,939
Down country, towards Allahabad -	7,943

Of the share taken by Bundelkhand, 216 maunds were passed on to the native states of Chatarpur, &c., and from Oudh 1,282 maunds were passed on into Nepalese territory.

We have as yet no satisfactory statistics showing the amount of European cotton goods re-exported by rail from* Delhi to these provinces. In the year 1877–78, 2,833 maunds were exported by road from Delhi across the Jumna bridge into the Meerut division, while the exports by road towards Muttra were only 128 maunds. From the Meerut division European cotton goods find their way across the Ganges into Rohilkhand, and thence to Nepal and the hill districts. In the year 1877–78 the amount thus exported to Rohilkhand came to 6,008 maunds, of which 1,615 maunds were passed on to Kumaun and Garhwál.

The various threads of the trade in European cotton goods have thus been traced as they ramify throughout the country from the three centres of Delhi, Cawnpore, and Gházipur, each of which towns draws its supplies direct from the port of Calcutta.

Indigo.—The indigo plant is cultivated to a greater or less extent throughout these provinces, though its cultivation is most extended in those districts which possess the advantages of canal irrigation. It is somewhat extensively grown in the Benares division, though not so much so as in the neighbouring Bengal province of Tirhoot. Figures showing the per-centage of indigo area to total cultivated area are given for some typical districts, from which some idea can be formed as to the comparative extent of its cultivation in the different portions of the provinces.

Meerut Division.	Rohilkhand Division.	Agra Division.
Meerut - - ·57 Aligarh - 4·8	Budaun - ·13	Agra - - ·77 Etáwah - 3·62 Cawnpore - 3·84
Allahabad Division.	**Benares Division.**	**Oudh.**
Allahabad - ·03 Bánda - - ·01	Gorakhpur - ·71	Gonda - ·01 Partabgarh - ·47

It is noticeable that indigo cultivation, like that of cotton, reaches its maximum in the Aligarh district, above which it rapidly decreases; in the Sahéranpur district it is very rare. Below Aligarh it keeps very much to those districts which lie towards the centre of the Ganges-Jumna Doab, along the line of the Ganges Canal. In districts off this line, *e.g.*, Agra, there is very little indigo grown. The Ganges Canal ends at Cawnpore, and in the portion of the Doab below Cawnpore indigo cultivation is but little carried on, as is also the case in the district of Bundelkhand, in which there is very little irrigation. Although indigo cultivation would thus seem to follow on an extensive supply of water, yet north of the Ganges, in the damp climate of Oudh and Rohilkhand, there is comparatively little indigo grown. Beyond the limits of the Ganges Canal its cultivation seems to centre in the Benares division.

Without going into details, which would be out of place in this note, it may be stated that there are two methods of preparing indigo cake practised in these provinces, differing in the treatment of the dye when it has been extracted from the plant leaves. According to one method this is boiled before being made up into cakes, while according to the other it is merely strained and pressed. The former is practised in indigo factories owned or managed by Europeans, and is the only way in which indigo cake destined for export to Calcutta is prepared. In the latter way is made a great deal of the indigo cake manufactured for consumption in the country.

The trade in indigo is only important in respect to that which is exported to Calcutta, trade in indigo destined for consumption in this country being of scarcely more interest than that in the various other dyes which are locally produced or utilised. Thus in the exports from these provinces to the Panjáb safflower figures as 18,501 maunds, while indigo is only 1,018 maunds. It is then solely as an export to the port of Calcutta that indigo is deserving of notice, and the proportion in which the different portions of the provinces contribute to this may be judged from the subjoined table, which shows the amount of indigo cake exported by rail to Calcutta from each block during the year ending September 30th, 1878 :—

From Stations within the limits of the				From Stations on the		Total.
Meerut Division.	Agra Division.	Allahabad Division.	Benares Division.	Oudh and Rohilkhand Railway.	Muttra-Háthras Railway.	
19,246	10,661	7,046	5,681	3,716	371	46,121

These figures bear out the deductions, which were based on the per-centage of indigo cultivation, in making the Meerut and Agra divisions by far the largest exporting blocks.

So far as European enterprise is concerned, it seems admitted that indigo manufacture in these provinces has very much declined in the last 15 years, and this is evidenced by the number of factories which have been either abandoned altogether or sold for the most trifling sums. This may be due in part to the low price which indigo from these provinces now fetches in the Calcutta market, and in part to the competition of native manufacturers. In the last Calcutta price list, dated January 24th, 1878, it is noticeable that prices for Aligarh, Bulandshahr, and Mainpuri indigo vary between Rs. 172 and Rs. 132 8 0 per maund, the average price obtained being about Rs. 150. The prices rise as one goes down country, Benares indigo fetching Rs. 200, and Tirhoot averaging from Rs. 233 to Rs. 176. It is said that the indigo obtained from plant irrigated by canal water is inferior in quality as well as less in quantity than that from land irrigated from wells, though whether this has much connexion with the low prices of indigo from the canal irrigated districts of the Meerut and Agra Divisions may be a matter of doubt. At these low prices indigo cannot be manufactured at any great profit under European management, though native landholders, it is admitted, can do so, their position enabling them to obtain both labour and plant from their own villagers at far lower rates than European planters can bargain for.

In connexion with indigo may be mentioned the trade in indigo seed, which is an important item in the exports of these provinces to Behar and Bengal. It is found there that far better results are obtained from

---

* NOTE.—In the year ending September 30th, 1878, the railway imports from the *Panjáb* amounted to 24,613 maunds. Most of this must have come from Dehli. It was chiefly consigned to the following blocks—

Oudh and Rohilkhand Railway.	Meerut.	Agra.
10,835 maunds.	6,150 maunds.	4,704 maunds.

CHAP. I. QN. 1.

NORTH-WESTERN PROVINCES.

Mr. Buck.

seed imported from these provinces than from that locally produced. In the year ending September 30th, 1878, nearly 130,000 maunds of indigo seed were exported by rail from these provinces to Behar alone. A considerable quantity was sent in boats down the river Ganges; in the year ending March 31st, 1877, 35,975 maunds were thus despatched from the city of Cawnpore.

Wheat.—Wheat is noticed separately from the other kinds of grain produced in these provinces, because it is the only kind in which there is a large export trade to Europe. The following is an account of the history of the wheat trade and its prospects for the future, kindly furnished by Messrs. Reinhold Brothers, of Agra, at the request of the Department of Agriculture and Commerce:—

"Shipments of wheat from India to Europe have been made for a number of years from the ports of Bombay and Kurrachee, where the surrounding wheat-growing districts offered particular facilities added to a superior quality of grain and often less charges in bringing the stuffs to those ports.

"The extension of the wheat trade which refers to the North-Western Provinces and the Panjab, and has Calcutta as its shipping port, dates from the season 1875-76.

"The home market at the time did not show any peculiarity in favour of this trade, and it was only the unusually cheap price of wheat in these provinces which attracted attention to this branch of trade. Four or five good seasons had accumulated large stocks in all markets and districts, and the prices of wheat fell in markets like Cawnpore and Agra to 30 or more seers per rupee (taking as standard quality what is known in trade as Etawáh wheat, or, as a Calcutta mark, Mountain Club No. 2).

"The East Indian Railway Company made liberal concessions in conveying the grain, and so up-country merchants were actually able to offer their shipments in the Calcutta market at Rs. 2 to Rs. 2.2.0 per bazar maund ready bagged and packed for Howrah station.

"It was further facilitated by an exceptionally low exchange (about 1*s.* 6*d.*). The ship freight was at its normal rate during the season.

"The abolition of the wheat duty must have favoured the trade to the extent of its value, as any reductions or diminution of charges produce more chances for successful competition.

"The following (1876-77) season was again an exceptionally good wheat season for the Upper Provinces, with still a good surplus stock of former years, and the trade received a new impulse by the political aspect in the east of Europe. The blockade of the Black Sea caused considerable speculation and rise of prices in the English market, and now it became the demand of the home market which fostered and influenced the wheat trade in this country, and prices rose in the Calcutta market to Rs. 5 per maund. This rate could at the time not compete profitably in the English market, but was locally caused by the block on the railway; and as merchants had their shipping previously engaged, they had often to fill their vessels at heavy losses. This period has had another effect on the trade which is often overlooked, but in our opinion affects the business seriously. As said before, owing to the railway block, Calcutta merchants were often obliged to buy *pêle mêle*, of which native merchants took advantage by a careless and sometimes fraudulent system of packing, which ultimately led to no end of complications and vexations on the Commercial Exchange at home amongst all concerned, as consignors, consignees, brokers, and millers. The consequence of all was that Indian wheat must be offered comparatively much cheaper, on this account alone, to compete with American and continental grain. A check on the export trade of wheat commenced in the month of August 1877, when, with the failure of the rains, people became aware of the likelihood of a scarcity. The rate rose in a few days sufficiently to put a stop to further despatches to the Calcutta market, and by the end of last and the beginning of this year (1878) it was found that the stocks of wheat in the North-Western Provinces were pretty fairly exhausted, which was made very clear by the importation of grain into districts which were looked upon as the best wheat producers and feeders to the various marts. At this time the Panjab stepped in with supplies for the local demand, and was able to pass off its inferior and old grain, which had been found unfit for exportation to Europe.

"The prospect of the wheat crop of 1877-78 looked pretty favourable until marred by the cold winds of the month of March. In most districts the grain was not sufficiently developed, and consequently light and inferior.

"The scarcity in the North-Western Provinces kept the rates in the various bazars equal, and often above Calcutta market or export prices, or, putting it into figures, say about one rupee per maund too high for export.

"If it had not been for the exhaustion of stocks in the North-Western Provinces the past season would have been very favourable for exports, as the English market kept exceedingly high, and the large amount of shipping in Calcutta reduced the freights to the ruinous rates of less than 10*s.* per ton.

"We consider the exports of the last harvest from the upper provinces to the Calcutta maket insignificant, because at no time Calcutta orders could be worked profitably from any of our principal markets. However, some despatches were made, mostly by speculators who had in the beginning of the year contracted forward sales, and of course became losers in these transactions.

"We are further of opinion that a good deal of the last wheat crop has been kept in private hands in the districts, and will help to collect gradually again a surplus stock.

"A wheat trade with Europe can only be beneficial to this country as long as the surplus stocks realise better prices than they otherwise would by bringing the money to the country. Thus only does a good plentiful harvest mean more riches to the ryots, which has not always been the case.

"The Indian wheat trade will in future be based on either—

1. High prices in Europe or failure of crops in America.
2. Exceptionally good crops in India.
3. Low ship freight.
4. Low exchange.

"All of which may be caused by many and various causes, which it would lead too far to elucidate here.

"The increase of the export trade during the famine in Madras, we believe our general résumé will show, rested on the large surplus stock in the upper provinces, as the Madras Presidency was less a purchaser of wheat than of coarser sorts of grain.

"The principal cause of the check to the wheat trade was the rise of prices in this country.

"In conclusion we beg to say that if the markets in the North-Western Provinces have got over the effects of the late scarcity, we consider in ordinary good seasons the normal rate of wheat to be about 18 to 20 seers for one rupee, taking Agra as the centre, at which rate the European market would require already exceptional fluctuations to be able to compete."

It will be seen from this account that it was not till the year 1875 that wheat was exported from Calcutta in any very large quantities, and from that year to the year 1877, each year shows a decided increase. The failure of the June rains in 1877 gave the trade a decided check, which has since continued through a period of unusually high prices.

The parts of these provinces in which there is most wheat cultivation are the divisions of Meerut and Rohilkhand and the districts in Oudh which border on the Gogra. The subjoined statement shows the amount which was exported to Calcutta in the year ending September 30th, 1878, from each block, but it must be remembered that a great deal of wheat is not

AP.I. QN. 17.

NORTH-WESTERN ROVINCES.

Mr. Buck.

consigned to Calcutta direct from its place of production, but is first collected in intermediate marts, whence the Calcutta consignments are made. The chief of these marts are Cawnpore, Agra, and Delhi; the first for the districts of the Lower Doab, Bundelkhand, and Oudh; Agra for the districts of the Middle Doab; and Delhi for the districts of the Meerut division. Since Delhi is not the centre of these provinces, exports from it are not included, and therefore a portion of the wheat actually exported from these provinces does not figure in the returns.

From Stations within limits of the				From Stations on the		Total.
Meerut Division.	Agra Division.	Allahabad Division.	Benares Division.	Oudh and Rohilkhand Railway.	Muttra-Hathrás Railway.	
76,088	82,485	327,324	12,214	2,33,510	255	729,055

The year for which these figures are given was one which commenced with the failure of rain which was noticed above as giving a serious check to the trade; and throughout the year prices have been so high as to scarcely admit of exporting at a profit. The extent to which the trade fell off may be seen from the returns of wheat sent by road into Delhi from the Meerut division in the months of April, May, and June 1877, that is, before the failure of rain could be anticipated. This amounted to 637,257 maunds, very nearly the whole of which must have been for export to Calcutta.

In the year ending September 30th, 1878, a considerable amount of wheat was sent from these provinces to Bombay. The railway returns are summarised below. It must be remembered, however, that the wheat which is sent to Bombay was not destined for export to Europe, or to supply the abnormal demand occasioned by the *famines in* Bombay and Madras.

From Stations within limits of the				From Stations on the		Total.
Meerut Division.	Agra Division.	Allahabad Division.	Benares Division.	Oudh and Rohilkhand Railway.	Muttra-Hathrás Railway.	
13,026	8,370	56,203	583	59,432	—	112,778

Wheat was exported to Bombay in company with grain of other different kinds, and there is no reason why it should be noticed separately from them, since its export was influenced by the same conditions, and is not due to the European demand, as was the export trade to Calcutta.

Edible Grains other than Wheat.—The chief of these are gram (*cicer arietinum*), rice, and the autumn millets (*holcus sorghum* and *penicillaria spicata*); but there are numerous other kinds, each of which does not of itself deserve separate notice. These different kinds are not grown in the same proportion throughout the provinces; but as might be expected, different conditions in soil, climate, and water-supply make themselves seen very plainly in localising to some extent the different kinds of crops. This is especially evident with rice, which is most grown in the districts of the sub-Himalayan and penultimate belts. Thus the per-centage of rice area to total cultivated area is in Sahâranpur, 15·9; Bareilly, 27·8; Gouda, 50·1; and Gorakhpur, 38·5; while in Meerut it is only 2·2, in Aligarh ·6, in Cawnpore 2·7, and Bánda 3·6.

The portion of the cultivated area in these provinces which bears a crop in both autumn and spring is comparatively small, and by far the larger part bears only one crop within the year, which may be (*roughly speaking*) either sown in June and reaped in October, or sown in October and reaped in April. Examples of the former class of crop are rice and the various millets (joár, bájra, &c.); examples of the latter are wheat, barley, and gram. Whether the crop on any field is to be an autumn or spring one is determined partly by custom, which in some cases favours the alternation of autumn and spring crops, and partly by the conditions of the land as to water-supply, &c. Should the means of irrigation be scanty, or *nil*, other things being equal, an autumn crop would be grown, since this, gaining its water from the rains, is to a great extent independent of artificial irrigation. On the other hand, a spring crop is preferred for land which can be easily and effectually irrigated in case of the winter rain failing, as very frequently happens. From there being two harvests within the year it follows that the grain trade varies in different periods of the year not only in the kind of grain dealt in, but also in the direction in which it runs.

Causes affecting the conditions of the crops are often very local in their action, and so it is not uncommon to see a stream of export trade in autumn grain not only checked but turned by mere anticipation of a failure of the spring harvest.

A statement is appended showing the movements of grain by rail between the different blocks in these provinces during the year ending September 30th, 1878, as well as between these provinces and places outside their limits with which trade is transacted.

To understand the significance of the figures it must be remembered that the agricultural condition of the different quarters of the year was as follows:—

First quarter, October 1st, 1877, to December 31st, 1877.—There had been an almost complete failure of the autumn rains, and the autumn crop was consequently in great measure lost. The condition of the Rohilkhand and Agra divisions was specially bad and famine relief works were started first within their limits. Though, so far as the autumn rains went, the Meerut division was equally badly off, yet better means of irrigation saved a portion of the crop and a series of good harvests had filled the granaries. Great apprehensions had been entertained concerning the spring harvest for which rain was absolutely necessary, but a timely fall in October allowed of ploughing and sowing, while more rain in November gave hopes of a good spring harvest.

Second quarter, January 1st to March 31st, 1878.—Periodical falls of rain continued and made the prospect of a good spring harvest appear more and more hopeful. The area under spring crops was far larger than usual, since a great deal of the portion usually allotted to autumn crops was sown.

Third quarter, April 1st to June 30th, 1878.—The spring harvest when gathered in fell far below expectations, except perhaps in Rohilkhand. The failure of the autumn rains had considerably lowered the water level and the ground was far drier beneath the surface than is usually the case. From this the crops were stunted and weakly and ill able to resist the rust and blight which attacked them.

Fourth quarter, July 1st to September 30th, 1878.—At the commencement of this quarter it was feared that there was going to be a second failure of the rains. But all apprehension was relieved by a fall in August and September, which, though late, gave a fair average autumn crop.

The statistics of railway trade in grain which passed between the different blocks of the provinces show that in the first quarter of the year the Rohilkhand and Agra blocks imported very largely, while the Meerut, Allahabad, and Benares exported. In the second quarter there was a marked decrease in the imports, and the Meerut block alone was able to export to any considerable extent, while Rohilkhand still continued the chief importer. The third quarter is characterised by a large export from Rohilkhand, nearly all of which was taken by Agra. A good spring harvest had enabled Rohilkhand to recover its losses by the sale of its surplus. Between the other blocks trade decreased considerably. The chief feature in the fourth quarter was the export of grain to the Allahabad block. Rohilkhand was still the largest exporter, but Agra had sufficiently recovered itself to begin exporting. The import of grain by the Allahabad block was not to supply its own consumption, but merely indicates the collection of grain at Cawnpore for export to the ports of Calcutta and Bombay.

The statistics of grain trade between the provinces as a whole, and places external to them, exhibits variations of the same kind. The first and second quarters were characterised by enormous imports chiefly from Behar and the Panjab. In the third quarter exporting began chiefly to Calcutta, and this continued, but in a less degree, during the fourth quarter. A judgment may be formed from the figures of the first statement as to the proportions in which the imports were distributed between the different blocks of the provinces, or in which they contributed to the exports.

Iron (including Hardware).—Iron ore is indigenous in the hill districts of these provinces, and iron has always been produced from it by the rough processes of smelting known to the hillmen. Some years ago iron works were started by Government near Rámnagar, but from scarcity of fuel and difficulty of carriage as well as from inexperienced management they have not as yet been a financial success. The amount imported from the hill districts to the plains is not very considerable, only amounting to 1,799 maunds in 1877–78. Native iron is also imported from Nepal, but not to any great amount, the gross import in 1877–78 being 3,156 maunds. Iron occurs also in the range of hills which skirt these provinces to the southward in the territory of the native states of Gwalior, Bundelkhand, and Rewah. This is the source from which nearly all the country iron used in these provinces is drawn. In 1877–78 the imports from Gwalior amounted to 11,383 maunds, and from Bundelkhand 148,601 maunds. But throughout the provinces European imported iron and steel is gradually ousting the country article, being considered superior to it in quality and cheaper in price. No inconsiderable amount of European iron is imported even to those places in which country iron is indigenous. Thus in

Chap. I Qn. 17.

North-Western Provinces.

Mr. Buck.

1877–78 3,800 maunds were sent to the state of Gwalior, and 7,406 maunds to the hill districts of Dehra Dún, Garhwál, and Kumaun.

The imports of European iron and hardware reach these provinces principally viâ Calcutta, though Bombay takes a larger share in this trade than in cotton goods. During the year ending September 30th, 1878, 457,473 maunds were imported from Calcutta and 61,190 from Bombay.

The latter consisted chiefly of railway iron and was consigned to the Agra block, being destined for the Rajputana and Gwalior state railways. Probably for the same reason the Agra block took the largest share of the Calcutta iron (197,098 maunds). The Allahabad block took 135,076 maunds, most of which was consigned to Cawnpore, which is the chief entrepôt for iron as for cotton goods. It has been noted above that by far the largest imports of country iron are from the Bundelkhand state of Chatarpur, &c. Nearly the whole of this which is not consumed in the trans-Jumna districts finds its way to Cawnpore.

In the year 1876–77, Cawnpore received 42,777 maunds of iron from Bundelkhand and 60,766 maunds from up-country. A great part of this latter must have been from Gwalior. Nearly the whole of this must have been sent into Oudh, which received from Cawnpore in the same year 36,186 maunds by road, and 24,431 maunds by rail. Iron consigned from Calcutta to Agra and Meerut, as well as that received from Gwalior, is passed on to the districts of Rohilkhand and Oudh; in 1877–78 the amount which crossed the Ganges by road into Rohilkhand was 9,717 maunds and into Oudh 9,567 maunds, the latter exclusive of consignments from Cawnpore.

Opium.—The opium produced in these provinces is all extracted from poppy cultivated on account of Government. Its cultivation is only permitted in certain districts in which special arrangements are made with the cultivators by the officers of the opium department. The cultivators are permitted to grow the poppy on certain areas of their holdings and are assisted by money advances on condition that they give up the whole of the produce at a certain fixed price. The opium thus obtained is forwarded to the Government factory at Gházipur, where it is purified and made up into oblong cakes if for consumption in this country, and into round balls if for export to China. The districts in which the cultivation of the poppy is permitted are three in Rohilkhand (Bareilly, Budaun, and Sháhjahánpur), the Doáb districts from Etáwah and Mainpuri downwards, and all the districts in Oudh and the Benares division.

In the year ending September 30, 1878, the consignments of raw opium by rail to Gházipur amounted to 5,232 maunds from the Agra block and 15,545 from the Allahabad block. The amount consigned from stations on the Oudh and Rohilkhand Railway is not known. In the same year 129,754 maunds were exported by rail from Benares to Calcutta.

Salt.—The manufacture of salt is not permitted in these provinces, although brackish earth is of common occurrence, from which the extraction of an impure quality of salt was formerly a considerable industry. Salt is now obtained from four sources (i.) Thibet, (ii.) the Upper Panjab, (iii.) Gurgaon and Rajputana, (iv.) Calcutta.

(1.) *Thibet salt.*—Salt is brought from Thibet across the snow passes laden on the backs of sheep. It is fairly pure, containing some 93 per cent. of chloride of sodium (Inland Customs report, 1867–68, note 10), and is vastly preferred by the natives of Kumaun and Garhwál and by the Nepalese to any kind of salt which can be imported from the plains. It is said to have more piquancy of taste and to be more wholesome than either Lahori, Rajputana, or Calcutta salt, and it is only the former of these three kinds which competes with it in the hills, and that to no very great extent. On the other hand the consumption of Thibet salt is confined to the hills, and little or none ever reaches the plains. In 1877–78 the imports of salt from Thibet into the hill districts amounted to 31,709 maunds. During that year traffic between the hill districts and the plains was not registered, so it cannot be said whether any of this Thibet salt passed on beyond the hill districts. We have, however, statistics for 1876–77 which show that during that year only 101 maunds of salt passed from the hills to the plains. According to our present information Thibet salt would appear to be gradually giving way before that from the plains; the amount of this latter exported to Nepal in 1877–78 being some 13,000 maunds in excess of the exports in the previous year.

Thibet salt is the only variety which comes into those provinces untaxed. The advisability of taxing it has been fully discussed, and it has been decided that the advantages of taxing it would be incommensurate with the difficulty and expense of enforcing the duty, and the distress which would be caused to the numbers who now make a livelihood from the trade.

Salt is imported from the salt mines of the Upper Panjáb (Pind Dádan Khan, &c.), and in the plains is more generally preferred than all other imported varieties. Unfortunately Lahori salt has not been distinguished from other kinds in the registration returns, so that the amount annually imported cannot be estimated with accuracy.

In *Rajputana salt* is included that from salt pans and marshes in the Gurgaon district of the Panjáb, as well as that produced in Rajputana itself. There are several varieties: the most important are *Sambhar* salt from the lake of that name in the Jaipur territory, *Balambha* from the state of Bhartpur, *Dindwana and Pachbadra* from salt marshes in the Jodhpur state, and *Sultanpur* and *Salambha* from different parts of the Gurgaon district. All these varieties are obtained by evaporation, caused either naturally, as on the edge of lakes or marshes (Sambhar and Dindwana), or artificially by exposure in pans (Balambha, Sultanpuri, and Salambha). Now that treaties have been effected with those states of Rajputana in whose territory salt was produced, the places from which salt is imported are limited to the Upper Panjab, two places in Gurgaon, the Sambhar lake, and three other lakes in Jodhpur territory. By far the most important variety is the Sambhar, which is supplanting all other varieties in the consumption of the provinces, its import being facilitated and cheapened by a light line of railway running to the place of its production. The amount of this salt actually purchased during the past year was about 2,700,000 maunds, and it is probable that during the present year sales will reach a still higher figure. The light railway is hardly adequate for the carriage of the rapidly increasing trade. Agra and Delhi are the two centres of the salt trade. Through the former comes Sambhar salt, while the latter takes all the Gurgaon salt (Sultanpuri and Salambha), as well as some of the other varieties (Dindwana, &c). In the year 1877–78 the imports by road from Delhi amounted to 452,676 maunds, 109,169 maunds of which subsequently crossed the Ganges into Rohilkhand. The road imports from Rájputana to Agra in the same year came to 100,565 maunds.

We have already seen that the province of Rohilkhand draws most of its salt from Delhi. Oudh, on the other hand, is chiefly supplied from Cawnpore, to which Sambhar salt is carried from Agra in large quantities. In 1876–77, 141,093 maunds of salt were sent from Cawnpore into Oudh by road alone, while in the same year the total amount which crossed the Ganges between the Doáb and Oudh only came to 177,892 maunds. To this must be added the amount consigned by rail, both from Agra and from the Rajputana State Railway viâ Agra.

Cawnpore is also a salt distributing mart for the trans-Jumna districts of Bundelkhand. In 1876–77 63,390 maunds were despatched by road from Cawnpore towards Bundelkhand.

European salt imported viâ Calcutta does not come much further up country than Benares, at which place its cost is about that of the Rajputana article. During the year ending 30th September, 1878, CHAP I. QN.1

NORTH-WESTERN PROVINCES.

Mr. Buck.

60,000 maunds reached these provinces from Calcutta, of which 55,000 maunds were taken by the Benares block. From the East Indian Railway trade report for the half year ending 30th June, 1877 it appeared that in the six months, taking the whole length of the line, the amount of salt carried up country from Calcutta was about the same as that carried downwards from the Panjáb, Delhi, and Agra, each amounting to some ten lakhs of maunds. It appears then that these provinces take but a small amount of the Calcutta article, which will be still more diminished by any fall in price of Rajputana salt, whether owing to reduction of duty or cheapening of carriage.

Oil-seeds.—Under this head are included various kinds of seeds from which oil is extracted, the chief of which are linseed, mustard, rape, and til (or gingelly). These are grown all over the provinces, but, except in the sub-Himalayan and penultimate belts and the tract of Bundelkhand, they are as a rule not grown alone, but sown as a subordinate crop in the corn fields either along the edges as a border or in parallel lines across it, or broadcast. It is probable that in almost all parts of the provinces the quantity of oil-seeds produced is sufficient for local wants, if not for exportation, though it is chiefly from the two localities named above that there is a considerable surplus for export. The districts which export by far the largest quantity are those of Kheri, Bahraich, and Gonda, in the province of Oudh.

In the year ending March 31st, 1878 the net exports by road from Rohilkhand to the Doab were 98,017 maunds. In the preceding year the city of Cawnpore received by road 144,487 maunds from Oudh and 424,067 maunds from Bundelkhand. Mustard and rape were the most important items in the imports from Oudh and Rohilkhand, while of the various kinds which come from Bundelkhand linseed figures largest. Oil-seeds are collected in Cawnpore, not to supply local consumption, but for export to Calcutta, and it is as one of the most important of the exports to the ports, and not as an article of internal trade, that oil-seeds are chiefly remarkable.

The subjoined tables show the exports by rail to Calcutta and Bombay from each of the North-Western Provinces and Oudh blocks, in the year ending Sept. 30, 1878:—

Exports to Calcutta from blocks—

Description.	Meerut.	Agra.	Allahabad.	Benares.	Oudh, Rohilkhand Railway.	Total.
Linseed -	252	1,990	426,077	10,813	63,661	502,793
Mustard and rape.	27,543	126,805	783,699	37,333	37,477	1,012,857
Til -	—	253	5,195	9,361	—	14,809
Other kinds.	—	16,436	143,424	11,906	9,471	181,237
Total -	27,795	145,484	1,358,395	60,413	110,609	1,711,696

Exports to Bombay from blocks—

Description.	Meerut.	Agra.	Allahabad.	Benares.	Oudh, Rohilkhand Railway.	Total.
Linseed -	—	—	81,732	1,840	71,269	1,24,541
Mustard and rape.	5,502	53,785	412,338	497	34,998	5,07,120
Til -	—	—	112	—	—	112
Other kinds.	5	—	827	—	896	1,728
Total -	5,507	53,785	495,009	2,337	107,163	633,501

The Allahabad block is out of all comparison the largest exporter, and most of the oil-seeds registered, as leaving it were despatched from the city of Cawnpore, which is the chief collecting mart for them in Upper India.

A very considerable amount is sent down the Gogra from the Oudh districts of Bahraich and Gonda. This is most of it primarily consigned to Patna, whence it is despatched to Calcutta by rail. In the year ending March 31st, 1878, the oil-seeds exported down the Gogra amounted to 2,453,682 maunds, of which over 1,400,000 maunds consisted of linseed. The amount sent down the Ganges is thus over one-third more than that consigned by rail to Calcutta from all the blocks in the provinces.

Stone.—Stone is only found in the hilly districts at the upper and lower boundaries of the provinces. In the ordinary districts of the plains it does not occur, and its use in them is limited to the small hand-mills used for grinding corn and (in the eastern districts) to kolhus or sugar-mills. The towns which are noted for their stone-built streets are those which are situated near stone quarries, *e.g.*, Muttra and Háthras, from which the quarries in the Agra district are only distant 30 or 40 miles.

The use of stone being so limited in all places but those of its production, the trade in it is of but secondary importance. Gwalior, Bhartpur, and the Agra districts are the places from which most appears to be imported, coming as in slabs or hand-mill stones. The former are used for building purposes, and do not, as a rule, travel far; the latter are distributed over the whole of the Meerut, Rohilkhand, and Allahabad divisions.

In the year ending March 31st, 1878, 205,902 maunds of stone were imported by road from the native states of Gwalior, Rajputana, and from the trans-Jumna portion of the Agra district. Agra is the chief stone mart in the provinces, and it re-exports the stone it receives by road and by rail.

By road the stone passes up viâ Háthras towards Rohilkhand, which in the year ending March 31st, 1878, received 5,851 maunds. A considerable portion is embarked on the Ganges Canal in the Aligarh district, and sent down to Cawnpore, which in the year ending March 31st, 1877, received 5,949 maunds in this way. Cawnpore distributes the stone to Oudh on one side and Bundelkhand on the other.

A considerable quantity of stone is despatched from Agra to Muttra and Delhi, part of which is despatched by the Agra canal, and part by road. In the year ending March 31st, 1878, Delhi received by road 26,851 maunds, 1,752 maunds of which she re-exported by road to Meerut.

The subjoined statement shows the exports of stone from the Agra block to each other North-Western Provinces and Oudh block during the half-year ending March 31st, 1878:—

From Agra block to block—

Meerut.	Allahabad.	Benares.	Oudh and Rohlkhand Railway.	Muttra and Háthras Railway.
24,099	20,101	3,239	17,062	—

Sugar.—The natural area for the cultivation of the sugar-cane in these provinces would appear to be the sub-Himalayn and penultimate belts, in the former of which it is frequently grown without irrigation, while in the latter it is, as a rule, irrigated, except in exceptionally situated tracts, such as the alluvial beds of rivers, &c. But to this area must now be added a great portion of the districts irrigated by the Ganges canal, in which facilities for obtaining an abundant supply of water are gradually extending sugar-cane cultivation over tracts which formerly were strangers to it. The per-centage of sugar-cane area to the total cultivated area ranges in the Rohilkhand districts from 8 in Bijnor to 2·7 in Budaun, in the trans-Gogra districts of Oudh and the Benares Division from 3·2 in Gorakhpur to 1.5 in Gonda, and in the cis-Gogra districts of Oudh, within the limits of the penultimate

Chap.I. Qn.17.

North-Western Provinces.

Mr. Buck.

belt, from 5·5 in Fyzabad to 3·9 in Sitapur. There is also extensive sugar-cane cultivation in the Azamgarh and Jaunpur districts.

South of the penultimate belt, sugar-cane cultivation seems limited to those districts in which there is canal irrigation, and occurs to any considerable extent in only a few of these. Thus the per-centage is in Unao 1·4 and in Agra ·6, while in Meerut and Etah (both canal-irrigated districts) it is 6·4 and 2 respectively. In both of these latter districts a considerable amount of cane is grown on the old alluvial bed of the Ganges, which is not irrigated from the canal. Districts which depend for their cane cultivation on the canal alone do not show such high per-centages.

Speaking generally, it may be said that the portions of the provinces where sugar production gives a surplus over consumption are the Meerut, Rohilkhand, and Benares divisions, and the province of Oudh; while the trans-Jumna tract from Agra to Bánda imports largely, and the districts of the middle and lower Doáb to a less extent.

In the year ending March 31st, 1878, 446,162 maunds of sugar crossed the Ganges from Rohilkhand and the Doab by road alone, and in the preceding year 337,873 maunds crossed from Oudh into the Doab. In this latter year 1,27,498 maunds were sent by road towards Bundelkhand from the city of Cawnpore.

The subjoined statistics show the railway trade in sugar during the year ending September 30th, 1878, between each of the different blocks in the provinces to each other block in the provinces:—

Exports of Sugar by Rail from each of the Blocks in these Provinces to the other Blocks in the Provinces.

From Blocks—

Meerut.	Agra.	Allahabad.	Benares.	Oudh and Rohilkhand Railway.
50,392	1,875	26,470	76,695	152,011

Imports of Sugar by Rail to each of the North-Western Provinces and Oudh Blocks from the other Blocks in the Provinces.

To Blocks—

Meerut.	Agra.	Allahabad.	Benares.	Oudh and Rohilkhand Railway.
64,602	174,251	46,171	242	26,526

It will be noticed that taking merely internal trade into consideration, the Benares and Oudh and Rohilkhand railway blocks are the largest exporters, while the Agra block is by far the largest importer of sugar. The export trade in sugar to the ports is not considerable in amount. The trade with all the other tracts adjoining those provinces is one of export, with the exception of the province of Behar, in Lower Bengal, from which sugar is imported in considerable quantities.

Sugar is largely exported to the Panjab by road and rail. By road the net exports in the year ending March 31st, 1878, amounted to 437,238 maunds, while the net exports by rail in the year ending September 30th, 1878, were 126,525 maunds, the largest exporting blocks being the Oudh and Rohilkhand Railway and the Benares division. Rajputana also takes a good deal of sugar, the net exports by road being 140,702 maunds in the year ending March 31st, 1878, and by rail 206,919 maunds in the year ending September 30th, 1878, the principal exporting blocks being the Allahabad and the Oudh and Rohilkhand Railway.

The export trade with the Central Provinces and the states of Bundelkhand is not considerable enough to deserve separate notice.

The net imports from the provinces of Behar by road only just balance the exports, while the exports by the river Gogra are enormously in excess of the imports, amounting in the year ending March 31st, 1878, to 619,959 maunds. The districts in these provinces immediately adjoining Behar are all large sugar producers, and the local trade between them and the Bengal provinces is much in their favour. The sugar exported by the Gogra must have been destined for places beyond Behar itself. The imports from Behar by rail in the year ending September 30th, 1878, amounted to 261,774 maunds, the major portion of which was taken by the Agra division.

Sugar is not so well or carefully cultivated in the North-Western Provinces as in many other parts of the world, and its manufacture is conducted by very rude processes. The attention of this Department has been turned to the improvement both of the cultivating and manufacturing systems; and new processes, either recommended by European planters, who are personally engaged in the production of sugar, or specified in the treatises on the industry in other countries, have become the subject of experiment. Endeavours are also being made to procure new plants from outside India. Should material improvement be possible, there is no reason why these provinces should not compete in better markets.

Timber.—The only portions of the North-Western Provinces which do not seem to produce sufficient timber for the ordinary domestic and manufacturing purposes are the districts of the Meerut and Agra divisions, many of which in their conspicuous treelessness resemble the neighbouring tracts of the Panjáb and Rajputana. It is in these two divisions that the greater part of the timber trade seems to centre which is destined for the supply of provincial requirements. By rail the only large importer is the Agra block, which in the year ending September 30th, 1878, imported 57,032 maunds net; but this was not entirely to supply local consumption, for some portion of the timber, though consigned to Agra, was merely collected there for despatch to Rajputana. Delhi is another centre for the timber trade, and shares with Agra a transit traffic in timber between the more thickly-wooded parts of these provinces and the treeless plains of Rajputana and the Panjáb.

Although, as stated above, most districts in these provinces produce enough timber for ordinary purposes, yet the only tract from which there is much timber exported is that which has been designated the sub-Himalayan, to which may be added the southern portions of the Bundelkhand districts.

But by far the larger portion of the timber which crosses the provinces comes from the country of Nepal, entering our territory both by road and river. In the year ending March 31st, 1878, the imports of timber from the Nepal forests amounted to 591,892 maunds.

From the sub-Himalayan region, therefore, whether in our territory or in that of Nepal, most of the timber is despatched which figures in the trade of these provinces. The course of the trade is, roughly speaking, at right angles to the line of the principal rivers; and in consequence, though conveyance by water is peculiarly suitable for timber, it is only in the first half of its journey that rivers are much used for transporting it.

On first leaving the place of its production the timber is generally made up into rafts and floated down the streams which flow towards the Ganges or Gogra. On both these latter rivers there are large timber wharves, at which these rafts are unloaded. The chief wharves on the Ganges are Garhmukhtesar, in the Meerut, and Anúpshahr, in the Bulandshahr districts. Timber is floated down in the rains to these places from the Bijnor jungles, and from them is despatched by road to Meerut, Delhi, or Agra. A considerable quantity is also consigned to these three towns by road direct from the forest it is cut in. Thus, in

CHAP. I. QN.
NORTH-WESTERN PROVINCES.
Mr. Buck.

the year ending March 31st, 1878, 149,216 maunds of timber and 317,810 maunds of bamboos crossed the Ganges from Rohilkhand into the Doab, coming in carts from the Bijnor and Tarái forests. As noticed in the answer to question 20, the dam of the Ganges Canal at Narora prevents rafts from Bijnor going down the Ganges below that point, and thus all the timber from Bijnor is concentrated at the Garhmuktesar and Anúpshahr wharves. Below Narora the Ganges receives timber from the Rámganga and Garra rivers, on which it is floated down from the Tarái above Bareilly. Part of this goes to the Farukhabad wharf and part to that at Cawnpore.

The chief wharves on the Gogra are those of Khairi and Bahrámghat; the latter is by far the most important, and is the great timber entrepôt for the Nepal forests, which lie on or near the Gogra. From Bahrámghat the timber crosses into the Doab by either road or rail; by rail 41,422 maunds were exported from the Oudh and Rohilkhand railway block (in which Bahrámghat is situated) during the year ending September 30th, 1878.

Subordinate Articles of Trade.—The most important of the other commodities which figure in the trade of these provinces are hides, ghí, tea, and tobacco.

Hides are exported to Calcutta in considerable quantities from the towns of Delhi and Cawnpore.

Ghí (clarified butter) is another export to the ports, consigned chiefly from those parts of the provinces where there is much waste ground for the grazing of the cattle from whose milk the ghí is made. Thus it happens that the little town of Jaswantnagar, in the Etáwah district, exports a considerable quantity of ghí each year, being situated near a large tract of raviny ground on the Jumna bank, well suited for cattle grazing.

Tea is grown both in Kumaun and Dehra Dún, but its cultivation would appear to have almost reached its maximum. The annual exports from Kumaun are estimated at about 500,000 lbs., of which some 300,000 lbs. are purchased by Kabuli merchants, and taken by them to Bokhara and other parts of Central Asia.

Tobacco is grown in almost every part of the provinces, but chiefly in those districts where the climate is damp and soil moist. It is, with pán, the chief luxury of Indian consumption, and is either smoked or chewed by almost every native in the country. The best qualities grown in the provinces are from Rohilkhand and Oudh, which exported to the Doab by road in the year ending March 31st, 1878, 9,825 maunds and 31,897 maunds respectively. A tobacco farm has been lately started at Gházipur and Poosa (in Bengal) by a Calcutta firm, under the management of an American curer, and there is good reason for expecting that a cured leaf will be produced which will command a ready sale in the European market.

The broad characteristics of the trade of the North-Western Provinces and Oudh have now been noticed from the aspect of the chief commodities in which this trade consists, and it seems unnecessary here to go again over the same ground from another point of view, re-classifying the trade according to the different streams in which it runs, and the different states or provinces affected by it. Reference may be made for this to the trade report for the year ending March 31st, 1878, in which this latter was the mode of classification primarily followed.

As has been stated before, although statistics of road and river traffic are available for the whole of the year 1877–78, yet the railway statistics which have up to date been collated are only for six months of this year. If to these figures could be added the railway returns for the first six months of the current year (1878–79), we should have railway figures for a complete year, but although this could be done in the case of a few particular commodities, it has been found impossible with the trade as a whole. But even if the railway statistics were completed in this manner little more than a rough guess could be hazarded as to the total trade of the year they concern, since the road and river returns would be for different years coinciding in period for six months only.

Trade in these provinces consists almost so entirely of traffic in country produce that a history of the movement of produce from the field to its eventual destination will comprise a description of the classes engaged in conducting the movements of trade.

To begin with the cultivator. He has three ways of disposing of his surplus out-turn. Firstly, he may take it to the nearest mart, and dispose of it himself, which he does by applying to a "weighman" (and as a rule he generally contracts a habit of going to the same "weighman" year after year), who finds out for him a purchaser and helps to arrange a price, receiving in return a commission or weighment fees.

Or, secondly, he may dispose of it by arrangement at his village to one of the petty traders or produce collectors, termed *baipáris,* who travel about the country for the purpose of collecting produce. Very often the *baipári* confines his operations to the same set of villages year after year, and makes advances to cultivators, with whom mutual credit has been established for delivery of grain. As a rule, cultivators carry in on their own carts the produce which the *baipári* purchases for the central mart.

The *baipári* purchasers are supplemented by special agent, occasionally sent out by central firms for special purchase.

Or, thirdly, the cultivators dispose of their produce to a local collecting merchant, who is sometimes a merchant pure and simple, sometimes the village banker, who, in his operations with the cultivating classes advances from time to time money, food, or grain, to be repaid at harvest, sometimes a wealthy member of the agricultural body who generally does a good deal of advancing business. These men dispose of the grain they collect from their small circle to the *baipáris* agents, or merchants, of small marts in the neighbourhood, and they too are often given advances by *baipáris* and agents for the delivery of a certain quantity of grain at the time of or shortly after harvest.

At the next stage in the trading scale we find firms (kotís) or branches of firms in the marts or collecting centres, to whom the weighmen and baipáris sell the produce either for transmission to other parts of India, where higher prices are ruling, or to the ports for export.

Usually a firm of any standing has branches in several places with its head-quarters at one or other of them. One of the principal firms in the North-Western Provinces has, for instance, its head-quarters at Allahabad with branches at Calcutta, Patna, Cawnpore, Agra, Delhi, and several other places. Another smaller firm, with its head-quarters at Agra, has only branches at five or six places all within 100 miles. As the first firm collects in a larger circle than the second, so also there are circles still smaller in which the head-quarters of the firm is probably found at a more insignificant mart.

If a firm wishes to collect from a place in which it has no branch, it does so by sending a commission to a firm of that place, or to a commission agent called "áratya." Commission business is termed "árat," and the "árat" of a firm often constitutes its principal work.

Payment for produce is effected by a system of "hundís" or bills of exchange, which are more commonly drawn at 51 days than at any other date. The "hundís" of well known firms are current at the principal marts and are negotiated by shroffs or bankers.

Hundís are provided by a class of "bill-brokers" called "*daláls,*" who are sent for by purchasing house or agent when hundís are required, and whose special business it is to know where hundís for every place of trade can be procured, and in what marts they are negotiable.

Credit is given under the hundi system to a limited extent. Each house has its "name" in the market for a certain capital and is allowed credit accordingly.

ENGAL.

. *Toynbee.*

BENGAL.

In no part of India, perhaps, is commerce more active than in Bengal. Calcutta is, of course, the centre and focus of the trade and commerce of the province, but there are many other large trade centres in the interior (shown in the accompanying map) situated on the great waterways of the country. The state of trade and commerce in Bengal is illustrated by the following table taken from Mr. Cotton's report on the internal trade of Bengal for 1876-77. The figures merely show the quantities of staples passing the registering stations; and are neither exhaustive nor strictly accurate.

List of Articles.	By Country Boats.	By River Steamers.	By Rail.	By Road.	Total.	
					Quantity.	Value.
	Mds.	Mds.	Mds.	Mds.	Mds.	Rs.
Rice and paddy—						
Rice not in the husk	18,280,600	35,500	4,469,500	1,900,200	24,995,800	5,68,02,000
Rice in the husk	5,903,400	—	29,800	877,300	6,810,500	
Wheat	2,733,000	10,300	4,822,500	20,900	7,586,700	1,51,73,000
Pulses and gram	4,272,400	65,000	1,124,700	265,100	5,727,200	1,00,23,000
Other food-grains	1,843,000	—	107,300	314,000	2,264,300	39,63,000
Total of food-grains	33,032,400	420,800	10,553,800	3,677,500	47,384,500	8,59,61,000

	No.	No.	No.	No.	No.	
Hides	1,421,200	12,300	3,502,700	119,900	5,056,100	1,01,12,000
	Mds.	Mds.	Mds.	Mds.	Mds.	
Saltpetre	337,000	—	518,400	19,300	874,700	52,48,000
	Rs.	Rs.	Rs.	Rs.	Rs.	
European piece-goods	1,20,82,100	56,77,200	9,38,75,600	30,17,600	—	11,46,53,000
	Mds.	Mds.	Mds.	Mds.	Mds.	
Cotton twist (European)	62,100	2,900	97,800	7,500	170,300	1,19,21,000
Salt	6,633,000	108,400	2,384,700	304,600	9,430,700	4,71,53,000

All the staples shown in this table, with the exception of salt and cotton piece-goods (which are exported from Calcutta into the interior of the country), find their way towards Calcutta chiefly by country boats along the magnificent water routes shown in the map. Along the lines of these established trade routes there has been an energetic and enterprising trading class from the earliest times. They have their agents in the interior who bring the surplus produce of each district to the most convenient point for embarkation. It may be said generally that every district in Bengal grows more than enough food-grains in ordinary years to support its own population, and exchanges its surplus produce for cotton piece-goods, salt, or food-grains of other kinds than those it grows itself. There is thus a constant ebb and flow of trade which penetrates more or less deeply from road, rail, and river into every district in Bengal. The further the distance of a district from the great highways of commerce, the smaller is the activity of its trade; the fewer the number of the trading classes, on the other hand, the larger are its surplus stocks of grain. In times of ordinary and local scarcity the trading classes of Bengal are quite energetic enough as a body to supply the deficiencies of one district from the surplus of another, so long as the regular and established trade routes and connexions are available for the purpose. Only in cases of very isolated portions of the province—such as Orissa was in 1866—and in times of very widespread famine (as in 1874) would it be necessary to supplement the resources of private trade by State interference and assistance. Mr. Cotton says: "Nowhere "in all India is internal traffic more active than it is "in Bengal when the rivers are full of water, when "every river is turned into a highway for the country "craft laden with merchandise, every stream into a "pathway, and every creek into a harbour for boats. "During the dry season of the year, when the lesser "rivers are not navigable, there is comparative "stagnation in internal communication." These water-routes were largely made use of in the famine of 1874.

CENTRAL
ROVINCES.

r. Nicholls.

CENTRAL PROVINCES.

In all the districts traversed by railways commerce is particularly active. The chief centres are Nagpur, Kamptee, Hinganghat, Wardha, on the railway and Toomsar, an entrepôt for grain in the Weingunga valley, and Dongargarh in the west and Raipur in the centre of the Chhattsigarh plain.

In the Nerbudda valley we have the manufacturing towns of Burhanpur, Khandwa, Harda, Seoni of the Hoshangabad district, Gadarwara, Narsinghpur, and Chota Chhindwara, Jubbulpore, and Murwarra.

There are large exports of grain from the Seoni, Chhindwara, and Betul districts. Saugor also has a

CHAP. I. QN. 17.

CENTRAL PROVINCES.

Mr. Nicholls.

fairly active trade especially towards the north. Comparatively speaking, commerce is dull in Damoh, Mandla, Bilaspur, Sambalpur, and Chanda.

The external trade of the provinces increased from 102,341 tons in 1863–64 to 390,106 tons in 1876–77. The value in the former year was estimated at 3,909,008*l*. Cotton was then selling at extremely high rates owing to the American war.

Twelve years afterwards the external trade was valued at 8,113,619*l*.

The provinces have a fairly energetic and enterprising trading class in the districts in which there is brisk trade. In fact, elsewhere we have men of the trading class, possessed of capital and latent enterprise, but it is only where the railway penetrates or other adequate means of easy communication is opened out, that the energy and enterprise of the class is brought into play.

In the first rank as traders stand the Marwaris, to be found throughout the provinces. Lately several European agencies have been opened at Nagpur, Jubbulpore, and Harda; at Hinganghat and Wardha the cotton trade is almost entirely in the hands of the Mofussil Company and of Messrs. Warwick Brothers; and during the late dearth in Bombay and the Deccan, swarms of Bhattias, Banias, and Comptis came into the provinces to purchase produce, and many native agencies from Bombay, of more or less permanency, have been established.

Chanda and perhaps Sambalpur may be said to subsist mainly on their own resources, and do not export much, at least as compared with the other districts. Mandla, Damoh, and Betul figure next in this respect.

The remaining districts enjoy an active ebb and flow of trade, but as the exports very greatly preponderate, most of the districts absorb large quantities of bullion.

BERAR.

BERAR.

Mr. Dunlop.

The answer to this question is scarcely complete without reference to the weekly bazaars, which (besides numerous annual fairs) play such an important part in the machinery of distribution in these parts.

Thse bazaars are held weekly at some 300 places. Their attendance varies from 20,000 to some few scores of persons. The majority have a considerable attendance; and, besides brightening the whole life of the people, they stimulate trade and the interchange of commodities to an incalculable extent. It is quite a common thing for traders to go 20 miles to their bazaars.

And in point of commercial activity generally Berar stands very high. Apart from the traffic by railway, there is an active intercourse with the Central Provinces on the east: and in the cotton season every road carries cotton carts in search of a good market. Cultivators who are well enough off to sell their own cotton are by no means tied to one market. On the contrary, they are most keenly alive to any rumours regarding the demand for cotton at the various exchanges, and are quick to take their crop to the place where competition among buyers is greatest.

Since the introduction of the railway into Berar the trade of the province has been steadily increasing. The chief articles of exports are cotton, oil-seeds, wheat. And of imports, cotton piece-goods and yarns, iron, wheat, rice, sugar, spices, cocoanuts, salt.

The largest trade is carried on in cotton, the exports of which in the last four years have been valued as follows:—

	Rs.
1874–75 - - -	2,12,92,260
1875–76 - - -	1,62,90,970
1876–77 - - -	2,25,65,883
1877–78 - - -	2,27,99,291

The trade in wheat and oil-seeds for export to Europe is on the increase, although it has been interfered with during the past two years by the famine traffic on the line.

The total trade of the province, including road-borne traffic, the returns of which are, however, very incomplete, is reported to have been as follows:—

	Imports. Value. Rs.	Exports. Value. Rs.
1877–78 -	2,48,26,652	3,77,07,998
1876–77 -	2,36,01,790	4,81,56,310

The actual traffic by railway, the route by which the chief trade of the province is carried on was as follows:—

	Imports. Rs.	Exports. Rs.
1877–78 -	1,91,63,583	3,38,28,313
1876–77 -	1,91,57,244	4,49,34,564

The falling-off of the exports noticeable in the figures is due to the abnormal traffic of 1876–77 in grain to the famine-stricken districts of Southern India having ceased.

Trade Returns.

The total trade of the province, including road-borne traffic, the returns of which are, however, very incomplete, is reported to have been as follows:—

	Imports. Weight Maunds.	Value. Rs.
1877–78 - -	2,227,253	2,48,26,652
1876–77 - -	2,094,850	2,36,01,790

[NOTE.—The figures for 1876–77 include articles recorded both by weight and numbers, but in 1877–78 these have been kept distinct, and the above figures for the latter year show the weight only.]

In addition to them the following articles were imported in 1877–78 by numbers:—

Animals - - - -	26,666
Cows - - - -	1,433
Earthenware - - -	9,400
Cocoa-nuts - - -	61,836
Mats - - - -	3,484
Timber - - - -	95,299
Firewood - - - -	165,724
Bamboos - - - -	114,803
Horns - - - -	8

EXPORTS.

	Weight in Maunds.	Value Rs.
1877–78 - - -	*4,054,911	3,77,07,998
1876–77 - - -	6,088,785	4,81,56,310

*In addition, articles were exported by numbers as follows:—

Animals - - - -	10,520	Timber - - - -	55,465
Earthenware - - -	101	Firewood - - -	4,324
Cocoa-nuts - - -	178,379	Cows - - - -	16
Skins - - - -	396	Chineseware - - -	112
Mats - - - -	714	Leather - - -	36

IAP.I. Qn.17.
BERAR.
Ir. Dunlop.

The actual traffic by railway, the route by which the chief trade of the province is carried on is, was follows:—

IMPORTS.

1877-78.

			Weight in Maunds.	Value Rs.
			1,454,194	1,86,76,991
Animals	97	Numbers	*31,887	4,86,462
Cocoa-nuts	31,720

Total	-	5,375,003	4,49,34,564

The chief features of the trade of the province are exhibited in the following table, which is taken from the last Trade Report by the Commissioner, Hyderabad Assigned Districts :—

Articles.	Imports, Weight.	Exports, Weight.	Excess.		Remarks.
			Imports.	Exports.	
Sheep and goats - -	16,328	2,935	13,393	—	Mostly from the south.
Cotton - - -	188,144	1,699,739	—	1,511,595	Nearly all borne produce.
Twist and yarn, European -	51,709	11	51,698	—	All railway borne from the west.
Piece goods, European -	24,746	4,278	20,468	—	By far the greater part enters by Raja Deulgaon.
Do. Native - -	42,922	41,976	946	—	Imports chiefly from the east; exports to the south.
Wheat - - -	152,782	98,492	54,290	—	Imports 90,000 maunds, railway borne. „ 30,000 „ eastern frontier. „ 19,000 „ southern frontier. Exports 38,000 „ railway borne. „ 46,000 „ southwards.
Gram and pulse - -	10,718	—	10,718	—	All from the Narbada Valley.
Rice - - - -	270,873	25,048	245,825	—	Imports 216,905 maunds, railway borne. „ 44,004 „ eastern frontier. „ 174,000 „ railway borne. „ 31,879 „ eastern frontier.
Other rain crops - -	246,923	1,592,954	—	1,346,031	„ 23,434 „ southern. Exports 1,460,000 „ railway borne. „ 100,000 „ eastern frontier.
Hides of leather -	8,180	748	7,432	—	From the south.
Skins of sheep, &c. - -	30	119	—	89	
Horns - - -	2,966	5,721	—	2,755	Railway borne ; must be all produce of Berar.
Lac dye - - -	4,371	8,683	—	4,312	Import, railway borne; export, do.; difference must be Berar produce.
Brass and copper - -	3,472	1,738	1,734	—	Import from east chiefly.
Iron - - - -	—	—	—	—	No trade to speak of recorded.
Other metals - -	113,618	6,632	106,986	—	Import almost all by railway.
Oils - - - -	8,564	1,811	6,753	—	Import from south and west.
Opium - - -	3,963	3,276	687	—	Import 3,963 maunds, railway borne. „ 8 seers, southern frontier. „ 2 „ western frontier. Export 2,412 maunds railway borne. „ 330 „ eastern frontier. „ 534 „ southern frontier. „ 1 seer, western frontier.
Ghee - - -	14,362	19,685	—	5,323	
Salt - - - -	371,189	33,776	3 37,413	—	Export to east and south chiefly.
Silk, raw - - -	4,026	1,020	3,006	—	Import all by rail.
Spices - - -	20,252	2,512	17,740	—	Railway import 11,000 maunds, southern frontier 3,915, eastern frontier 3,791 maunds.
Sugar, refined - -	5,379	4,256	1,123	—	Nearly all imports railway borne, but refined and unrefined not distinguished.
Do. unrefined - -	191,569	2,345	189,224	—	
Tobacco - - -	4,314	19,135	—	14,821	Exports 9,262 maunds, eastern frontier.
Oil seeds - - -	64,720	333,763	—	269,043	It is impossible to distinguish the different kind of oil seeds with accuracy, so I have not attempted it: nearly all export was by rais. Imports came chiefly from the north and south.

BOMBAY.

Kaira.—Trade is brisk and the trading class energetic. Kaira exports grain, tobacco, ghee, oil, and timber. The Collector gives the grain traffic in 1876 as

	Tons.	
Exports - -	21,344	
Imports - .	1,432	(Probably rice for the rich.)

He estimates the export of tobacco at 7,292 tons. The recent opening of railway feeders has done much to develop trade. Kaira imports piece-goods, sugar, iron, timber, twist, and many other things.

Broach.—There is an active trade in raw cotton, the value of cotton exported in 1874 being 1,376,508*l.*, for preparing which there were 31 steam factories, *i.e.*, gins, presses, and spinning mills. Broach also exports wheat to Bombay and millet to Kattywar and Katch. The grain export was valued in 1874 at 25,245*l.* Broach imports gram, rice from Thana, metals, sugar, piece-goods, and timber. The gross imports in 1874 were valued at 616,177*l.*, of which 255,330*l.* was the value of commodities consumed in the district.

Surat.—There is a large export of raw cotton, timber, and grain, and import of metals and piece-goods. There are two spinning and weaving factories at Surat. The manufactures are common and fine cloth, silk, brocade, embroidery.

Thana.—The district is poor and the trading class insignificant. The exports are rice, salt, and timber. Thana grows its own food supply. The import trade is small.

Colaba.—There is not much trade and no energetic trading class. Colaba subsists on its own resources.

Khandesh.—Commerce not very brisk. The trade is chiefly conducted by merchants from Bombay, who have of late years established firms for the exportation of grain, cotton, and seeds, which form the chief articles of trade. Khandesh grows its own food supply and stores or exports a surplus. Timber is exported from the Dang forests. The imports are metals, cloth, and groceries.

Nasick.—Is an agricultural district. The grain trade is chiefly for local wants, but there is some export by rail to Bombay. The district grows much more grain than it consumes. The Collector mentions no other trade or industry.

Ahmednagar.—No information offered by the Collector. The products are (1) bajra, (2) joár, (3) oil seeds, (4) wheat, and a very trifling crop of cotton. The circumstances are probably the same as those of Nasick.

Poona.—There is no trade in the Poona district except in grain. The surplus over consumption is exported to Bombay, but not much wheat or oil seeds are grown and scarcely any cotton. The imports are metals, piece-goods, and salt.

Sholapur.—The Collector says, "trade is active "and the traders enterprising. There is a constant "flow of trade." But he does not say in what. Sholapur produces a trifling crop of oil seeds and a less one of cotton. The other products are chiefly millets, which are largely exported towards both Bombay and Madras.

Satara.—There is little or no commerce and no enterprising trading class. The grain is chiefly grown for consumption. Satara exports molasses, pepper, and a little cotton, and imports rice, salt, cocoanuts, and dried fish. The trade is with the coast.

Kaladgi.—Considering the isolated position of the district, the trade is fairly active. The cotton grown in the south part finds its way to the coast, and wheat grown in the valley of the Done is exported to Sholapur and elsewhere. In return come rice, salt, piece-goods, and silk. The produce of the silk and cotton looms in the south has a wide reputation, and the manufactures are exported into the Nizam's dominions and Madras. Except a few large firms, the traders only operate locally. Communications require to be improved. In the south and south-west large quantities of grain are stored in good years, because it would not pay to export it.

Dharwar.—Commerce is active and the traders energetic. The district supplies its own food in average years. Cotton is exported to the coast, but the carts return empty, and the imports are few. Grain is imported when prices are high.

Canara.—The traders are few, but well-to-do and fairly active. There is an export trade in areca nuts, cardamoms, pepper, and rice, and the imports are salt, grain, and piece-goods.

Ratnagiri.—Trade is active with the Deccan and with Bombay from the large towns and at the heads of the tidal rivers. The local trade consists in importing and distributing grain for consumption, and exporting salt-fish, shell-lime, and cocoanuts. No part of the district subsists on its own resources.

With reference to this question and question 3 above, the information of the Collectors as to disposal of the produce of their districts and the amount of imports consumed, seems vague and incomplete. The following tables may be of use. They show the export and import of food grains from and into the districts which are traversed by the railways in 1873 and the first half of 1874. This will be chiefly their own produce exported, and rice or wheat imported for the food of the wealthier classes, or common grain imported where the local production fails.

No statistics are available with regard to the traffic by road.

A difficulty arises in determining the standard of activity and enterprise by which the trading class of each district is to be tested. Most Collectors answer

MADRAS.

Board of Revenue.

the question in the affirmative, and it seems probable that some of those who have not done so have taken a different view of what constitutes activity and enterprise in a trading community. The experience of the late famine has tended to show most conclusively that, under very diverse conditions and most difficult circumstances, the ordinary traders of the country are able to organise and carry on an entirely new trade with very decided general success, and the Board consider that they are warranted in saying of the Presidency generally that it has an energetic and enterprising trading class. From the census tables of 1870-71 it appears that 3·4 per cent. of the male population were returned as engaged in trade. Many Collectors testify specially to the energy of the Mahomedan traders, and with regard to the Hindu commercial castes, Dr. Cornish, the compiler of the census tables, remarks: "They have not the whole field to "themselves; for many Mahomedans and Hindus of "other castes are now competing with them; but "they hold their own as communities possessing "capital, gifted with the spirit of enterprise and free "from the vice of personal extravagance, must always "do."

The proportion of traders to the male population in the different districts was as under:—

Ganjam - - - -	4·9
Vizagapatam - - -	4·2
Godavari - - -	4·0
Kistna - - - -	3·9
Nellore - - - -	4·3
Cuddapah - - -	3·4
Bellary - - - -	3·4
Kurnool - - - -	4·1
Chingleput - - -	2·3
North Arcot - - -	3·5
South Arcot - - -	2·2
Tanjore - - - -	3·6
Trichinopoly - - -	2·6
Madura - - -	3·4
Tinnevelly - - -	3·8
Coimbatore - - -	2·8
Nilgiris - - -	3·0
Salem - - -	2·3
South Canara - - -	2·4
Malabar - - -	3·3
Madras - - -	7·8

In ordinarily favourable years most of the districts of the Presidency subsist mainly on their own resources as far as regards the staple food of the population, but there is a steady ebb and flow as regards other agricultural produce, salt, piece goods, metals, &c. &c.

MYSORE.

MYSORE.

Traders always have been very active in this part of the country—there are numbers of the trading classes in all large towns. They are as a rule intelligent, energetic, and enterprising people, and they were quite equal to the occasion during the famine. Prior to the famine the trade in grain, cocoa-nuts, betel nuts, tamarinds, chillies, and jaggery, all of which are Mysore exports, was most brisk and encouraging, and the ebb and flow of trade was all that could be desired. The import of salt, iron, cotton, vegetable oils, ghee, and the precious metals was in those days very considerable, but during the prevalence of the famine, the whole character of the imports changed, and grain took the place of everything else.

RAJPUTANA.

RAJPUTANA.

ain Barr

Captain Barr, Marwar.—There is but little activity of commerce in this province. Marwar is well known as the birth-place and home of perhaps the most enterprising class of natives, but the Marwaris who enrich themselves by mercantile operations in other parts of India do not do much good to their native country. It is true that their love of home is strong, and that many of the wealthiest Marwari merchants, who have their places of business in Bombay, Calcutta, Malwa, the Deccan, Madras, and even in China, return periodically to Marwar, some to marry, others to give their sons and daughters in marriage, and many to end their days in their native country; but the energy and enterprise of these Marwari merchants is expended in other countries and the benefits of their habits are alienated from Marwar. The country itself has but little trade. Most of the districts are self-supporting, and it is only in years of scarcity that grain is imported. In years of unusual abundance grain leaves the country, but taking the average, it may be assumed that export and imports are small, and the ebb and flow of trade is neither active nor constant.

Major Powlett, Kotah.—Kotah has only two considerable resident merchants; but it has branches from large foreign houses. Its chief exports are grain and opium; and its imports English cloth and spices.

The same may be said of Boondee. But the latter exports more to the north; Kotah more to the south. In times of scarcity, notwithstanding engagements to the contrary, the export of grain is checked in all native states. It is, however, forbidden by Government so far as it directly affects the grain-supply of cantonments. Practically, less harm to outlying districts is done by the temporary restriction than would be supposed; for merchants in times of plenty establish stores of grain in British territory, whence they can be moved freely where wanted.

CENTRAL INDIA.

CENTRAL INDIA.

Mr. Winga

Bhopal.—A large export trade in opium, cotton, jaggery, and grain.

Baghelkhand.—No commerce except at Sutna, where salt and piece goods are extensively imported, and wheat, ghee, and linseed exported.

Rutlam.—Opium, cotton and oil seeds are exported to Bombay.

Bhopal.—A metalled and bridged road to G. I. P. Station at Etarsee. Carts are used in dry season, and at other times pack-bullocks.

CHAP. I. QN. 18.

CHAPTER I.—QUESTION 18.

What are the facts in your province as regards the means of communication? Do bridged and metalled roads connect all the important centres of trade that should be thus connected? Are the roads in good working order, and sufficient for the traffic on them or not? Are they open through the year, or closed for wheeled-traffic in the rains? Is the ordinary means of conveyance by wheeled carriage, or by pack-bullocks; and if by wheeled carriage, is there a sufficient number of carts in the district for all its wants? What is the ordinary cost per mile of conveying one ton of merchandise either by wheeled or by pack-carriage?

PUNJAB.

Major Wace.

PUNJAB.

I append a return of the roads in the province completed to 31st March 1878, which has been furnished by the Public Works Department. It shows that the total length of these roads was on that date—

	Miles.
Metalled and bridged - -	1,255
Partially " " - - -	664
Unmetalled - - -	20,030
Total -	21,949

The principal lines of road are shown in a skeleton map (scale 32 miles to an inch) which faces this report. It would not be practicable to show every road on so small a map.

Metalled roads.—The principal one commences at Delhi; and thence runs in a north-westerly direction through Lahore to Peshawar, traversing in its course the richest and most populous tracts of the province. Before the railways were constructed, this road was of the greatest value. And though the railways now relieve it of its heaviest traffic, it is still desirable to keep it up. Its total length is 579 miles. The next in importance are:—the road from Delhi to Sirsa, as yet only partially metalled, 165 miles; that from Delhi towards Mathra, 46 miles; from Amballa to Simla, 92 miles; from Ludhiana viâ Ferozepur to Lahore, 141 miles; from Amritsar to Pathânkot, 68 miles; and from Wazirabad to Sealkot, 30 miles. These roads are usually made of rammed kankar,* width and cost as noted at the end of this reply.

Unmetalled roads.—Each district is thoroughly intersected with roads of this class; and so far as the funds of district committees permit, they are bridged. The cost of construction and maintenance is small; and from the first years of our administration in the Punjab great attention has been paid to the connection of all places of importance in each district by roads of this character. Besides the roads thus returned, which are principally roads constructed and improved since annexation, there are great numbers of village roads all more or less suited to the local traffic. In short, so far as rough roads are concerned, those existing in every district much more than meet present local requirements.

Bridges and ferries.—The main rivers of the Punjab are of such width and volume, and their channels so shifting, as to make the erection of permanent bridges over them for the ordinary traffic of the country a task far beyond the present financial resources of the province. The place of such bridges is however efficiently supplied by temporary boat bridges on the main lines of traffic, and by ferries at the less important lines. The boat bridges are erected in September, and usually stand till April, May, or June, when they are dismantled. The rivers swell so greatly with the summer melting of the Himalayan snows, and the floods of the autumn rains are so high, that it is not practicable to maintain such bridges on the larger rivers between June and September. The traffic is slack in these months; and so much as there is, is ferried across in boats. As regards the bridging of the minor drainage channels of the country, it may be stated generally, that great progress has been made, and that the shortcomings still existing are not such as to cause any material hindrance to trade, nor can they be very rapidly supplied in the existing state of the local revenues.

Are the roads in good working order, and sufficient for the traffic on them or not? Are they open throughout the year, or closed for traffic in the rains?—The first of these two clauses may be briefly answered in the affirmative. It is not thereby meant that there is no room for improvement, nor desire to improve existing communications. On the contrary, both the Government and the District Committees pay continuous attention to the matter. But there is no part of the province in which any crying want exists, or which is not, roughly speaking, very well supplied with all necessary roads.

As regards the second clause, the roads may be stated roughly to be open throughout the year. The Punjab rains are not so heavy as those of Eastern and Southern India. Carts can work on the metalled roads all the year round; on the unmetalled roads also they can work, except for a few days after a heavy rainfall. Camels cannot work in rainy weather, their feet being unsuited for wet ground; they are also out of condition during the autumn rains, and it is consequently unusual to load them then.

Tolls.—The roads of the country are free of all tolls, except at the ferries and boat bridges on the larger rivers. Small dues are levied at these points; The proceeds yield a surplus over and above the cost of maintaining the boat bridges and ferries; which is added to the local rates paid by the landowners of each district, and aids in the maintenance of the roads. The only road toll-bars in the province are one on the hill road to Murree, and two on the hill road to Simla and its prolongation towards Tibet; all three entirely exceptional cases, justified by the great cost of these roads and by the exceptional benefits they confer on those who use them.

Is the ordinary means of conveyance by wheeled carriage or by pack-bullocks? and if by wheeled carriage, is there a sufficient number of carts in each district for all wants?—The ordinary means of con-

---

* Kankar is usually described as nodular limestone, and is a calcareous deposit plentifully found in beds some four or five feet below the surface of the land in loamy soils in most of the submontane districts. It forms a description of limepan, and the soil is greatly benefited by its removal. It is usually composed ¾ of carbonate of lime and ¼ of silica and alumina, in nearly equal proportions. (Ansted's Elementary Geology, p. 349.)

CHAP. I. QN.

PUNJAB.

Major Wac

veyance is by bullock-hackerie in the districts east of Lahore, and by camel in those west of Lahore.*

In the four western divisions of the province, (Rawalpindi, Peshawar, Multan, and Derajat), there is hardly any wheeled carriage; of 97,909 carts, only 2,789 belong to these divisions. On the other hand, the three divisions of Rawalpindi, Multan, and Derajat contain 120,117 out of the total estimated number (165,567) of camels belonging to the province. Camels are also largely used in the Hissar division, which possesses 25,589 of these useful animals.

There are no indications that the supply of carriage is insufficient. On the contrary, the camel drivers complain that they cannot get so much work as before, and attribute this to the development of the railways. Though reared, owned, and usually pastured in the dry western tracts of the province, they work much in the eastern districts; and no doubt, as regards these districts, the railways have largely supplanted them. In the hill districts of Hazara and Kangra the carriage is mostly by pack bullocks and mules. The statement appended, showing the carriage of each district, is taken from the Punjab Administration Report for 1876–7.

What is the ordinary cost per mile of conveying one ton of merchandise, either by wheeled or packed carriage?—The only wheeled carriage in the province of importance to trade are bullock-hackeries; the only pack-carriage, camels. I, therefore, confine my reply to these two descriptions of carriage. In a statement appended I have collected the rates charged on the most important roads in the province; but the rates charged by carriers depend so much on the dulness or briskness of local trade, that some discrimination is needed in applying the results shown in this statement. There does not seem to be any material difference between the cost of carriage by camels and by carts. The rates appear to vary generally between 1½ and 2½ annas per ton per mile. The higher rate and rates exceeding 2½ annas are more frequent on unmetalled roads than on metalled roads; but the schedule does not show so much difference between the charges on these two classes of roads as would have been expected. Some of the cheapest rates occur on roads which are railway feeders, where no doubt the demand for carriage is steady.

It is worthy of note, that the rates for carriage supplied by civil officers to troops (which were purposely fixed some years ago after considerable inquiry at rates more liberal than those usually paid by private employers), worked out to a rate per ton per mile, yield a rate of 3½ annas for bullock-hackeries, and 2⅓ annas for camels. I mention this as these rates are the outcome of an investigation entirely independent of that under report; and allowance being made for the higher rates necessarily paid for carriage supplied to troops, as well as for the fact that food grains are usually carried at the cheapest rates practicable, the results of the two inquiries fairly correspond.

Cost of roads.—The following details concerning the sums annually spent on roads in the province will be interesting in connection with this subject. During the three years ending 1877–8 the average sums spent each year on roads were:—

	Rupees.
On construction of new lines -	5,08,526
On repairs and maintenance of new lines - - -	11,02,269
Total -	16,10,795

Of this total sum Rs. 6,60,266 was spent directly from district funds by the district committees; and the balance, Rs. 9,50,529, was contributed from the general local fund and provincial revenue.

Metalled roads.—The road surface varies from 30 to 40 feet; of which from 10 to 16 feet are metalled; the most common width of metalling is 16 feet. The cost of construction varies largely according to circumstances. The roads with the heaviest traffic, constructed by the engineers of the Public Works Department, cost (omitting the larger bridges) Rs. 10,000 per mile.

The smaller roads and roads with less traffic constructed by district committees and civil officers cost from half to three-fourths of this sum. Repairs and maintenance cost on the former class of roads from 500 to 800 rupees per mile; on the latter they are usually less than Rs. 300 per mile per annum.

Unmetalled roads.—The cost of construction varies according to the amount of bridging required by the nature of the traffic.

The rough country road, which is ordinarily sufficient for the interior traffic of a district, can be well made for Rs. 300 a mile, and maintained for Rs. 30 a mile per annum. The better class of unmetalled road, carrying much traffic, cost from Rs. 60 to Rs. 300 a mile to maintain; the average annual charges on 15 such roads gives Rs. 120 per mile.

---

* To this statement I should note one exception. Carts, owned most of them by natives of districts east of the Ravi, work in great numbers on the metalled grand trunk road between Lahore and Peshawar.

NORTH-WESTERN PROVINCES.

NORTH-WESTERN PROVINCES.

Mr. Buck.

Roads.— A first-class road is one which is raised above the level of the country, bridged and metalled. A second-class road is one which is raised and bridged but not metalled, the roadway being on the ordinary soil of the country. But although classed as "bridged," most of these roads are interrupted by the larger rivers of the provinces, and the bridges are only over the smaller streams or watercourses which cross them.

For all roads which do not follow [illegible] of the main rivers, the streams of the Go[illegible]mna, and Betwa offer serious interrupt[illegible]

The Jumna is crossed b[illegible] at Allahabad, Delhi, and on the [illegible]ove Sahåranpur; at the two forme[illegible]re furnished with subways for[illegible]ic. Permanent pontoon bridges[illegible]at Muttra and Agra, and a t[illegible]s lately been constructed at[illegible]s crossed by railway bridges at Rajghát and at Cawnpore; at the latter place there is a subway for traffic. At all other points where roads of any importance meet the Jumna and Ganges, and at *all* points where such meet the Gogra and Betwa, a bridge of boats is only maintained during the cold and hot weather months, when the water is low. Above the Aligurh district such temporary bridges are very numerous across the Ganges, but below Cawnpore it is only bridged in this way at two or three places, the chief of which are Allahabad and Benares. The Gogra is not bridged at all below Fyzabad.

During the rains, therefore, most of the first-class roads are interrupted where they meet any of these rivers and traffic, and passengers have to cross by ferries.

The provinces are well provided with first and second class roads, except perhaps along the margins bordering on the Himalayan and Vindhyan hill ranges

IAP.I.QN.18.

NORTH-WESTERN PROVINCES.

Mr. Buck.

There is a third class of road, which includes roads unmetalled and unbridged, which are also maintained by Government. These are not shown in the map, but are in some districts very numerous and serviceable in fair weather. The character of the country in the Ganges Jumna Doab, flat and dry, except in the rains, allows of cart-traffic travelling along almost any kind of road, bridged or unbridged, for some seven or eight months of the year, and, though in the rains unmetalled roads may get swamped and unbridged roads blocked by streams, yet in no case is there such necessity for either bridging or metalling as in the damper tracts north of the Ganges and Gogra. Third-class roads are however better in the easterly districts, where there is less sand and the soil is firmer and more consistent than in those towards the westerly end of the provinces. The best metalling is made of kankar, a form of carbonate of lime, which occurs in irregular deposits, a few feet below the surface of the ground. Kankar is found in more or less profusion throughout the Doab districts, but is far less common in the damp and waterlogged tracts, where its need is most felt. In the sub-Himalayan districts its place is sometimes supplied with stones, broken small, generally obtained from the bed of some stream or mountain torrent. For this reason it will be noticed that first-class (or metalled) roads are far less common in districts in the two northern of the belts described in the answer to *query* 3, than in the southern belts.

The tracts which lie immediately under the Himalayas are much intersected by narrow streams called "*sots*," which always need bridging, as well as by torrent beds, dry during eight months of the year, but filled with rushing water in the rains, which, if a road is to be passable all the year round, must be also bridged. Nothing but the most solid and carefully constructed masonry can stand the violence of these torrent streams. Between the town of Najíbabad (in the Bijnor district) and Hardwár there are some 18 miles of road, on which the ruins of no less than six masonry bridges may be seen, which once spanned torrent beds, now impassable in the rains, though completely dry at other times.

The difficulty of using unmetalled roads in districts bordering on the Punjab, owing to the prevalence of sand, has been already implied. Their condition, if anything, improves in the rains, for the simple reason that wet sand is more consistent than dry. In Bundelkhund, and along the edge of the provinces which is fringed by the Vindhyan range, there are difficulties as great or greater than those in the sub-Himalayan tract. The torrents of the Betwa and other streams can in the rains only be crossed with great difficulty by means of ferries, the former river often almost completely cutting off the Lalitpur district from communication with the rest of the provinces. Another difficulty with Bundelkhund roads lies in the soil. The black earth known as "*már*" or "cotton soil" is common there, which in the rains becomes thick tenacious mire, making unmetalled roads running over it quite impassable, not only for carts, but also for pack-animals. The deputy commissioner of Jhánsi writes that even on unmetalled roads:

"Traffic is much hindered by the unbridged rivers, more particularly the Sindh, Betwa, and Dhasán, which in times of high flood are often impassable for days together. The earthwork of the gháts also is always liable to be cut away, making them very difficult for the passage of carts. The unmetalled roads in the district are practically closed for wheeled traffic throughout the rains, and those which pass through black soil are often impracticable for pack-bullocks."

It appears, therefore, that in the rains little or no traffic is possible in the tracts which lie near the Himalayan or Vindhyan hill ranges, for even the roads classed as bridged are there often interrupted by unbridged rivers or streams. In the districts which lie between those tracts, traffic is possible during the rains on fisrt-class or metalled roads with ease, where such do not meet any of the larger unbridged rivers at points other than Muttra, Delhi, Agra, Allhabad, or Cawnpore, and with difficulty when any of these rivers has to be crossed by ferry.

The means of conveyance vary with the character of the country. In the districts which lie along the centre of the provinces, bullock-carts (or "chakras") are most commonly used. The pattern on which these are constructed differs but little throughout these districts, and the load carried in them varies according to the number of bullocks and the class of road they are to travel over. The most usual loads average 10 or eight maunds for each pair of bullocks employed in drawing.

These carts go from 12 to 16 miles a day; at night they halt in camping grounds, which are set apart for this purpose at intervals along the more frequented roads. The charges for carriage are not, as a rule, calculated on the mileage with any pretence at accuracy. There is in each place a series of fixed fares to and from all other places with which there is much cart traffic.

The following are a few of the fares from Mainpuri:—

	Distance. Miles.	Rate per maund. Rs.	a.	p.	Per ton per mile. Rs. a. p.
To Etáwah	- 35	0	3	0	0–2–4
Farukhabad	- 40	0	3	0	0–2–4
Cawnpore	- 107	0	6	0	0–2–0
Mainpuri	- 310	1	0	0	0–1–5

The rates for carriage per ton per mile quoted in the district replies would all appear to be merely calculated from these customary fares, and vary from Re. 0-1-9 in Ghâzipur to Re. 0-3-9 in Jhánsi. Generally speaking, the fares are lower in the districts situated in the central belt, where metalled and bridged roads are common, than in the border tracts, where the communications are less favourable. In some districts they vary with the season and with the class of road to be travelled over; thus in Jhánsi the usual rates are given as Re. 0-2-6 for metalled roads and Re. 0-2-9 for unmetalled, which in the rainy season are raised to Re. 0-3-6 and Re. 0-3-9 respectively. The average rate for cart carriage may then be put at Re. 0-2-7 per ton per mile.

From the district replies it appears that in each district there are enough carts for ordinary transport purposes. Their numbers are, however, considerably diminished by every new line of railway which competes with the roads they ply on. The collector of Jaunpur writes on this subject:—

"I am informed that the introduction of the railroad has had the effect of diminishing the number of carts. Last year, when traffic was choked at Benares, I inquired of some merchants who wished to send grain towards Bombay why they did not take it in carts to Allahabad, and was told that carts could not be obtained."

Not only is the cost of carriage by cart very much in excess of that by rail, but there are numberless risks from which goods carried by rail are free, and must be held to add to the total expense. Besides the risk of loss from exposure to the weather, from theft, or the dishonesty of the cartmen, there is another danger arising from the length of time taken in the journey; prices may change, and a sudden fall may ruin the venture altogether.

As stat[illegible]fore, the conveyance of goods on pack anima[illegible]nest on the borders of the provinces. To[illegible]b, where the ground is sandy and car[illegible]difficulty, camels are not uncommon, wh[illegible]om the Punjab and Rajputana to th[illegible] the Meerut division. In this pa[illegible]nkeys are also commonly employed [illegible]l trade, each animal carrying a[illegible]llocks are the means of con-[illegible]jārás, the itinerant grain and [illegible]India. These men do some

NORTH-WESTERN PROVINCES.

Mr. Buck.

trade with the Bundelkhund districts, and in them bullocks are the pack-animals most commonly used. Bullocks are employed, but less generally, throughout the provinces, the rates per ton per mile given by district officers varying from Re. 0-3-0 (Jhánsi) to 0-4-4 per mile.

On the Nepal and Kumaun frontier ponies are the pack-animals chiefly employed. The collector of Gorakhpur states that pack bullocks or buffaloes are but little used, and estimates the rate for pony carriage as Re. 0-4-0 per ton per mile. When the carriage is in the Hills themselves the rates are greatly increased, and the labour of coolies is much employed. The Dára pass leading into the Gonda district is only practicable for coolies, and in Kumaun and Garhwál coolies, with mules and ponies, are the ordinary means of conveyance, the estimated rates being Re. 1-3-0 per ton per mile for the latter and Re. 1-7-0 the former.

Sheep are employed in carrying goods between Kumaun division and Thibet, being the only pack-animals which can be used with safety in crossing the difficult snow passes.

The following are the average loads carried by each of these different means of conveyance:—

Bullock-cart - -	10 mds. to 50 mds.
Camel - - -	5 "
Buffalo - - -	5 "
Bullock - - -	3 to 4 "
Pony - - -	3 "
Donkey - -	2 "
Coolie - - -	1 maund.
Sheep - - -	10 seers.

BENGAL.

BENGAL.

Mr. Toynbee.

The state of communications in the province by rail and river has been fully explained in the answers to questions 19 and 20. As regards roads, it will be best elucidated by a reference to the accompanying statement. It will be seen that the number of "all-weather," or "bridged and metalled," roads is but small compared with the mileage of "fair-weather" roads. The physical conditions of the province render bridging and metalling impossible to any large extent, not only on account of the original expense that would be incurred in their construction, but also by reason of the heavy cost of maintenance. Roads in Bengal are, generally speaking, feeders to rail or river. The traffic on them is greatest in the dry months, after the great winter rice-harvest of the year has been gathered in and threshed out, so that metalled roads are not required for any but the principal routes. For pack-bullocks and ordinary carts, the ordinary "fair-weather" road is all that is necessary. Since the introduction of the Road Cess Act the funds collected under its provisions are spent solely and entirely within the district which provides them. Each district has its own engineer and subordinate engineering establishment working under the general control of the district officer. The result has been that new roads have been made in every district strictly in accordance with its own wants, and by degrees no part of any district will be left unprovided with such communications as will ensure the full and free flow of such inward and outward traffic as the conditions of the season may demand. In the hilly portions of the province, and in such parts of the interior as have not yet been provided with roads, the traffic is chiefly by means of pack-bullocks; whenever there are good roads and near large towns it is by cart. The number of carts always increases with the increase of facilities of communication. Pack-bullocks and carts together, each district has quite enough for all its ordinary requirements. It would not, of course, be possible to keep up a reserve of either to meet any extraordinary pressure. The experience of 1874, which is a very extreme case, shows that means of transport are always forthcoming when they are wanted. On a rough estimate, the cost per mile of conveying one ton of merchandise by cart ranges from three to four annas, and by pack-bullocks from one to two annas. These are the rates charged to outsiders; to those who carry their own grain to market by means of their own carts or bullocks the cost would, of course, be merely nominal.

CENTRAL ROVINCES.

r. Nicholls.

CENTRAL PROVINCES.

In the following districts the ordinary means of conveyance is by wheeled carriage; and there is a sufficient number of carts for all ordinary wants:—

Nagpur.
Wardha.
Bhandara.
Seoni.
Chhindwara.*
Nimar.
Hoshangabad.
Narsinghpur.
Saugor.

In Betul, Damoh, and Jubbulpore there appears to be a considerable deficiency, but in many parts of Damoh and Betul, perhaps also in Jubbulpore, carts cannot get about the country.

In Mandla and the uplands of Balaghat, carts are almost unknown. In the low lands of Balaghat, in the Wainganga valley, the country is very well supplied with carts.

Chanda shows a very great number of carts, but it is believed that these are mostly in the country on the west of the Wainganga. The east of the district is very wild, and the roads were such that the length of a journey would, not long ago, be described by the number of spare axles which would be sent with a cart to provide for breakages.

---

* Aided by the carts of other districts and pack-bullocks.

But carts for driving purposes and for the carriage of goods are extensively made, as may be gathered from the fact that the value of those sold at the Chanda fairs during 1865-66 amounted to Rs. 3,38,700. During the year 1877-78, for some weeks considerably over 36,000 carts paid toll every week on the eastern road in the Bhandara district. A considerable portion of these belonged to Nagpur and Kamptee, and still more to Chhattisgarh. But the wonderful activity in cart making in the Bhandara district, where last year it was very difficult to get a carpenter to look at any other sort of work, seems to prove that, even aided by Nagpur and Bhandara, there are not sufficient carts in Chhattisgarh to meet the requirements of its ordinary trade, and apparently the carts which belong to the districts are almost confined to the west of the district.

The trade from Chhattisgarh towards the south, the eastern coast, with Ranchi and Mirzapur and Jubbulpore, is carried on by pack-bullocks.

The east of Raipur and Bilaspur are similar to Sambalpur, for which the deputy commissioner has given me the following account:

> "Mr. Russell, who has long been Settlement Officer here, writes 'that every village possesses 10 or 12 small carts with wooden axles and roughly made block wheels, not always quite round.' A smaller estimate of six to each village in the feudatory states gives the following numbers for the whole district:—
>
> Khalsa and non-feudatory zemindaries for 1,710 villages - - - 17,100
> Feudatories 4,597 villages - - - 27,582
>
> 44,682
>
> "Out of this large number there are perhaps not 50 which are used for exporting and importing goods. They are kept almost exclusively for agricultural purposes. The reason why they are used only to a limited extent is that the carts are very small and fragile,—the bullocks diminutive, and ill fed, and consequently weak. The average load of a cart is six maunds, and the length of journey per diem about eight or nine miles. The capabilities of the carts I have myself tested; for during the past marching season I employed some, and found that it took two to carry a single pole tent weighing 13½ maunds. As long as the marches did not exceed eight or nine miles they did fairly well, though they took longer in getting over the journey than buffaloes; but on my having to do 14 to 16 miles a day the bullocks on the second day broke down completely, and the only way in which I could prosecute the journey was by pressing fresh ones in the villages on the road. Taking every thing into consideration, I am of opinion that the wheeled carriage of this district is not sufficient for its ordinary wants, because it is not capable of being used with profit for carrying the export and import trade, and this opinion is fully borne out by the fact that ganjam and cuttack carts, together with pack-bullocks, are exclusively used for this purpose when goods are taken by road. Should a famine occur such as would necessitate the importing from long distances of considerable quantities of food grain, it is my opinion that the wheeled carriage would be only useful in distributing grain brought to depôts by other means of conveyance, and that it would be useless to expect the carts to be available for the work of importation. The cost of carriage per ton per mile may be put down at 5½ annas."

Chap. I. Qn. 15.

Central Provinces.

Mr. Nicholls.

Whatever may be our shortcomings in the way of carriage, what we have has been sufficient to block up all the railway stations in the provinces, the railways being quite unable in a time of pressure to remove it fast enough.

Question.—What is the ordinary cost per mile of conveying one ton of merchandise either by wheeled or by pack carriage?

Answer.—It was recently calculated that the cost on the Great Eastern road of the conveyance by carts was 2¼ annas a ton per mile. Where grazing is abundant and time no object, it is believed that the rates for conveyance by pack-bullocks would be generally lower. There are also parts where only pack bullocks or buffaloes can be used.

The following rates have been supplied to me:—

	By carts.	By pack-bullock.
Sambalpur - -	5½ annas	—
Nimar - -		
Chhindwara - -	4½ "	—
Narsinghpur - -	4 "	4½*
Saugor - -	3¼ "	—
Wardha - -	3 "	—
Bhandara - -	2¾ "	2¼
Balaghat - -		
Seoni - -		
Raipur - -		
Nagpur - -	2 "	—

The difference of rates in the Jubbulpore district is very great. I give the reply furnished by the deputy commissioner for each tahsîl:—

> *Tahsîl Jubbulpore.*—"The hire per maund per mile is 3 pie, hence the cost of conveying one ton of merchandise comes to 7 annas, either by wheeled or by pack carriage. Ordinarily a pack bullock or pony can carry 2 maunds, and a cart with 2 bullocks 8 maunds. The hire of a cart is 15 annas per diem, and that of a bullock, including the driver, is 6 annas a day; the cart or bullock can travel 12 miles a day.
>
> *Tahsîl Sihora.*—"One ton of merchandise can be conveyed at a cost of 5 annas and 6 pie by pack-bullocks, but would cost 4 annas a mile if conveyed by wheeled carriage. A pack-bullock can carry 2 maunds and 20 seers, and a cart drawn by 2 bullocks will hold 15 maunds. The daily hire for a cart is Rs. 1-8-0, and for a bullock 6 annas; carts and pack-bullocks can travel 15 miles a day.

Tahsîl Murwara.—"The cost of conveying one ton of merchandise per mile is 2 annas 6 pie by cart, and 3 annas 6 pie by pack-bullocks; a cart can convey 14 maunds, and can travel 12 miles per diem; a pack-bullock can carry 2 maunds, and travel 12 miles. The hire of the former is 15 annas a day, and that of the latter is 3 annas."

Major May.

Means of communication.—The means of communication in these provinces are, on the whole, at present unsatisfactory, but yet the province has many general advantages.

Connection of centres of trade.—The centres of the grain trade may be said to be, (1) Murwara, (2) Jubbulpore, (3) Saugor, (4) Gadarwara, (5) Harda, (6) Khandwa, (7) Mandla, (8) Hinganghat, (9) Nagpur, (10) Kamptee, (11) Toomsar, (12) Dongergarh, (13) Raipur. Of these, 1, 2, 4, 5, 6, 8, and 9 have railway communication, 10, 11, 12, and 13 will be connected with a railway in about two or three years,

---

* Buffaloes are mostly used instead of pack-bullocks in the Narsinghpur district.

IAP.I.QN. 18.

CENTRAL 'ROVINCES.

ajor Mayne.

and 3 and 7 are connected with a railway by bridged and metalled roads.

Condition of roads.—The bridged and metalled roads are maintained in a condition to be open for traffic throughout the year. Others are difficult to traverse during the rains, but generally for $7\frac{1}{2}$ months in the year, or from the end of October to the middle of June, are available for traffic without much difficulty. Portions of the Great Indian Peninsular with East Indian and Holkar State Railways traverse the province, besides the Wardha Valley State Railway, making a total of about 530 miles of railway within the limits of the province. Of ordinary roads, this department now maintains about 900 miles of metalled and bridged roads, 120 raised, bridged, and unmetalled, and 250 neither raised nor bridged. Besides these, numerous district roads exist, some of which are raised and bridged. Water communication exists in the Upper Godavari district by means of the river Godavari, and I believe it also exists in Sambalpur district by the river Mahanadi.

In the black cotton soil districts the country may be said to be closed for wheel traffic during the monsoon, or for $4\frac{1}{2}$ months in the year; and in cases of distress from famine, the difficulties and cost of carriage of grain over such tracts would be enormous.

Ordinary means of conveyance.—Wherever roads are constructed and maintained, wheeled carriage at once takes the place of the pack-animals. At present, a very large portion of the traffic is carried by means of the latter. Between the two, *i.e.*, the wheeled carriage and pack-animals, there is an enormous quantity of carriage available.

Cost of carriage per mile per ton.—The cost of carriage by cart or pack-animals has risen of late years. The demand has been greater on account of the large development of the grain trade, and expenses are heavier. On the metalled roads, carts will carry about $\frac{3}{4}$-ton, and travel from 10 to 15 miles a day. In the last trading season, the hire of a cart was Rs. 22-8-0 per mensem or 12 annas a day. This would bring up the cost (at 12 miles a day) to about 16 pies per ton per mile.

Pack-bullocks carry about $3\frac{1}{4}$ maunds or $\frac{1}{8}$ of a ton from 8 to 10 miles a day, over mere tracks. One man takes care of about 20 cattle. What their actual cost for feeding is I cannot say, but I understand that in some places now the malguzars (more alive to their own interests than formerly) charge grazing fees on cattle feeding on their estates. The cost of carriage, whether by wheeled conveyance or animals, is, I imagine, much the same, as far as expenses go, but less capital is required for carts, as in these two bullocks will draw $\frac{3}{4}$-ton, whereas that quantity would require six pack-bullocks.

BERAR.

Ir. Dunlop.

BERAR.

A few years ago a scheme was sanctioned for supplying the province with a complete net-work of second-class roads, and this is now gradually being worked out.

The Amraoti and Akola districts are already well furnished with roads. In Basim, Wun, and Buldana some important lines are under construction.

The roads are not all completely bridged, but they are generally sufficiently so for the traffic that is on them. The rivers that are unbridged seldom remain in flood for any length of time, and during the rains a delay of a few hours is all the inconvenience that cartmen occasionally experience. In addition to second-class roads, third-class roads, viz., fair-weather tracks, are kept in repair.

The supply of carts is sufficient for the ordinary requirements of the province, but there is no surplus supply.

The deputy commissioner of Amraoti could not recently find any one to contract for the supply of 150 carts for carriage to a regiment about to march from Ellichpur to Aurungabad. Traders, however, find no difficulty in getting their general requirements in this respect supplied. Many of them make carting contracts for the season.

A great improvement has taken place in late years in the style of cart in use, the old Berar cart, capable of carrying only 10 maunds, being gradually replaced by the Madras bandy, which carries 15 maunds.

In the Ellichpur district the cost of carrying one ton is said by the deputy commissioner to be three annas per mile, each cart carrying half a ton. In the Wun district it is said to be four annas a mile, and in the Amraoti district from four to six annas. In the Akola district it is six annas on the average, but the trade rate varies considerably at times.

BOMBAY.

Colonel 'nkin Jones.

BOMBAY.

The province is well supplied with metalled and moorum roads. In the central division the roads named are bridged and metalled:—

Poona viâ Sholapur as far as Tandulwaree, Nizam's frontier.

Poona viâ Ahmednagar to Toka.

Poona to the foot of Bhore ghaut towards Bombay.

Poona viâ Satara to the Kolhapur State, near the Warna river.

Barsee Road station viâ Barsi to Yedsi.

Kurrar to Chiploon by the Koombharlee ghaut.

Soorool on the Poona and Satara road, viâ Waee to Mahableshwur.

Nearly all the rivers on these roads are bridged, except the Warna, on the Satara and Kolhapur road, where a masonry bridge is being built; the Bhima river at Koregaum, on the Poona and Ahmednagar road; the Bhimá and Seená rivers, on the Poona and Sholapur road. Flying bridges are, however, provided for these river crossings.

In the northern division the old Bombay and Agra road extends from the foot of the Thull ghaut to the frontier of Khandesh. There is a bridged and metalled road from the Munmar railway station to Dhoolia, which, with the exception of the Girna river, is bridged and drained throughout.

As a general rule, all the rivers and nullas south of the Tapti are passable for traffic during the rains, except the Girna. Carts may be detained by floods, but the water soon runs off. The Girna is also passable at ordinary times during the rains, but for a fortnight or more can only be crossed by boats. From the beginning of the rains to the end of November the Tapti can only be crossed by boats.

Besides the above-mentioned roads there are many moorum roads more or less bridged and drained, besides fair-weather roads connecting the taluka stations of the different collectorates.

The roads are in good working order. The metalled roads are open throughout the year, and so also are the moorum roads, the large rivers still unbridged being crossed by flying bridges or ferry-boats.

The ordinary means of conveyance are chiefly wheeled carriages, but in parts of the Satara and Kandesh collectorates bordering on the Ghauts pack-bullocks are also employed.

There is a sufficient number of carts and bullocks.

Conveyance per ton by wheeled carriage averages from two to five annas per mile, and by pack-bullock something more.

No new lines suggested.

From the main artery of communication from Poona south through Satara, Kolhapur, Belgaum, Dharwar, Hooblee, and Hurryhur, six first-class bridged, drained, and metalled roads communicate with ports on the western coast.

Of these six roads two between Poona and Kurrar have no connection with the southern division. The third is situated about 30 miles north of the Warna river, the northern boundary of the southern division. It connects the mail road with the busy port of Chiploon, and though outside the southern division a large portion of the trade of the division is conveyed over this route.

The next first-class road connects Belgaum, 118 miles south of Kurrar, with the port of Vingorla. The remaining two first-class roads connect the town of Hooblee, 12 miles south of Dharwar, with the ports of Karwar and Coompta.

In addition to these first-class roads there are others, fair-weather roads only, not being completely bridged and drained or metalled, which connect the Deccan with the Konkan. These roads cross the Sahyadri range at the Phonda and Tini ghats. The Phonda ghat lies between Kolhapur and Belgaum, and is connected with the Poona mail road at Kolhaphur and due east at Neepani. Of these two connecting lines that from Kolhapur to Phonda is a fair-weather road partially bridged and drained. The other road is a secondary fair-weather road, unbridged and undrained. The Phonda ghat is a good mountain road, metalled and completely drained, and from its foot four unmetalled roads communicate with the coast at Rajapur, Wagotun, Deoghur, and Malwan. That to Deoghur directly west is the only road bridged and drained. But this line is little used, the trade, as of old, going to Rajapur, the chief town in the Ratnagiri district, and to Malwan.

The Tini ghat is a pass on the mountains due west of Dharwar. This route passes into the Portuguese territory of Goa. The road is partially bridged and drained, and is unmetalled.

Another road of communication between the Deccan and the coast by the Amba ghat, which lies west of Kolhapur, is now under construction. The ghat road will be completed in 1879–80, and likewise the connecting roads to Kolhapur and Ratnagiri. This line will be completely bridged and drained, and will be open at all seasons to wheeled-carriage traffic.

The centres of trade, so far as the mail road connecting Kolhapur, Belgaum, and Dharwar with Poona, are thus in communication with ports on the coast, and cart traffic is not suspended during the south-west monsoon by the (1) Chiploon and Karar; (2) Vingorla and Belgaum; (3) Karwar and Dharwar; (4) Coompta and Hubli roads by reason of the inefficiency of the roads themselves. All these roads are open to traffic at all seasons of the year; but as the ports are virtually closed during the south-west monsoon, there is little cart traffic between July and September. Karwar is a small port, and gives little shelter during the south-west monsoon; but there is very little trade there at that season, as native craft do not ply, and ships, excepting those of the British India line, on their way to and from Calcutta, are very shy of venturing near the western ports on a lee shore.

When the Amba ghât road is completed, and a connection is made with Meria Bay at Ratnagiri, a small amount of shelter may be obtained at that port during the south-west monsoon. Practically the western coast is closed at this season; and if it had safe harbours, trade would be very slack on account of the very heavy rainfall in the Konkan and on the Sahyadri range. Twelve feet of rain in the Konkan, and 16 to 20 feet on the mountain, between the 1st of June and 1st of November, is an ordinary rainfall in those parts, and few articles of trade could encounter such wet weather and dampness without deterioration.

During the famine of 1877 cart traffic traversed the roads mentioned the whole of the wet season. The famine was the cause of immense quantities of grain being shipped during the open season to Compta, Karwar, Vingorla, and Chiploon, which were not conveyed up country before the wet season set in. The coast traders accordingly had their grain carted during the wet season; and as vast numbers of the cattle of the Deccan had died, this traffic was continued with human draught to the bullock-carts. The carts drawn by men were very destructive to the roads, for, as in the ordinary way seven bags of grain make the load for a pair of bullocks (about half a ton), the traders paid the cartmen by the trip for the loads; thus in their eagerness for a good return for their labour, the cartmen used to carry double loads.

Kaira.—Mr. Porteous says: Nariad, Dakor, and Wassad, three of the principal centres of trade, are all on the railway; and Kapadwanj, another trading centre, is connected by a good road with Dakor.

The country to the west of the B. B. and C. I. Railway is not, in my opinion, sufficiently provided with roads. The very rich taluk of Borsad has only one road, that connecting it with Wassad railway station.

Those roads which do exist are open throughout the year, and they are sufficient for the traffic which at present uses them.

In the open season there are numberless cart tracks; every village almost has its cart track to neighbouring villages or to the nearest roads, but these tracks are closed to all wheeled traffic in the monsoon. It is of importance to recollect this in connection with the condition of the country to the west of the railway. There is a very dense population in Borsad, and for at least three months in the year the whole of it, except the considerable fraction inhabiting the taluka town itself, and three or four villages on the road thence to Wassad, can import or export nothing except on pack-bullocks. I saw a great deal of the taluk in May and June of this hot weather; and I am convinced that if famine ever threatens this district, one of the first things to think of will be the best means of making the Borsad taluk less inaccessible in the monsoon. Unfortunately the taluk is so interlaced with foreign territory (Baroda and Cambay) that unless these states co-operate, Government would have to provide Baroda and Cambay ryots with roads by the very act of providing them for our own people.

Thana.—The three lines of railroad and the Agra road, and the road from Poona to Panwell, afford the chief means of internal communication. There are but few other roads in the district, and they may be said to be confined to the Salsette and Panwell talukas; short roads, constructed from local funds. The centres of trade are Bhiwandi and Kalyan. Both are easy of communication with Bombay and Thana by water, and a good metalled road runs between Bhiwandi and Thana, and Bhiwandi and Kalyan. The former is the Agra road, which is cut in two by the unbridged Thana creek. The latter runs to the Kalyan creek, on the farther bank of which the town of Kalyan is built. The creek is unbridged. Road communication along the coast is quite wanting, and in the interior it is confined to rough cart tracks, constantly intersected by streams and rivers. A moorum road (unbridged) is now being made between Kalyan and the Malsej ghat, leading into the Poona district. Between the principal stations on the B. B. and C. I. Railway and the larger villages on the coast there are generally railway feeders constructed from local funds, but the whole interior part of the district is destitute of roads, except common cart tracks, which are made passable for the fair season, where serious difficulties are found, by such expenditure annually as the local funds can afford. The ordinary charge to traders for carriage by cart and by pack-bullocks

CHAP. I. QN. 18.

BOMBAY.

Major-General Wilkins.

is as follows: from 12 annas to 1 rupee per cart per day; from 4 to 8 annas per day per pack-bullock.

Khandesh.—Khandesh, as compared with other provinces, is certainly well off as regards means of communication, The G. I. P. Railway passes through the district from south-west to north-east for about 135 miles.

Bridged and metalled roads have been constructed from many of the railway stations to the nearest centres of trade. A list of metalled roads is appended:—

Bombay-Agra road (74 miles), passing through the Dhulia, Virdel, and Shirpur talukas.

Dhulia-Chalisgaon road (34 miles), leading to the first railway station in Khandesh, viz. Chalisgaon.

Dhulia-Surat road (about 24 miles finished, the rest in fair order), passing through the Dhulia and Pimpalner taluks.

Dhulia-Erandol and Mhasawad railway station road (45 miles), passing through the Dhulia, Amalner, and Erandol taluks.

Jalgaon-Neri road (20 miles), passing through the Jamner and Nasirabad talukas.

Songir-Nandurbar road (24 miles completed), passing through the Dhulia, Virdel, and Nandurbar taluks.

Bhadgaon-Pachora road (9 miles), connecting the town of Bhadgaon with the Pachora railway station.

Sauda-Gata road (3 miles), railway feeder.

Erandol-Dharangaon road (6 miles), connecting the towns of Erandol and Dharangaon.

Parola-Kajgaon road (24 miles), leading to the railway station of Kajgaon.

Many important centres of trade, though not *all*, are connected by means of the above roads. Annually, some new lines of communication are taken in hand as funds permit, and it is hoped that under the new five years' budget system recently introduced by Government all important communications will eventually be provided for.

The roads are sufficient; in fact, in the fair weather, traffic rather avoids the made roads, in order to escape paying tolls.

Ahmednagar.—Considering the size and importance of the district, it must be said that road communication is very defective, but a decided improvement has taken place within the last two years. There is only one bridged and metalled road, namely, that to Poona, which is by no means of the highest commercial importance. The roads connecting the principal towns and marts with Nagar itself are good enough for fair weather, but they are mostly impassable in the rains.

Kaladgi.—The means of communication in the district are about as bad as they can be. There are two main roads leading into the district—one from Sholapur to Hubli in the Dharwar district, going right through the district from north to south; the other from the coast and Belgaum to Bagulkot, the chief town in the district, and then extending on to Hungund, another town. This last road intersects the district south of the Krishna, and runs from west to east. On these two roads the principal export and import traffic goes on. They are provincial roads; but only so in name. The first (the most important one, as leading to the railway) has not a bridge, drain, or culvert on its whole length; the last has a few drains and culverts. Neither of them is much better than country cart tracks, and as soon as the heavy monsoon rains set in they become absolutely impassable for wheeled traffic, so that the district becomes quite isolated. There are a fair number of local fund roads in the district, many of which are in better order than the provincial ones; but they do not lead out of the district, which is the great want. As far as I can judge, literally nothing has been spent out of provincial funds in this district in comparison to what has been spent in other places, whilst as a paying district it is one of the best.

There is not much traffic by pack-bullocks—individual petty traders keep a few, but there are no large herds kept by wanjaras and lamanis, as in some parts of India. Carts are the chief means of conveyance. There are sufficient of them. Cost per ton per mile $2\frac{2}{3}$ annas.

SINDH.

Col. Haig.

SINDH.

The province is well supplied with roads, which are for the most part bridged, but none are metalled. In North Sindh a rude description of cart is employed, but throughout the province generally the camel is the means of conveyance. Thus unmetalled roads suffice for existing needs of traffic, and they remain open throughout the year, except when floods occur, in which case metalled roads would be equally useless. *An increased employment of carts is greatly to be desired for the province, but a better kind of vehicle than that in use in North Sindh is also a desideratum.* The ordinary cost of conveyance of goods is—

By cart—4 annas per ton per mile.

By camel—2 annas 8 pie per ton per mile.

MADRAS.

The Board of Revenue.

MADRAS.

It may be said generally that the road communications of the presidency are satisfactory. Bridged and metalled roads do as a rule connect all the important centres of trade, and are in good working order and sufficient for the traffic on them, but it must be understood that the Board do not mean to say that there is not room for improvement by the addition of more bridges and more thorough metalling. There are also many fairly important trading localities which have only gravelled roads, and for which metalled roads would be highly desirable, as the facilities afforded by the gravelled roads would be severely strained by any unusual accession of traffic. As a rule, however, there is but little to complain of with regard to the roads in the Madras presidency. They are generally open to traffic all the year through, but in places where the bridging has not been completed, or where a bridge has been carried away and not yet replaced, there would probably be an interruption to traffic during heavy floods, but in the case of an emergency arrangements would very soon be extemporised for overcoming a difficulty of this kind occurring between any important centres of trade. When roads pass over black cotton soil those that are not metalled are often impassable in very wet weather, but it is only in Bellary that the facilities for traffic are affected in this way to any great extent, and the important centres are reported to be connected by metalled roads. From Canara, where the rainfall is always over 120 inches, it is reported by the collector that the roads are closed to wheeled traffic during the rainy season for want of bridges over rivers or streams by which they are crossed, but with reference to this it must be borne in mind that, even if the roads were bridged throughout, there never would be any active traffic during the height of the south-west monsoon; and the district engineer, arguing from practical experience during the last monsoon, is of opinion that it can hardly be said that the roads are altogether closed

CHAP. I. QN. 18.

MADRAS.

The Board of Revenue.

in the rains. It may be added that such a thing as a famine has never been known in Canara.

With reference to the Kistna district only is it reported that the roads are in a generally unsatisfactory state. The collector writes: "The means "of communication by road are very indifferent. "Bridged and metalled roads are the exception; "existing roads are not in good working order, nor "are they sufficient for the traffic. The non-metalled "roads are virtually closed to wheeled traffic during "the rains." As a set-off against this, it is to be borne in mind that there is canal or river communication between the chief centres of trade; that the rainy season, during which the roads are virtually closed, is of very limited duration; that the ordinary cost of carriage per ton by road is by no means high, viz., annas 3–6; that it has not been considered necessary to raise the local taxation for roads so high as in most other districts of the presidency, though the people could well afford it, and that the collector answers question 21 in the negative.

Except in the hill tracts of Ganjam and Vizagapatam and parts of the districts of Malabar and Canara skirting the western ghâts, wheeled carriage is the rule throughout the presidency, but wherever there are hills there are pack-bullocks supplementing the wheeled traffic. Where wheeled traffic is the rule, sufficient carts are forthcoming for all the ordinary wants of the district.

The following table shows the number of miles of road in each district, and the average ordinary cost per mile of conveying one ton of merchandise. It will be observed that the rates are singularly high in Malabar, and singularly low in Salem. In Malabar, where money is abundant, everything is dear, but with regard to Salem the only explanation which occurs to the Board is that there is a mistake in the collector's report, which states that a cart carries "1⅝ of a ton at an average rate of 1½ annas per mile." A cart-load is usually taken to be about half a ton.

District.	Area.	Miles of Road.	Cost of conveying one Ton.	
			Wheeled.	Pack.
	Sq. Miles.	Miles.	Rs. A. P.	Rs A. P.
Ganjam (excluding the hill tracts)	2,598	820	0 2 4	—
Vizagapatam do.	5,303	632	0 2 0	—
Godavâri	6,224	702	0 4 0	—
Kistna	8,036	774	0 3 6	0 3
Nellore	8,462	740	0 3 2	—
Cuddapah	8,367	879	0 4 0	0 8 0
Bellary	11,007	1,452	0 2 10	—
Kurnool	7,358	441	0 3 0	—
Chingleput	2,753	706	0 3 0	—
North Arcot	7,139	1,160	0 3 0	—
South Arcot	4,873	1,169	0 3 6	—
Tanjore	3,654	1,390	0 3 6	—
Trichinopoly	3,515	533	0 4 6	—
Madura	9,502	993	0 3 2	—
Tinnevelly	5,176	828	0 4 6	—
Coimbatore	7,432	1,364	0 2 4	—
Nilgiris	749	240	0 8 6	—
Salem	7,483	1,445	0 0 11	—
Canara	3,902	806	0 5 0	0 8 0
Malabar	6,002	1,617	0 7 5	1 4 1
Total	119,535	18,691	—	—

The areas given above exclude the hill tracts of the districts of Ganjam and Vizagapatam. With reference to the latter, the collector writes: "The "rugged tracks used by the trains of pack-bullocks "are being smoothed, causeways are being made "across morasses, and wooden bridges over some of "the minor streams. The country produces all that "is needed for its sparse population." The same may be said of the other hill tracts.

MYSORE.

MYSORE.

Captain Bowen, R.E.

The only means of intercommunication in the province are by roads—the Madras Railway traversing only the few taluks due east of Bangalore.

All the important centres of trade are connected by good bridged and metalled roads. The majority, however, of the cross or local roads are unmetalled, and but partially bridged. Nevertheless, they are practically closed to traffic but for very short periods during heavy rains. The local roads intersected by the Cauvery, Toonga, and Budra rivers are exceptions to this statement, these rivers during the monsoon being often impassable for days together. In the absence of bridges the establishment of a better description of ferry than that now in use is desirable at some of these points of intersection.

Along the northern, eastern, and southern frontiers the roads connecting the Mysore province with Her Majesty's territories are sufficient to meet all ordinary requirements. The outlet to the Wynad at the south-eastern corner of the Mysore district is, however, impassable during the rains; and as the coffee plantations of the Wynad draw the whole of their labour from Mysore, as well as the grain to feed that labour, the improvement of this, the Mysore-Manantoddy road, is of importance. At the same time it must be added that the Wynad has good communication with the Gundulpett taluk by an excellent bridged road recently completed. Communication with the Canara district on the west is impeded to a serious extent during the monsoon by the imperfect condition of the Manjarabad, Bhoond, and Agumbi ghats, the first two of which are now being gradually improved. The necessity for perfecting, as far as possible, these inlets from the west and for improving the communication between the heads of the ghats was well illustrated during the July rains of 1877, when the price of grain at Suklespur and Mudgherri was greatly enhanced by the failure on the part of some traders to get their grain-carts up the ghats. The ascent of the Bhoond ghat or Munjarebad ghat is seldom or never attempted during the heavy bursts of the monsoon, but on this occasion the extraordinary high prices prevailing apparently induced a few enterprising merchants to make the attempt. At this time in South Canara rice was selling at 12* seers the rupee; at Suklespur, Wastara, Aldur, Mudgherri, it averaged 3½ seers the rupee. The mere fact of bridging and improving the road connecting Chikmaglur with the head of the Bhoond ghat has effected a very sensible reduction in the cost of conveying coffee from the Kadur plantation to the coast. To make perfect the roads over and along the ghats would sensibly affect the cost of food in the west in time of famine, and the importance of this object is materially increased by the large numbers of coolies who now gain their livelihood in the rapidly-developing coffee plantations of Koppa, Kadur, and Manjarabad.

The extensive triangular tract of country bounded by the Tarrikere-Chittledrug, Shemoga-Hiriyur, and Chittledrug-Harihar roads is badly off in the matter of roads, the line traversing it from Benikpur viâ Chennagiri, Dumi, and Holakere being very imperfect. It may, however, be remarked that this part of the country is but sparsely populated.

The ordinary means of conveyance in the country is by bullock-carts, of which there is a sufficient number for its wants. A good deal of the grain coming up

---

* I am doubtful about this, and cannot find my notes on the matter.

MYSORE.

Captain Bowen, R.E.

the western ghats and much of that passing from village to village in the Mulnaad, is carried by pack-bullocks, a small fraction by donkeys.

The ordinary cost of carriage is in the Public Works Department 1½ annas per mile per 1,000 lb.; but during the year 1877 the rate was raised to 2 annas per mile, which was about the rate then prevailing for carts employed in the grain traffic. In ordinary years, however, the cost of conveyance of grain is, I should say, not more than 1 anna per mile per 1,000 lb.

RAJPUTANA.

Capt. Barr.

Col. Benyon.

Dr. Moore.

RAJPUTANA.

Jodhpúr, Jesalmir, Captain Barr.—There is only one metalled road in the province; it is 100 miles in length, and passes through the south-eastern portion of Marwar, from the rail at Beawar, to the boundary of Marwar and Sirohi, about 40 miles from the foot of Mount Aboo. The country being generally flat and easy to traverse, roads connecting villages are plentiful and easy for carts, camels, and bullocks. In seasons of scarcity of food grains, Brinjarra bullocks carry a great deal. In ordinary years, carts are generally used in the more cultivated districts, while camels and bullocks are employed more generally in the northern and north-eastern parts, where the country is chiefly a sandy desert. The ordinary rates of carriage are: wheeled carriage 5 annas per ton per mile in dry weather, 6½ annas per ton per mile in hot weather; packed carriage, 8 annas per ton per mile.

Jaipúr, Colonel Benyon.—There are 265 miles of good metalled road in the state. One parallel to the Rajpootana State Railway (constructed previous to the railway) 127 miles long, and two good metalled roads perpendicular to the line of railway as feeders to it —one from Mandoar to the Kerrowli border, one from Jeypore to Tonk, the adjoining state to the south.

When the famine in 1868 occurred in Rajpootana, the road mentioned above as parallel to the railway was of the greatest use in facilitating the transport of grain from Agra to Ajmere.

Dr. Moore.—Means of communication are very backward. The first-made road in the province was through the Burtpore state—a work initiated when the chief was a minor, and the administration in the hands of a British officer. This was about 15 years ago. Shortly afterwards, the Jeypore Maharajah was induced to continue this road through his territory, as far as the city of Jeypore, and this road was completed, excepting one or two bridges, some eight or nine years back. Then a road was made from Ajmere to Beaur, in British territory, and more recently from Jeypore to Ajmere, partly through Jeypore and partly through British districts. As usually happens, some good results even from epidemics and famines. The famine of 1868–69 painfully showed the great necessity of better means of communication and the works instituted under the guidance of Colonel Keatinge took the form of road making. The most important road made was through the Burr pass, which, although the central road of the province and the route from Bombay and Guzerat to the north-west, was nevertheless in exactly the same condition as it probably was a thousand years previously,—scarcely passable for a wheeled vehicle. Afterwards the road was carried on through Marwar and Serohi to the foot of Aboo. The continuation of this road viâ Deesa, Sidphoor, and Mysanna to Ahmedabad is still in a most disgraceful condition, being simply a track through the sand, not drivable over. Another famine road was from Ajmere, or rather Nusseerabad, to the military station of Deoli, and some attempt at a road was also made from Deoli to Tonk, and between Jeypore and Tonk. None of these roads are, however, fully bridged. There are one or two rivers on all of them, which, for a few days every year, always stop traffic.

CENTRAL INDIA.

Lt.-Col. Bannerman.

ir Shahamat Ali.

Lt.-Col. Martin.

CENTRAL INDIA.

Lieutenant-Colonel Bannerman, Bhopal.—A metalled and bridged road to G. I. P. Station at Etarsee. Carts are used in dry season, and at other times pack-bullocks.

Baghelkhand.—A large portion of Baghelkhand is full of jungles and hills, and is very backward in the way of internal communications. The several market places are connected by common country paths almost impassable during the rains. North of the Kaimurs there is the magnificent Deccan road, from Mirzapore to Jabalpur, which for 150 miles runs through this agency, and passes through Rewah and Maihar. (2) Branching from it is a road from Rewah to Allahabad viâ Sohagee pass. (3) The Sutna Bella road, bridged and metalled throughout, which leaves the Deccan road nine miles from Rewah, and strikes the railway at Sutna. (4) The imperial road from Sutna to Nowgong, in the heart of Bundelkhand, almost completely bridged and metalled, and runs through the states of Nagode and Sohawal.

These 1, 3, 4 are open all through the year, and the only bad part of 2 is in Rewah territory.

On these lines traffic is by carts, of which there is a limited number, on all other by pack-bullocks generally.

On the pucka roads the cost per mile for conveying one ton of merchandise is 3 annas 7 pies, or say 4 annas; in the wilder parts of the country, by pack-bullocks, 4½ annas."

Rutlam, Mir Shahamat Ali.—The means of communication are the common cart tracts, and not made roads, except the Mhow and Neemuch road, which alone is metalled and bridged. All other centres of trade are connected by cart tracks, which are only open for carts in the dry weather, and closed for wheeled traffic in the rains. The ordinary means of conveyance is mostly by wheeled carriage, and also by pack-bullocks, especially in the hilly tracts. There is a sufficient number of carts in the district for all its wants. The ordinary cost per mile of conveying one ton of merchandise, either by wheeled or by pack-bullock carriage, is 7 annas.

Western Malwa, Lieutenant-Colonel Martin.—The Holkar and Neemuch State Railways, completed to Rutlam and under construction to Neemuch, traverse almost the extreme west of the district from south to north. A branch connects Oojein with this line, and they bring the furthest corner of the district within less than 100 miles. A metalled road runs from Mhow to Neemuch, and the Agra and Bombay road, also metalled, traverses the district at the eastern extremity in a N.E. direction. A metalled road is under construction from Oojein to Agra, 43 miles in length. These are all the means of communication open or under construction, and capable of use throughout the year; and, as stated before, roads are the most useful works that can be undertaken.

CHAPTER I.—QUESTION 19.

To what extent are railways developed in your province? What districts are not traversed by them, and what distances have to be gone to reach the railways from the districts furthest from them? Are any districts so much isolated as to make it desirable to extend railways to them to facilitate the introduction of food in time of famine? Has the effect of the existing railways been to equalise prices and stimulate trade to any important extent? Give any facts that support this view.

PUNJAB.

Punjab.
Major Wace.

A railway traverses the submontane districts of the province, commencing with Gurgaon at its south-east end, and ending at Jhelum near its north-west end. This will shortly be completed to Rawalpindi, and perhaps to Attock, which stations are respectively 100 and 44 miles from the frontier city of Peshâwar. Another line, branching off from the first at Lahore, runs in a south-westerly direction to Mooltan, and thence to Karráchi down the Indus valley. The first 30 miles of railway in the province, that between Lahore and Amritsar, was opened in March 1862; the line from Lahore to Mooltan was opened in April 1865; by October 1870 the Lahore and Amritsar line was extended to Gházíabad, near Delhi, thus joining the terminus of the East Indian Railway, and placing the trade of the province for the first time in direct and unbroken railway communication with Calcutta and Bombay. The extension from Lahore to Jhelum was opened in 1876. The Indus Valley line, joining Mooltan with the Kotree and Kurrachee line in Sind, has only just been opened. The total railway mileage open in the Punjab now is :—

Name of Railway.	——	Miles.
Punjab Northern State Railway.	Lahore to Jhelum - -	103
Sind, Punjab, and Delhi Railway - - -	„ to the river Jumna, en route to Delhi.*	224
	„ to Mooltan and Sher Shah.	218
Indus Valley State Railway.	Mooltan to the river Sutlej, en route to Karachee.†	57
Rájputána State Railway	Delhi to Riwári, en route to Ajmir.‡	55
	Total - - -	657

---

* The remaining line to Delhi, 124 miles, runs through the Sahâranpur, Muzaffarnaggar, and Meerut districts of the North-Western provinces.

† The remaining portion of the line is now open to Kotri, and thence by the Sind Puujab and Delhi Company's line to Karrachi.

‡ This line will, when completed, connect Delhi with Baroda and Bombay.

Lines under Construction.—The only considerable line under construction is the extension of the Punjab Northern State Railway from Jhelum viâ Rawalpindi to the Indus river at Attock. The distance is about 120 miles. The portion to Rawalpindi will be opened, perhaps, 12 months hence; the probable date of completion of the remaining 56 miles cannot yet be stated. It is also in contemplation to construct a light narrow-gauge line from Lálla Músa, near Gujrát, to Miáni, on the Jhelum, a distance of about 50 miles. Miáni is opposite the salt mines of Pind Dádan Khan; and the salt traffic on the line would of itself yield a handsome return. The country which the line would pass over is perfectly flat, and, the material lately used on the narrow-gauge line between Lahore and Jhelum being utilised for this line, the cost of construction will be very small.

Districts not traversed by Railways.—Assuming that the line of railway which already extends from Delhi to Jhelum will shortly be completed to the Indus, of which there is practically no doubt, and that a district of which the major portion lies within 50 miles of a railway is for all practical purposes served by it, the only districts to which we need direct our attention are—

(1.) Gurdáspur and Kángra, lying north of the railway system;

(2.) The Hissar division line south of it; and

(3.) The Jhang district and Deraját division, which may be roughly described as the country south of the Salt Range and west of the Chenab.

To take each of these tracts in turn—

(1.) From the Amritsar station to Pathánkot at the northern end of the Gurdáspur district is 72 miles, and the road is metalled. From Jullundur to Kángra is a distance of 88 miles; the road is not metalled, but is otherwise an excellent one. It is not unlikely that a light railroad may be constructed joining Amritsar with Pathánkot; but the matter is not urgent.

(2.) From Delhi to Hissar is 104 miles, and from Delhi to Sirsa is 157 miles. Thence viâ Fázilka to Montgomery, on the Mooltan line, is 158 miles. The road from Delhi to Sirsa is partly metalled.

(3.) This tract may be considered as having Miánwáli and Bannu (Edwardes-abad) as the points most removed from the railway system, with Jhelum and Mooltan as the nearest convenient points on the railway. These several points are connected by excellent unmetalled roads; they are not bridged, but as the entire carriage of the country is camel carriage, and the rainfall very small, bridges are little needed. The distance by road from Miánwáli to Mooltan is 194 miles, and to Jhelum 115 miles. That from Bannu down the west bank of the Indus to Mithankot is 307 miles. Mithankot is on the Indus just below its confluence with the Chenab, and is some 25 miles from the Indus Valley Railway.

No districts are so much isolated as to make it desirable to extend railways to them to facilitate the introduction of food in time of famine. The only part of the province concerning which any discussion can arise is the tract numbered 3 above, the country west of the Chenab and south of the Salt Range. The population and irrigation in this tract are :—

District.	Population, Souls.	Per cent. of Area cultivated, which is—	
		Irrigated.	Sailab, *i.e.*, protected by River Floods.
Bannu - - - - - -	287,547	15	13
Dera Ismail Khan - -	394,846	32	35
Dera Ghâzi Khan - - -	308,840	57	10
Jhang - - - - - -	348,027	69	30
Total - - - -	1,339,260	—	—

Taking into account the extent of irrigation and sailáb cultivation, the large amount of camel carriage existing in this tract (see reply to question 18), the great facilities for river carriage on the Indus and

CHAP.I. QN. 19.

PUNJAB.

Major Wace.

Jhelum, and the fact that no severe distress occurred in this tract during 1860–61 and 1868–69, there would appear to be no urgent reasons of famine protection for extending railways to it.

The opening of railways in the province has certainly both equalised prices and stimulated trade.

As instances of the stimulation of trade by the railways, we have the large exports of grain during the Bengal famine, and again during the late Madras famine, and to Bombay for the trade with Europe. During the Bengal famine, between the 15th November 1873 and 31st March 1874, there left the province eastwards by railway—

	Maunds.
Wheat	594,788
Barley	647,375
Gram	646,725
Jowár	670,959
Rice, maize, and other grains and pulses	736,936
Total	3,296,783

equal to 117,742¼ tons. Subsequently, the net exports of food-grains (exports minus imports) across the east boundary of the province have been :—

—	By native Land Carriage.	By Railway.	Total.
1874–75	876,079	2,840,548	3,716,627
1876–77	—293,611	420,021	126,410
1877–78	688,408	6,835,709	7,524,117

These are broad instances of extensive movements of grain to meet trade demands at a distance, which would certainly have been impossible, except in a much smaller degree, but for the railways. Similarly, in the reply to question 20, it will be seen that the trade which the Ravi used to carry has been transferred to the Lahore and Mooltan Railway, and that the extension of the line to Sind is likely to have a similar effect on the Sutlej trade.

It is not so easy to give facts showing how the railways have operated to equalise prices, because prices in every district depend on many influences, of which that of the railways is only one. But no one who has watched the operations of trade in the Punjab towns will have any doubt of the fact. The grain dealers receive immediate advice of the fluctuations of prices in the large marts with which they usually trade; advice conveyed as frequently by telegraph as by the post, and no chance of a successful transaction is missed by them. These are not the sort of men to be ignorant of the relative cost of road, river, and railway carriage,* nor of the fact that the railway is not only the cheapest, but also by very much the most expeditious, of the three.

The following statement, if examined, will show some of the difficulty that there is in tracing by existing prices the influence of the railways. The prices of districts off the railways follow very closely those of towns on the railway. And it is by the provincial exports and imports rather than by bare prices of adjacent districts that the influence of the railways is most easily traced.

NORTH-WESTERN PROVINCES AND OUDH.

Mr. Buck.

NORTH-WESTERN PROVINCES AND OUDH.

An ordinary railway map will show more clearly than any verbal description the extent to which railway communication has been developed in these provinces. The East India Railway traverses them from their south-east corner as far as Delhi, sending off at Allahabad a branch to Jabalpur, which, meeting there the Great Indian Peninsula line, places these provinces in direct connection with Bombay as well as Calcutta. The Oudh and Rohilkhand Railway joins the East Indian Railway at Benares on the east, and, running in a curve through Oudh and Rohilkhand, meets the other line again at Aligarth in the west. From Lucknow, near the centre of the curve, a branch line has been thrown out, meeting the East Indian Railway at Cawnpore. Opposite Delhi, the Scinde, Panjáb, and Delhi Railway forms a continuation of the East Indian Railway to the Panjáb.

These three lines (the East Indian Railway, Oudh and Rohilkhand Railway, and Scinde, Panjáb and Delhi Railway), are all broad-gauge and in direct connection with one another at all points where they meet, with the exception of the Oudh and Rohilkhand

Railway, at Benares, where its terminus is separated from the East Indian Railway by the river Ganges, as yet unbridged, though the construction of a bridge is under contemplation. The provinces are therefore traversed by two parallel broad-guage systems, the East Indian Railway, and Scinde, Panjáb, and Delhi Railway, on one side of the Ganges, and the Oudh and Rohilkhand Railway on the other. But the latter is subordinate to the former, with respect to which it performs at the same time the functions of feeder and competitor. Out of 47 districts in the North-Western provinces and Oudh, 24 are brought into contact with one or other of the railways.

The East Indian and Scinde, Panjáb, and Delhi Railways, in their course up the provinces, either pass through most of the chief trading centres of the Doab or are connected with them by short branch lines (as is the case at Benares, Agra, and Delhi). An important exception is the town of Farukhabad, which is left at a distance by the bend to the south which the East Indian Railway makes in its approach to Agra. Out of 35 districts in the North-Western provinces 15 are traversed for some portion of their length by the above railways.

The second system has placed all the chief towns in Oudh and Rohilkhand in connection with the East Indian Railway, and passes through nine out of 16 districts included in these two tracts.

In addition to these broad-guage lines there is a short narrow-guage line connecting the towns of Muttra and Háthras, which represents the first experiment made in these provinces of the construction by Government of light railways as feeders to the main lines. The profits are four per cent., and as far as regards local traffic the only trade now carried on has probably reached a maximum, but it will be seen from the map that it is proposed by Government to extend this line from Muttra to Achnera, and thus effect a junction with the light railway which runs from Agra to Rajputana, an extension which will attract to this line much of the traffic which now runs between these provinces and Rajputana viâ Agra, and may add to the receipts

It is now proposed to commence a system under which, each year, a certain sum will be laid out in light-railway construction; and those lines, the direction of which has been more or less definitely determined, are marked on the appended map. The question of the comparative cheapness of roads and railways has formed the subject of much discussion. Sir J. Strachey, when Lieutenant-Governor, was much in favour of the construction of a network of light railways throughout the provinces, which, while adding to the receipts of the main lines by feeding them with traffic, would develop the resources of the tracts through which they passed, and would gradually relieve Government of the expense of maintaining a great number of metalled roads. The advantages of a railway over a road, apart from military or political considerations, may be considered proved if only sufficient traffic will take the railway to make it pay the bare interest on the money expended in its construction. In order to secure this object as far as possible, these light-railways should follow the present lines in which the trade of the country runs, and should be thus provided with the minimum amount of traffic which will make them pecuniarily successful. It is in determining the direction and extent of traffic streams that the collection of trade statistics are most useful.

Speaking generally, the trade of these provinces may be said to run in two streams lengthways and four streams crossways.

The two former are—

(I.) Along the Ganges-Jumna Doab belt through Benares and Lower Bengal and Calcutta.

(II.) Along the penultimate belt to Patna and Calcutta.

These two lines meet at Patna, below which they form one stream connecting these provinces with the port of Calcutta.

CHAP. I. QN. 2

NORTH-WESTERN PROVINCES AND OUDH.

Mr. Buck.

The four streams which run across or into these two main streams, are—

(I.) From Rohilkhand and West Oudh to the Doab. This stream may be subdivided according as it merely acts as a feeder to the main trunk line of the Doab, or as it actually crosses it on its way to the Panjab or Rajputana. So much as is a feeding stream divides, one portion passing up into the Upper Panjáb by the Sindh, Panjáb, and Delhi Railway, the other passing down towards Bengal by the East Indian Railway. The cross streams converge at Delhi for the Panjáb, and at Agra for Rajputana.

(II.) From Bundelkhand to the Doab. This stream may be considered merely a feeder to the East Indian Railway, which it meets at Cawnpore.

(III.) From the easterly districts of Oudh and the Benares division districts, which are south of the Gogra, to the East Indian Railway, which it meets at Allahabad, Gházipur, &c., and other places. This stream is merely a feeder to the East Indian Railway.

(IV.) From the districts of Oudh and the Benares divisions, which are north of the Gogra, towards the Gogra.

In great part this stream merely feeds the Gogra, but a portion comes over to the East Indian Railway, which it meets with at Benares or Ghézipur.

To apply these remarks to the railway communication which at present exists, Trunk line No. 1 is almost entirely provided for by the Sindh, Panjáb, and Delhi and East Indian Railways, and will be entirely provided for when the proposed line from Cawnpore to Farukhabad and Kásganj is completed.

Trunk line No. II. is partly served by the Oudh and Rohilkhand Railway, which has diverted a large portion of it viâ Benares. There is still, however, an enormous trade down the Gogra, amounting in 1877–78 to some 43½ lakhs of maunds (about 155,360 tons). What trade now follows this line is carried entirely by the Gogra, there being no good road or railway to compete with it. It has been to a great extent proved that in North India a railway can compete successfully with a river, and a line connecting Upper Oudh with Chapra running down the Gogra-Gandak Doab is likely to prove a financial success if the expense of bridge-making is not too great an obstacle.

Side stream (I.), so far as it is a feeder to the upper Panjáb, is carried by the Oudh and Rohilkhand Railway line to Aligarh for the eastern districts of Rohilkhand and the western districts of Oudh; for the eastern districts of Rohilkhand it travels by road. The proposed line from Bijnor to Sahâranpur is to carry this latter.

So far as it is a feeder to trade going down country, it is efficiently carried by the Oudh and Rohilkhand Railway line from Moradabad to Aligarh, and from Lucknow to Cawnpore.

The cross streams to Delhi and Agra, which also are a portion of side stream (I.), are carried more or less completely by the Aligarh and Cawnpore lines of the Oudh and Rohilkhand Railway. The portion which runs to Delhi from the Bijnor district and the westerly portion of the Moradabad district, at present travels by road, and a line from Bijnor to Muzaffarnagar would be of great use in carrying it. The stream is an important one.

Side stream No. II. will be carried by the proposed line from Cawnpore to Mau Ránipur. At present it travels by road. There is a great doubt whether it would not be better to connect Bundelkhand with East Indian Railway line south of Allahabad, and divert the course of the trade from its present line to one more convenient for it.

Side stream No. III. will be carried by two lines, one through the Partabgarh district, the other through Gházipur and Azamgarh; both will meet the East Indian Railway, with which Ghâzipur is to be connected by a short line now almost completed.

Side stream No. IV. will be carried by the line from Bahraich to Gonda and Nawábganj, on the Gogra.

AP.I. QN. 19.

NORTH-WESTERN ROVINCES ND OUDH.

Mr. Buck.

The map shows more clearly than any description what portions of these provinces are at present isolated from railway communication. It will be seen that, as soon as the proposed light-railway system is completed, the portions of the provinces which will be at any great distance will only be the northern portions of Kumaun and Gharwál, the southern portion of Mirzapur, and the Lalitpur districts.

At present the tracts furthest removed from a railway station are the four above named, together with the districts of Gorakhpur and Kheri.

The distances of these places from the nearest accessible railway station are approximately noted below: the distance is taken from the district head-quarters, unless the contrary is stated:—

Kumaun (Almora) - -	105 from Barielly.
Garhwál (Paori) - -	106 ditto.
Lalitpur - - -	139 from Karauli. 197 from Cawnpore.
Mirzapur, southern parts of district are about 100 miles from Chunar.	
Gorakhpur - -	76 from Zamániah, but the north of the district is some 60 miles still farther.
Kheri - - -	90 from Lucknow, but the north of the district is some 45 miles still farther.

The extent to which railways have stimulated trade may be gathered from facts noted in the reply to question 17, and it follows of course that by doing so they have greatly tended to equalise prices. In November, 1878, for instance, the price of bájra in Cawnpore was Rs. 2 per maund; export commenced to Bombay, where prices were high (about Rs. 3-5-0 per maund), and in three days the price of bájra in the Cawnpore market rose to Rs. 2-3-0.

In connection with this subject, the following remarks may be quoted from the famine replies of Lucknow and Fyzabad:—

Lucknow.—"The railway has stimulated trade to a certain extent. The railway, river, good bridged roads, and the fall of the value of silver as regards its value to gold, all taken together, have had the effect of equalising prices and stimulating trade to an important extent. As regards this I give the following facts:—

"At one small station alone, Malihabad, the export traffic of grains increased from—

564 tons in 1875
to 7,050 tons in 1876, and
to 70,855 tons in 1877

"*Fyzabad.*—Of the effect of the railway in equalising prices there can be no donbt. It is sufficiently illustrated by the table I subjoin of the exports and imports at the Fyzabad Railway station in the first fortnights of each month since the beginning of the year:—

Fortnight ending	Imports.	Exports
	Maunds.	Maunds.
15th January - - - -	2,243	7,990
15th February - - -	7,499	6,667
15th March - - - -	2,896	8,577
15th April - - - -	4,871	4,095
15th May - - -	2,652	12,310
15th June - - - -	30,000	4,258
15th July - - -	23,508	3,361
15th August - - -	35,852	4,668
15th September - - -	5,883	1,497

"These fluctuations show that trade is very sensitive to changes in price along the line of railway."

A more striking instance of the movements of grain within the province by rail, and on a larger scale, is afforded by the table on pages 19 and 20 of reply to Question 17, which shows the wave which set in from October, 1877, to March, 1878, to have been completely reversed in the succeeding two months, a fortunate harvest having changed Agra and Rohilkhand from the head of the importing to the head of the exporting blocks.

BENGAL.

BENGAL.

r. Toynbee.

Railways.—The Provincial Railway map shows the railways completed, in progress, and proposed for early construction, and will serve to indicate that, although a good deal has been done, far more remains to do before the communications of the province can be considered as in any way adequately provided for. It shows, indeed, that Bengal is at present, in the matter of railway communication, behind the other provinces of India, and it will be remembered that the want of railway communication was most seriously felt during the Orissa and Behar famines.

The Tirhoot Railway, constructed temporarily during the Behar famine of 1874, and now completed as a permanent railway to Durbhunga and Mozufferpore, facilitates communication with some of the districts which then suffered severely, but it must be extended both east and west to secure the districts against any recurrence of such severe scarcity, but nothing has yet been done towards railway communication with Orissa.

The total length of completed railway, both guaranteed and State, in the province is 1,235 miles; the districts through which each railway passes are noted below:—

East Indian Railway.—Including both loop and chord lines and short branches, 711 miles of this line are in Bengal, passing through the districts of Hooghly, Burdwan, Beerbhoom, Moorshedabad, Bhagulpore, Monghyr, Patna, and Shahabad, and skirting the Sonthal pergunnahs on both east and west.

Eastern Bengal Railway.—This line, 170 miles in length, including the Dammookdea branch, skirts the northern part of the 24-Pergunnahs district, and passes through the Nuddea district and the northern portion of the Furreedpore district.

The lines of State railway completed are:—

1st.—The Calcutta and South-Eastern, 28 miles, which is in the 24-Pergunnahs district, and connects the Mutlah river with Calcutta and the Eastern Bengal Railway.

2nd.—The Nulhatee line, 27½ miles, in the Moorshedabad district, which connects the East Indian Railway with Azimgunge, on the Bhagirutty.

3rd.—The Northern Bengal Railway, 219 miles, which is a northerly extension of the Eastern Bengal Railway, and passes through the districts of Rampore Beauleah, Bogra, Dinagepore, Rungpore, and Julpigoree.

4th.—The Tirhoot Railway, 79 miles, which connects Mozufferpore and Durbhunga with the East Indian Railway at Barh.

The only new railways under construction in the province are the Patna and Gya line, 58 miles in length, serving a portion of the Behar district, and a short extension of the Rungpore branch of the Northern Bengal Railway to the River Teesta, so that at present the eastern districts of Dacca, Mymensingh, Tipperah, Jessore, Backergunge, Noakholly, and Chittagong, the northern districts of Purneah, Maldah, Sarun, and Chumparun, and in

CHAP. I. QN.

BENGAL.

Mr. Toynb

the south and west the district of Midnapore, and the whole of Orissa and Chota Nagpore, are without railway communications.

Surveys have been made—

(1.) For extending the Tirhoot Railway from Mozufferpore into the Chumparun district to the west, and from Durbhunga into North-East Tirhoot;

(2.) For a railway in continuation of the Eastern Bengal Railway to serve Dacca and Mymensingh;

(3.) For extending the Calcutta and South-Eastern Railway into the heart of the 24-Pergunnahs district;

(4.) For a line from Rungpore to Dhubri, on the Brahmaputra;

and, if money can be provided, these lines will be put in hand at once, and will, when completed, be a very important addition to the communications of the province.

A survey has also been made for a line to connect the Tirhoot and Northern Bengal Railway systems, passing through North Bhagulpore, Purneah, and Dinagepore districts; but this line cannot at present be carried out, as there is little chance of its fulfilling the primary conditions now attached to all railway projects, that they shall be commercially remunerative.

Further lines are projected, but it will necessarily take a long time before the railway communication of the province will be developed to the full extent desirable.

Many parts of Chota Nagpore and of Orissa would contribute largely to the food supply of the country if it were not for the present difficulty of carriage. A railway has been talked of for many years to connect Calcutta with Midnapore and Sambalpore, but it is scarcely probable that this can be undertaken for many years, although it is certainly most desirable to extend the benefits of railway communication to these isolated districts, in order to facilitate the introduction of food in time of scarcity or famine.

A railway is also much wanted to open up the north-west portion of Chota Nagpore; another is wanted to connect Chittagong and Commilla with the Dacca Railway system; and one of the most important of all the railway requirements of the province is a line to connect the Sunderbuns through Jessore with Calcutta, connected with a line serving directly Kishnaghur and Moorshedabad.

The effect of the existing railways has certainly had the effect of stimulating trade to a remarkable degree. It is only necessary to show this to refer to the traffic returns of the East Indian Railway and Eastern Bengal Railway for a few years back to see how great has been the increase in trade by rail. A corresponding increase has doubtless obtained in the water-traffic, with which the railways compete,—year by year with more success. The following figures will illustrate the effect of improved communications on prices, and show how they tend generally to raise them:—

1.	2.	3.	4.	5.	6.
Period.	Average Price of Common Rice—Seers per Rupee—in Districts provided with Communications.				Remarks.
	By Rail, Road, and River. (11 Districts.)	Rail and Road only. (3 Districts.)	River and Road only. (12 Districts.)	Road only. (16 Districts.)	
1862–1873 - -	19·6	22·0	21·7	23·3	Average price.
1874–1878 - -	16·7	18·6	18·9	21·8	
1862–1873 - -	17·6 to 23·2	18·1 to 24·3	17·3 to 26·3	11·7 to 34·7	Range of price.
1874–1878 - -	14·6 to 18·4.	17·8 to 19·2	16·2 to 20·8	11·4 to 29·0	
1862–1873 - -	5·6	6·2	9·0	23·0	Difference between highest and lowest price.
1874–1878 - -	3·8	1·4	4·6	17·6	

The 11 districts in column 2 are Burdwan, Hooghly, and Howrah, 24-Pergunnahs, Nuddea, Moorshedabad, Furreedpore, Patna, Arrah, Monghyr, and Bhagulpore. Those in column 3 are Bankoora, Sonthal pergunnahs, and Hazareebagh.

The 12 districts in column 4 are Midnapore, Maldah, Rajshahye, Rungpore, Pubna, Dacca, Backergunge, Mymensingh, Noakholly, Tipperah, Tirhoot, and Sarun. Sixteen other districts are in column 5. It is not claimed in grouping these districts that the classification is absolutely correct; it is based on the principally used and most important communications of each district. Only the East Indian and Eastern Bengal Railways are taken into account, the State railways not having been in full working order during the period embraced. If we leave out the figures in column 3 as averages obtained from too small a number of districts, the result is very striking, and shows not only that good communications have a tendency to equalise prices, but have also a tendency to raise them permanently. The period 1874 to 1878 may be taken to represent a period of unusual commercial activity as regards food-grains, owing to the famines in Bengal, Bombay, and Madras, and scarcity in the North-Western provinces.

CENTRAL PROVINCES.

CENTRA PROVINC

Mr. Nich

The East Indian Railway from Allahabad to Jubbulpore runs for 68 miles from Jokai into the Jubbulpore district. This line is continued through the centre of the Nerbudda valley, traversing the Jubbulpore, Narsinghpur, Hoshangabad, and Nimar districts, and passes on to Bombay.

From Gadarwara, a great mart in the Narsinghpur district, a branch, about 15 miles in length, connects the Mohpani coal-mines with the main line of the Great Indian Peninsula Railway.

From Khandwa, the Holkar State Railway runs (through the Nimar district for 36 miles) north-west

P.I. QN. 19.

ENTRAL ROVINCES.

r. Nicholls.

to Mhow, Indore, and Rutlam, to be continued to Neemuch.

From Bhosawal in Khandesh, near the borders of the Bombay presidency, a branch of the Great Indian Peninsula Railway, 243 miles in length, running through Berar, traverses the Wardha district in its greatest breadth, and terminates at Nagpur. Within these provinces its length is 67 miles.

From Wardha, a State railway, 45 miles in length, branches off, and, running through the celebrated cotton mart of Hinganghat, connects the coal-fields of Warora in the north-west of Chanda with the Great Indian Peninsula system of railways. The great iron and limestone field of Lohara is about 60 miles east of Warora. Chanda is distant 28 miles, below which navigable stretches of rivers commence. Lohara is in the North-eastern Chanda rice-field.

From Nagpur a State railway has been very recently commenced, and will run through the military station of Kamptee eastward through the Bhandara rice field to Kullianpur, the western portal of Chhattisgarh, distant 125 miles. In the province there are 550 miles of railway open and 59 stations.

The existing railways do not traverse the Saugor, Damoh, Mandla, Balaghat, Bhandara, Raipur, Bilaspur, Sambalpur, Seoni, Chhindwara, and Betul districts. The distances to be gone are shown in table overleaf.

Sambalpur is so isolated that, if expense be no object, if the chance of its being of use to prevent starvation, say three times in a century, be a sufficient ground for recommending a railway to Sambalpur, then I should point to this district.

The case of Chhattisgarh is different. Even in times when there has been an abundance of food, sufficient to allow of large exports, when grain has been procured for money at rates which some 170 miles westward would be considered high, but not very high, untold deaths from starvation have occurred; plenty lulled the people into fancied security, cheapness was the "lotus" which they eat; that cheapness has been their curse. I can remember the time when the sentiment of Sir Richard Temple, that he hoped to see cheapness driven from her last stronghold in Chhattisgarh, was ridiculed. Time has proved him right. So long as there was this land-locked home of cheapness, thrift, industry, enterprise, were works or virtues of supererogation. All but a few were miserably poor amid the plenty, dependent on the few exceptions for life itself, without resources or credit in a time of distress. The opening up of the country, however imperfectly, by the Great Eastern road, has permanently raised prices and called forth the latent energy of the people. The opening of the railway will give a stimulus, an impetus, of almost immeasurable force. When the railway was opened in the Nerbudda valley, the sudden rise of prices, till a general rise of wages followed, was felt by the people with no little severity; but it was just the sting of the mustard plaster, afterwards promoting the more healthy circulation of the sluggish stream of life.

The Chhattisgarh, "land of threshing floors," will, by means of this new railway, become connected with Nagpur. The question arises whether Jubbulpore and the countries in railway communication with Jubbulpore might not, with advantage, as a mutual protection against famine, be connected with the Chhattisgarh country. The lead viâ Nagpur and Bhosawal to Jubbulpore or to the portal of Chhattisgarh, as the case might be, would be very long. The nearest point of this new railway to Jubbulpore would be at or near Tirrora, in Bhandara. North of this is the rich valley of the Upper Weinganga. A railway in this direction would have to cross the drainage of parts of Seoni or of Balaghat, but it would protect the Balaghat lowlands and tend to bring under cultivation large tracts in the highlands of Balaghat and Mandla. The distance by rail from Kallianpur to Jubbulpore would be reduced to something over 215 miles, of which 175 probably would be the length of this connecting line. Without this connecting line the distance from Kallianpur to Jubbulpore by railway would be 748 miles. The distance from Raipur to Jubbulpore over the Bajadhar ghat and through Mandla is 203 miles. This connecting line would also shorten the railway-traffic distance of Jubbulpore from Nagpur by some 353 miles. But as to the cost and engineering difficulties of such a line I know nothing.

The district of Damoh is somewhat isolated, not by reason of great distance, but by physical causes; scarped hills with very few practical passes shut off its southern portion (which, however, is but very thinly inhabited) from Jubbulpore and Narsinghpur. One brinjara track leads to the railway at Chhindwara, a busy town and station in the Narsinghpur district, another to the Shahpura station, in Jubbulpore. The military road from Saugor to Jubbulpore, passing through the head-quarters of the district, traverses the Singrampur Kattanghi pass. Eastward from Damoh an indifferent road, saddled with transit duty in the independent state of Panna, meets the East India Railway at Murwara and Jokai. To the north it is shut in by the Vindachal hills, with but few brinjara tracts through Bundelkand. On the west it has access by one road to Saugor, by another viâ Garhakotah and Rehli to Bhopal and Malwa, and, more important still, to the railway in Narsinghpur. Otherwise it may be said to be land-locked. But its highest capabilities would probably not support a railway, or even a section of a railway; and its existing means of access to grain stores, if it could pay for its requirements, are probably sufficient.

The sub-division of Sironcha, lately the Upper Godavari district, is very isolated. It is small and self-reliant.

Question.—Has the effect of the existing railways been to equalise prices and stimulate trade to any important extent?

Certainly, the railways have in a marked manner tended to equalise prices, not only in the districts to which they have been extended, but to great distances around. Karbi, the dry fodder stalks of the jowari plant, have been sent from Nagpur so far as Akola, 158 miles distant, till it could only be sold in Akola at a loss. The dry mhowa flower, ordered for Bombay, has been collected from the jungles and accumulated at Nagpur, having been countermanded, owing to the levelling of the rates at Bombay and at Nagpur.

In support, I quote from a memorandum of the chief engineer, Central Provinces, on the Chhattisgarh Railway:—

"Perhaps some idea of the cost, wear and tear, and difficulty attendant on the transport of grain from Raipur to Nagpur may be formed from a perusal of the subjoined figures, taken from the price current of the last few years. I compare in each case the price at Raipur* with the prices one month later in the districts which draw their food supplies from Chattisgarh.

"Table showing the number of seers of food grains sold for one rupee at—

	Raipur.	Nagpur.	Warha.
Rice in January and February 1865	12	7	5
Wheat in March and April 1866	13	9½	8⅝
Rice in January and February 1867	12	9	7
Wheat in March and April 1868	52	18	17
Rice in January and February 1869	9½	6	5
Wheat in March and April 1870	19	12½	13

"From these figures it may be deduced that food selling at 19 seers per rupee cannot be put down at Nagpur under nine seers a rupee. It is very different when food comes by railway. Last year, in the months of scarcity, a good deal of jowari (millet) was imported in Nagpur from Akola, a place on the Great Indian Peninsula Railway, 158 miles west of Nagpur. Consignments of grain were only two days

---

* From Raipur to Nagpur, 180 miles.

Chap.I. Qn.19.

Central Provinces.

Mr. Nicholls.

on the road; 360,000 maunds came into Nagpur by railway during the year. Yet the difference between Akola and Nagpur prices was only two seers a rupee; thus the number of seers of millet sold for one rupee as per published price current at—

	Nagpur.	Akola.
In March 1869 - - -	14	17¾
In April 1869 - - -	15	17
In May 1869 - -	15	16½."

I think this one example is quite conclusive as regards the equalisation of prices rendered possible only by the opening of the railway to Nagpur.

I give the following extracts from our Government records to prove how vastly the existing railways have stimulated our trade:

Increase of traffic for the whole province:—

	Tons.	Mds.
1863–64 - -	102,341	3,909,008
1864–65 - -	134,719	4,386,251
1865–66 - -	136,265	5,519,766
1866–67 - -	175,561	6,517,864
1867–68 - -	196,432	6,110,897
1868–69 - -	209,089	6,795,263
1869–70 - -	237,044	7,144,465
1870–71 - -	235,189	6,965,244
1871–72 - -	350,138	8,091,546
1872–73 - -	244,569	6,935,492
1873–74 - -	326,918	7,747,732
1874–75 - -	310,923	7,737,823
1875–76 - -	353,620	8,113,619
1876–77 - -	390,106	6,990,631

No doubt some part of the increase in trade is due to our increased population, our moderate settlement, and influences beyond our borders; but much of the increase is the direct result of the opening up of the country by the railway, and became only possible through this means of cheap and rapid communication.

Next, I will show, in a table, some of our newly created export trades, due almost, if not entirely, to the railways:—

EXPORTS.

—	1874–75.		1875–76.		1876–77.	
	Quantity in Maunds.	Value, Rs.	Quantity in Maunds.	Value, Rs.	Quantity in Maunds.	Value, Rs.
Linseed and other oil seeds -	808,806	25,88,685	1,718,917	48,43,908	1,435,520	46,94,567
Wheat, rice, and other crops	2,756,928	49,53,060	3,412,534	53,77,861	5,311,416	99,42,201
Ghee and edible oils - -	40,820	5,61,953	46,227	8,10,887	52,310	11,14,173

Our older established trades are thus shown—

—	1863–64.		1868–69.		1876–77.	
	Quantity in Maunds.	Value, Rs.	Quantity in Maunds.	Value, Rs.	Quantity in Maunds.	Value, Rs.
Cotton exported -	372,521	1,21,93,334	299,099	65,35,173	221,048	39,13,926

Of course, in judging of these figures we must look to the quantities more than to the value, for the rates during the American war were extravagantly high.

IMPORTS.

—	1863–64.		1868–69.		1876–77.	
	Quantity in Maunds.	Value, Rs.	Quantity in Maunds.	Value, Rs.	Quantity in Maunds.	Value, Rs.
Cotton piece goods - -	27,545	46,15,337	102,531	1,01,19,260	104,512	87,23,494
Hardware - - -	32,824	11,44,319	*206,178	72,81,609	*185,191	22,18,313
Salt - - - - -	600,899	26,73,170	856,470	51,55,589	987,323	39,96,410
Saccharine produce - -	200,528	23,30,614	190,651	16,53,729	274,160	23,34,620
Cocoa and other nuts -	33,294	5,03,689	107,961	10,33,376	114,944	11,82,467

* Includes railway paint cotton presses machinery.

BERAR.

Berar.

Mr. Dunlop.

The effect of the existing railways has undoubtedly been to equalise prices, and to stimulate the trade of the province to a very great and important extent.

Before railway extension the outlet for our produce was a long and tedious road route. Now, with telegraph and railways, we are in direct communication, not only with other parts of India, but with other parts of the world.

Prices of cotton in Berar are ruled by the changes in the Liverpool market, and the effect of a frost on the cotton crop of America at once affects the rates in the Khamgaon market.

In support of the above view I cannot do better than give the following extract from a report by the Cotton Commissioner in 1869:—

"By the introduction, too, of an improved class of full-press, which, even in the dry atmosphere of the Berars, turns out a bale containing 3½ cwt. of cotton net, and by the liberal terms accorded by the Great Indian Peninsula Railway Company to the well-packed cotton, and by the regularity with which the consignments are delivered in Bombay, the cost of the carriage of our produce from the market to the seaboard has been greatly reduced; and the delay and

Chap. 1. Qn. 19.

Berar.

Mr. Dunlop.

loss, and expense and trouble, attending the transport of our cotton from the interior to Bombay are now legends of the past.

"Few can be more sensible than I am of how much this great gain is due to the arrangements of the Great Indian Peninsula Railway Company; and at the end of this, another season, I would desire to bear testimony to the benefit that has resulted to the cotton trade of our provinces by the excellent arrangements of the traffic department,—a view in which your chamber will, I doubt not, heartily join."

Since I commenced this letter I have quite by chance come upon an extract from a report which was quoted some years ago by the late Governor of Bombay, Sir Bartle Frere, the Member of the Supreme Council in Calcutta, in a letter addressed to an officer in Central India, in which he urged the improvement of the means of communication between the cotton markets and the sea-ports. This extract (from the report of General Balfour, C. B.) so correctly describes the condition of the trade at a comparatively recent date, that I cannot resist the temptation of inserting it here. It will show those whose introduction to the cotton trade in the interior has been subsequent to the completion of the railway the very great change that has taken place during the last few years, and will help to remind us of the importance of perfecting the communications in the cotton districts, if we desire to ensure the stability of the trade.

General Balfour wrote:—

"Formerly the greater part of the cotton was taken 500 miles on bullocks to Mirzapur on the Ganges, and thence conveyed on boats, 450 miles, to Calcutta. Now, the greater part goes to Bombay,* still wholly on pack-oxen, the distance varying from 126 to 450 miles, according as the cotton is purchased at one mart or another. The hire of a bullock for the journey ranges from about Rs. 5 to 16, the chief cause of variation being the time of year: a load is about 250 lbs. But this is not by any means the whole cost of conveyance; the indirect expenses are much greater,—the cotton is eaten by the bullocks, stolen by the drivers, torn off by the jungles through which the road passes, and damaged by the dust and the weather, as well as by having to be loaded and unloaded every day, often in wet and mud.

"The Bombay Cotton Committee† of 1847 state their opinion, after careful calculation, that the whole charges of conveyance to Bombay from the mart of Khamgaum, only 216 miles distant, being the nearest of all, do not fall short of Rs. 33 a candy (784 lbs.), the original cost of which at the latter place is not more than Rs. 50: thus the cost of carriage to the port of shipment is 66 per cent. on the price of the commodity. The usual selling price in Berar is under one anna ($1\frac{1}{2}d.$) a lb., as we learn from Royle, as well as from the paper just quoted and other authorities: the absolute cost of the conveyance from the producing country to Bombay is, therefore, fully 1*d.* a pound. And this, though it seems small, is in fact enormous on so low-priced an article; so that in the report of the Cotton Committee above referred to, the rise of even one half-penny a pound at Liverpool is spoken of as operating most beneficially on the Bombay market.

"And we cannot regard the formation of good roads as less important or less essential to the prosperity and advancement of the country than the extension of irrigation. The two species of improvement are intimately connected, and should go hand in hand. Without the means of transport and of interchange the most valuable products become a drug, and production is arrested; thus roads give value to produce, and large production gives a use and value to roads. No advantages can make up for the want of the means of transport; at the present time good wheat is selling in the Berar valley at Rs. $5\frac{1}{2}$ (11*s.*) the quarter, and the whole cost of freight and charges from the coast to London do not exceed 15*s.* a quarter; yet in the absence of good roads, and of all attempt to improve the noble Godavery for navigation, the cost of carriage from the place of production to the coast effectually keeps it out of the market. For at present the only means of exit for the produce of Berar is by carriage on pack-oxen, either to Bombay, a journey of 60 days, 400 miles to Mirzapur on the Ganges, and then 500 miles down that river to Calcutta; whereas if the Godavery river, the natural outlet of that country, were opened to navigation, the cotton and other valuable produce it yields would reach the sea-port of Coringa at its mouth in 70 hours. On the other hand, a ton of salt, which is sold at the Government stores on the coast for Rs. 27, costs Rs. 112 at Nagpur. We have already adverted (para. 433) to the enormous yearly loss in the carriage of the cotton of the same country to the sea-coast by land instead of by the river, and have noticed what large supplies of that article of the best quality for the English market would immediately flow out if the navigation were opened."

In comparison with the above, produce is now forwarded from Khamgaon to Bombay at the following rates, viz.:—

	Rs.	a.	p.	
Cotton - -	36	6	8	per ton;
Grain - -	14	9	0	do. ;

and it is freely despatched to wherever there is a demand for it.

Another fact that supports the above view is the extension that has taken place in cultivation. In 1869–70 the cultivated area was 5,361,375 acres, and in 1876–77 it was 6,413,561, showing an increase in seven years of 1,052,186 acres.

---

* Present cost of the conveyance of the Berar cotton to the port of shipment.

† I was a member of the Committee, and all our calculations were under the mark.

(Signed) H. E. B. Frere.

Bombay.

Mr. Peile.

BOMBAY.

The railways in the Bombay presidency are—

1. The Baroda line, which runs north along the coast, traversing the collectorates of Thana, Surat, Broach, and Ahmedabad successively. The continuation towards Ajmere will traverse the northern part of Ahmedabad, and the continuation to Patri and Wadhwan traverses the western part and gives access to Kattywar. A branch to Pali runs for 32 miles through the eastern part of Kaira. Few villages in Gujerat are 30 miles from the railway. The effect of the railway has been to stimulate trade. The weight of goods carried from the stations in Kaira in 1868 was 31,138 tons. Since the Pali branch was opened this has increased to 107,914 tons in 1877.
2. The Great Indian Peninsula, which runs eastward from Bombay and traverses the Thana district, Nassick, and Kandesh by its north-east branch, and Thana, Poona, and Sholapur by its south-east. The chord line from Munmar to Dhond, joining these branches above the ghats, runs through part of Nissick, Ahmednagar, and Poona. Parts of Nassick are 90 miles from the line. It runs through the eastern talukas of Kandesh, and the western are from 84 to 108 miles from the line. A State railway to join Kandesh with Gujerat has been discussed, and will facilitate the transport of grain. The most remote part of Poona is 60 miles from the line, of Sholapur about 50. So far, the railway facilities in Bombay are fair, and no new line is urgent. But in the southern districts the case is different.

Major-General Wilkins.—There are no railways in the southern division. As far south as Belgaum the

CHAP. I. QN. 19.

BOMBAY.

nearest railway station is at Poona, 212 miles distant from Belgaum, 140 miles distant from Kolapur, 70 miles distant from Sattara.

The Dharwar district is nearer to Bellary than Poona; but the railway at Bellary does not serve Dharwar and Hubli, as more speedy communication between those towns and Bombay is to be obtained by sea, or by Poona.

Considering the importance in military, political, and commercial points of view of the head-quarter stations of Sattara, Kolhapur, Belgaum, and Dharwar, which are all garrisoned by troops, their communications, though good of the kind, by sea and by road, are far behind the spirit of the age. Here is the frontier district of Dharwar, a district having a large trade in cotton and seeds, no less than 272 miles from its central mart at Hupli to a railway. Bellary is 130 miles distant only, it is true; but the railway there goes in the wrong direction to serve the people and the trade.

Three railways are needed in the southern division—

1. A line to serve the Kaladgi collectorate from the G. I. P. Railway. This line up to the Krishna river would be sufficient at present.
2. A line from Karwar to Bellary.
3. A prolongation of the Dhond and Munmar line to serve Sattara, Kolhapur, Belgaum, and Dharwar.

Of the second and third lines, the third is the most important in a political and military point of view The second may be considered to have a priority of importance in a commercial and famine aspect, as opening up railway communication with a new port.

Mr. Robertson.—The district of Sattara has no line of railway, but it has excellent roads in connection both with the railway at Poona and with the coast of Chiplun.

My experience during the late famine was, that in order to supply the districts of the southern divisions, especially Kaladgi, and to secure an ample supply of food in case of famine, a line of rail was absolutely required, extending from the G. I. P. Railway from some points in Sholapur on to Bijapur in Kaladgi, and thence on to Dharwar. Large supplies of grain were in the monsoon sent with great difficulty in carts, by bullock loads, and even by head loads from Sholapur in this division to the Kaladgi district. Had there been a line of rail, much of the distress in that district could have been averted.

There is no doubt that the existing railways have tended to equalise prices, but till the late famine fell upon us this had not been the case.

Till then traders drew their supplies from the local markets, and import by rail was hardly dreamt of. When the famine caused traders to seek distant markets, they were amazed at the result. Since then traders have commenced to seek distant and cheaper markets. The result of the famine has been to teach the people the value of the railway, and thus the railways have now the effect of equalising prices and of stimulating trade in grain to a most important extent.

Mr. Dharwar.—Railways are much wanted in the district. The high price of cart hire raised the price of grain for some time during the famine to 7 lbs. per rupee. The hire of one cart from the coast, 100 miles, was Rs. 50 for some time (the ordinary hire in usual years being Rs. 10 to 20), and the carts never contained more than 10 bags of 168 lbs. each, and generally only eight. The railway fare of a bag would have been merely nominal compared with this cost of Rs. 5 or more per bag. Another effect would have been that, as the railway would have run daily, there would have been no time (as during last rains for a month or six weeks) while the import of grain was stopped, and so prices could never have risen as they did.

But it is clear that the first need is a line in the famine districts of 1876–77 to supply them with grain.

The following lines are among the works projected by the Government of Bombay as safeguards against famine—

1. From Carwar by Hubli and Gadag to the frontier (163 miles).
2. From Gadag by Bijapur to the Barsi Road station on the G. I. P. Railway (220 miles).
3. From Dhond on the G. I. P. Railway by Satara, Kolhapur, and Belgaum, to Dharwar (255 miles).*

---

* See Correspondence of 1878; Copy provided.

SIND.

SIND.

Colonel Haig.

The following is the mileage of railway constructed in Sind:—

	Miles.
Sind, Punjab, and Delhi Railway, Sind section, Kurrachee to Kotri - - - -	106
Indus Valley State Railway, Sind section, Kotri to Sukkur, Rohri, and border of Bahawalpur territory - - - - -	310
Total mileage -	416

The above lines traverse a large portion of the Kurrachee collectorate and the entire Shikarpur collectorate. The Hyderabad collectorate, and the large but sparsely populated district of the Thar and Parkar, are not touched by the railway system. Leaving out of question the extreme easterly portion of the Thar and Parkar, where the country is more or less a desert and the inhabitants very few, it may be said that 80 to 100 miles is the greatest distance that separates any Sindhis from the line of railway. An extension of the railway system is not necessary in view to provide against future famine.

32. The Indus Valley line is not yet open for traffic. The Sind section of the Sind, Punjab, and Delhi Railway has been open for 17 years, and, in combination with the flotilla of steamers on the Indus, has undoubtedly greatly stimulated trade, the total value of the import and export trade being now, even during great commercial depression, fully 70 per cent. in excess of what it was previous to the opening of the line.

MADRAS.

MADRAS.

Board of Revenue.

These questions have been fully gone into by the consulting engineer for railways, in the note sent by him to the Famine Commission, and the Board consider it unnecessary to go over the same ground. It will be sufficient to mention here that this presidency is well provided with railways, lines passing through 13 out of the 21 districts. Of the remaining eight, six have the advantage of a long seaboard, and of the two non-maritime and non-railway districts, Kurnool and the Nilgiris, Kurnool has a railway on its borders, and the Nilgiris is a small and mountainous tract of country with a railway station within a few miles of the foot of the hills.

Though perhaps no district in this presidency, with its long seaboard, its tolerably good system of roads, railways, and canals, can be considered so isolated as to render extension of railways an absolute necessity, there are doubtless tracts where such extension would tend greatly to facilitate the import of food-grains in times of scarcity when the draught power of the country, which generally consists of bullocks, becomes weakened and inadequate to meet the requirements of

CHAP. I. QN. 19.

MADRAS.

Board of Revenue.

exceptional traffic through long-continued drought. The consulting engineer has mentioned in his note most of the places to which railway extension would be feasible and of great service. The following opinions of collectors as to the requirements of their districts, as practically shown by the late famine, are here inserted, as they indicate the directions in which inquiries should be made in the event of a large system of railway extension being resolved upon. Without detailed inquiries, however, as to the financial and engineering considerations involved in each scheme, it is not possible for the Board to pronounce any useful opinion on the merits of each, and they will not therefore attempt it.

The collector of Kurnool considers that a light railway in the Cumbum valley, which is from 70 to 160 miles from the north-west line, might be laid with advantage.

The commissioner of the Nilgiris advocates the construction of a line from Mettapolliem to Ootacamund (alluded to also by the consulting engineer for railways) and its extension to South-East Wynad. He remarks, "The great want of this splendid plateau " is a railway, which, in my opinion, would be found " not only to pay, but to afford an immense impetus " to European industry here. I consider that it " should run to Coonoor, and thence up the Kaity " valley to Ootacamund, thence viâ Neddivattum to " Gudalur and South-East Wynad, and so on to such " point as might be selected to connect it with the " projected Mysore Railway system. The late scar- " city of food supplies to the towns in this district " might have been less, if not entirely averted, if " there had been any expeditious mode of transit for " grain, &c., such as a railway affords. The opening " of the railway from Pothanore to Mettapolliem, at " the foot of the Nilgiri district, a distance of 35 " miles, has considerably improved the traffic up the " Coonoor ghat."

The collector of Cuddapah considers that a good new railway would be from Gudiyatam, in the North Arcot district, right through the sub-division taluks of the district, to join the new line at Tadpatri; the want of such a line having been much felt during the late famine, when grain had to be carried at a great cost and little speed.

The collector of Madura states that the single line of railway existing in the district was found unequal to convey the required quantity of food, that a want of sufficient supply in the markets was often felt when prices rose, and that another line of railway from east to west, opening the seaboard on the east, and connecting Palghat and Caimbatore on the west with Dindigul and Madura (recommended also by the consulting engineer for railways), would remedy the evil. He is, however, doubtful whether the project would pay.

The following suggestions have been made by other collectors, not with special reference to the introduction of food supplies in times of famine, but on general considerations of development of the resources of the country and giving a stimulus to traffic.

As regards railway extension in the Vizagapatam district, Mr. Goodrich writes:—

"In the interest of the Chhatisgarh division of the Central provinces, and generally for the good of the empire, the construction of a light railway from the eastern coast towards Raipur is extremely to be desired. Nature has provided a cleft in the range of the Eastern ghats, and no pass over those mountains has to be constructed. The elevation of the villages through which the line should run to Raipur, if that were selected as the terminus, would be as follows, taken at intervals along the line from south-east to north-west:—Vizianagram 150 feet, Parvatipur 350 feet, Rayaghada 450, Kotragarh 880, Ombadola 1,200, Arusurgar 1,000, Tel river 700, Titlagur 750, Bengamunda 776, Karrul 850, Kotingee 875, Kumuora 900, Tirbor 1,000, Sambarsingh 1,100, Naru 1,030, Jonk river 900, Boriagar 973, Belsore 925, Mahandi river to be crossed and so to Raipur, whence a light railway is in course of construction to Nagpur.

"The vast quantities of wheat grown in the Chhatisgarh plain, and the still vaster quantities which may be grown, find their nearest port at Bimlipatam or a point north thereof. The climate of the plateau of the villages in the range which this route pierces produces abundance of oil-seeds in addition to all kinds of forest produce, and the whole tract forming the upper basin of the Mahanadi would use no other salt but that which the salines of Vizagapatam and Ganjam produce, and which now supply for the larger portion of the tract. I should prefer as the easier route a more northerly course, following the 83rd parellel of longitude up to the point where it crosses the Mahanadi, and traversing the Patna and Borasambar zemindaries, tracts of very fertile and level land; but if the Nagpur line is to stop short at Raipur, and not be carried on towards Sambalpore, I would follow the line indicated, viâ, the Jonk river to Raipur. The latter line passes country somewhat more rugged than the Patna zemindari, and in the latter limestone occurs, a fact of the first importance; the plateau west of the eastern ghats is extremely poor in lime.

"The construction of a light rail or tramway would, in the opinion of those who have examined the subject, be certainly remunerative, and it appears commercially undesirable to attract the traffic of Raipur and the tracts east thereof to the port of Bombay, whilst the communications with the ports on the eastern coast (possessing so admirable a natural route, and situated at one-third of the distance from the centre of the tract) remain in a state of nature. The great respective advantage to the salt revenue is sufficient to constitute a strong argument for the grant of a guarantee, or for the construction of the line as a State line."

The collector of Nellore states that a railway from Nellore to Tripatty would be a great boon to the district. The collector of Godavari considers that a railway from Bezwada and Hyderabad would similarly greatly benefit that district.

The collector of Kistna remarks:—

"There is no railway nearer than Hyderabad on the one side and Madras on the other. The nearest point of contact is Hyderabad, 210 miles from Masulipatam, the chief town of the district, and about 110 miles from Jaggayyapet, one of the trading centres. A glance at the map of India will show the importance of continuing the railway from Hyderabad to this district. The line presents no engineering difficulties, and is crossed only by two streams of any importance, the Muniyer and the Paler. A railway from here to Hyderabad would have been of incalculable use during the recent period of distress, as supplies would have been passed into the distressed districts from this and the Godavari district by rail viâ Hyderabad, instead of taking the circuitous sea route to Madras, and thence by rail. Such a railway would, besides, be of great political and commercial importance at all times. It would greatly facilitate traffic, would stimulate trade, and should financially be a success. The sales of Government salt would be increased to the extent of not less than four or five lakhs annually."

The collector of Tanjore mentions a proposal to run a line from Nidamangalam on the South Indian line to Adirampatam on the southern coast of the district, and there is also under consideration a project for running a line from Mayaveram to Tranquebar, his Grace the Duke of Buckingham having approved it as a suitable project for a famine work, if such had been necessary. It is expected that the money required for these undertakings will, in all probability, be subscribed by the people of the district.

Regarding South Canara, Mr. Comyn says:—

"To connect Mysore and Coorg with the western coast by means of a railway from Bangalore to Mangalore viâ Mercara would be an inestimable boon no less to those provinces than to Canara; but, judg-

MADRAS.

Board of Revenue.

ing from the climate, position, past history of Canara, the occurrence of a local famine seems to be a contingency of such extreme remoteness as to make it unnecessary for the purpose of supply of food to extend railway communication to this district, were indeed such a project financially possible. At the same time, railway communication with the west coast would be of immense advantage, as a means of protection from future famines to the provinces of Mysore which are more liable to be affected by drought.*

The collector of Malabar suggests that the Madras Railway, which terminates at Beypore, should be brought down seven miles to Calicut, which is the important trade centre of the district. He also recommends that the line now being extended to Mysore should be brought on through Wynad to the coast, and should have its terminus at Calicut. The Wynad Taluk, the seat of coffee enterprise, is very much in want of a line of rail to bring down and to take manure to the estates. The mortality in Mysore also might to some extent have been averted by such a line of rail. As it was, grain was laboriously carted up the ghaut roads to Mysore at enormous cost to the consumers.

The political aspects of the question hardly come within the scope of the present proceedings; but as they form an important factor in the consideration on which railway extension depends, the Board would passingly call attention to the extent to which these west-coast lines would facilitate speedy communication with Europe.

Effect of existing Railways upon Prices and Trade.—There can be no doubt that in the recent exceptional famine season the railways had the effect of stimulating trade and equalising prices in a most remarkable manner. Leaving out of consideration the earlier months of the famine, when there was a sudden panic, and trade had not sufficiently organised itself or adapted itself to the situation, the prices of second-sort rice at the head-quarter station of each district on the 1st August and the 1st September 1877, during which months the famine was at its height, were as follows:—

	In Seers of 80 Tolas for a Rupee.	
	1st August.	1st September.
Ganjam - -	11·6	8·1
Vizagapatam -	7·3	6·2
Godavari - -	8·0	7·4
Kistna - -	7·1	7·7
Nellore - -	5·2	6·0
Kurnool - -	4·6	5·0
Cuddapah - -	5·8	6·6
Bellary - -	5·1	6·5
Madras - -	5·8	6·6
Chingleput - -	6·0	6·8
North Arcot -	5·6	5·6
South Arcot - -	6·1	6·6
Tanjore - -	not given.	7·9
Trichinopoly -	5·6	5·8
Madura - -	6·3	6·8
Tinnevelly - -	5·7	7·5
Coimbatore -	6·3	6·3
Nilgiri - -	5·2	5·6
Salem - -	5·3	5·3
South Canara -	7·8	7·8
Malabar - -	7·1	6·7

It will be observed that in September prices ranged between five and eight seers per rupee, and that the variations in the first six districts, in which there are no railways, were generally greater than in the railway districts. The highest rate was in the district of Kurnool, which has neither rail nor sea communication, and it would undoubtedly have been much higher but for the railway in the adjoining district. The collectors of Trichinopoly, Madura, and Coimbatore all remark on the small difference in the prices prevailing in their districts and in that of Tanjore, from which they drew a great portion of their supplies. A reference to the reply to question 2 will show that a much greater diversity of prices prevailed in different districts in the earlier famines before rail and other communication.

Most collectors have confined their remarks to the obvious beneficial effects of the railways during the famine. With regard to local traffic and the equalisation of prices between different parts of the same district in ordinary years the evidence is not so clear, and it is doubtful whether the convenience of local traders is sufficiently considered in the administration of the railways. The collector of Malabar, Mr. Logan, remarks that in his opinion the encouragement hitherto given has not been what it might be, and suggests a judicious reduction in rates as regards certain classes of goods. Mr. Price, the collector of Chingleput, finds carting going on just as much as ever, and does not see much in the way of produce traffic by rail.

MYSORE.

MYSORE.

Mr. Krishnaien.

The railways have certainly equalised the prices, as can be seen from the following entries:—

Price of second-sort rice per rupee during—

	July 1877.	August 1877.
	Seers.	Seers.
Kolar - -	5·9	5·5
Madras - -	6·46	6·93
Bangalore -	5·75	5·75
Kolar road station -	6	5·87
Malur - -	5·5	5·25
Mulwagal - -	5·5	5·25
Goomnaiken-pollya	5·25	4·5
Goribednore - -	5	4·5
Gudibunda -	5·25	4·5

the three last places being the remotest from the railway stations in this district.

They have also stimulated trade to a great extent, as can be seen from the accompanying figures,* annually supplied by the officers in charge of the railway stations in this district. I am of opinion that the construction of a branch railway from Kolar Road station to Gooty viâ Chintamanypet, Ganjigunta, and Bagepully in this district, and Penakonda and Hindupoor of the Bellary district, will prove very beneficial to portions of this, Cuddappa, and Bellary districts.

*Year.	Value of Articles imported and exported.	
	Rupees.	
1871–72	5,16,248	These were favourable seasons, and the articles imported and exported were valuable ones, such as cloths, sugar, jaggery, iron, &c.

1877–78	13,76,318	

CHAPTER I.—QUESTION 20.

Give an account of the water communications in the province, what kind of boats are used, what their number is, and what the nature is of the traffic they convey. State whether the navigation is capable of any improvement, and whether it is conducted in natural channels or by canals; and, if by the latter, under what regulations. What is the ordinary cost per mile of boat carriage per ton?

PUNJAB.

ajor Wace.

PUNJAB.

River Traffic.—The Punjab rivers are navigable from the point where they leave the Himalayas. And (omitting the Jumna on the east boundary of the province, which is a tributary of the Ganges), they all unite in the stream of the Indus at the south-west corner of the province. The navigable length of each, the number of boats used for trade, the nature of traffic conveyed, and the usual charge per ton per mile is given below:—

River.	Length of navigable Course roughly estimated.	Principal Marts on each River.	No. and Size of Boats.	Nature of Traffic.	Usual Charge per Ton per Mile.
	Miles.				
Jumna -	100 miles - -	Chaprauli, Baghpat, Delhi.	200, of an average size of 370 maunds (13½ tons), each aggregate capacity 2,700 tons.	Grain and fire-wood -	9 to 12 pies.
Sutlej -	450 miles from Rúnar to junction with Chenab.	Ferozepore and Baháwalpur.	50, of about 1,500 maunds each (55 tons) aggregate capacity 2,750 tons.	Trade from Ferozepore to Sukkar (400 maunds) and Kotri (600 maunds) in grain, oil-seeds, and wool, with a small return traffic of iron and sajji (carbonate of soda).	Down stream 6 pies. Up stream 5 pies.
Beas -	40 miles from border of Kangra district to junction with Sutlej.	No river traffic worth mentioning.			
Ravi	300 miles from Kashmir border to junction with Chenab.	No river traffic worth mentioning.			
Chenab -	450 miles from Kashmir border to junction with Indus at Mithankot.	Aknur, Wazirabad, Jhang, Mooltan.	1,000 boats, varying in size, usually from 500 to 1,200 maunds (18 to 88 tons), and with an estimated aggregate tonnage of 20,500 tons.	*Down stream.* Grain and oil-seeds of all kinds, also sugar, ghee, cotton, country cloth, wood, &c. *Up stream.* Iron, dates, spices, sajji, &c., a very small return trade.	7 pies.
Jhelum -	200 miles from Kashmir border to junction with Chenáb near Jhang.	Jhelum, Pind Dádan Khan, Khusháb.	200 boats, sizes from 100 to 1,000 maunds each; average size 500 maunds (18 tons). Estimated aggregate tonnage 3,700 tons.	*Down stream.* Grain and oil-seeds - *Up stream.* From Pind Dádan Khan, salt.	4 pies.
Indus -	500 miles from Attock to Sind border; and thence 90 miles to Sukkar, or to Kotri 350 miles. [The mouth of the Indus is about 130 miles below Kotri, or some 480 miles beyond the Punjab border.]	Attock, Kálabágh, Dera Ismail Khan, Dera Ghází Khan, Mithankot, &c.	700 boats, with an estimated aggregate carrying capacity of 18,000 tons, or an average of 26 tons per boat.	*Down stream.* Grain, seeds, cotton, wool, ghee, salt, &c. *Up stream.* Dates, indigo, cotton goods, metals, &c.	8 pies.

The traffic on these rivers has been greatly diminished by the opening of railways, and will diminish still more as soon as through communication by railway from Mooltan to Karráchi has been well established. The Deputy Commissioner of Lahore writes that the traffic on the Ravi has practically ceased since the railway was opened to Mooltan in 1865. The Deputy Commissioner of Ferozepore makes a similar report concerning the Sutlej, and adds that what little boat traffic still survives on that river will probably almost disappear with the opening of the through line of railway to Karrachi.

The boats used on the Punjab rivers are flat-bottomed boats with square ends. They draw very little water, and are in this respect extremely well suited to the Punjab rivers, of which the beds are wide and shallow, the stream sluggish, and the navigable courses shift continually, owing to the rapidity with which banks of alluvial deposit are formed. The principal boat-building marts are at Attock, Jhelum, and other towns near the foot of the Himalayas; the pine and cedar of which the boats are built being cut in these mountains, and easily floated down to the towns at their base. It is a common practice on all the rivers to build a boat, freight it to Sukkar or Kotri, and there sell it.

The cause which more than any other will increasingly contribute to the decline of the boat traffic is the great difficulty of obtaining return cargoes up stream. Even floating down stream in the flood season, with few demands on the energies of the boatmen at an average rate of perhaps 25 miles a day, the boats do not carry as cheaply as the railway, and the time taken is seven days for one day by railway. But in the return journeys up stream the boats do not average 10 miles a day. Moreover, the rates of freightage charged on the return journey usually are not remunerative rates, but are accepted because at higher rates the boats would get no freight. If these circumstances are considered, it will be seen that it is impossible for such river carriage to contend successfully with railways carrying direct to Karráchi or back at 5½ pie per ton per mile.

From 1862 to 1871 the Punjab Government maintained a small flotilla of three or four light-draught steamboats and barges on the Indus between Makhad and Sukkhar, but the boats never even approximately paid their expenses. Similarly up to the present date the Sind, Punjab, and Delhi Railway have kept up a steam flotilla between the termini of their Sind and Punjab lines (Kotri and Mooltan). But they are not usually able to carry grain and seeds even down stream by this flotilla at a cheaper rate than from 8 to 12 pies per ton per mile. (This statement is based on information supplied by the Company's agent.)

It is, of course, possible that engineers may succeed in building very light-draft powerful steamers, able to work at a much cheaper rate than those yet employed.

But, speaking from the experience of the past, it is clear that on the Punjab rivers neither native boats nor steamers can even approximately compete in cheapness of carriage with the broad-guage railways.

The aggregate tonnage of the native craft on the Indus and rivers confluent with it, as above estimated, is a fraction less 45,000 tons, of which the Chenab and the Indus together supply 38,500 tons. We have no reliable data of the work done by each boat. If we assume three freights down and two freights up per annum, the total tonnage carried would be 2,25,000 tons a year. The goods traffic on the Sind, Punjab, and Delhi Railway for three years past has been :—

Year.	No. of Vehicles running.	Tons Carried.			Tons carried per Vehicle.
		Up to Mooltan.	Down to Delhi.	Total.	
1875	1,978	2,44,732	1,96,439	4,41,171	223
1876	1,938	4,20,207	2,50,633	6,70,840	346
1877	1,997	4,69,521	4,93,119	10,62,640	532

(Average size of vehicles 6-6½ tons.)

The Sind, Punjab, and Delhi Company's Indus steam flotilla* carried between Mooltan (up) and Sukkar and Kotri (down) during the same period :—

In 1875 - - 80,000 tons
„ 1876 - - - 1,35,000 „
„ 1877 - - 1,50,000 „

It is superfluous to comment on the bearing of these statistics. To a province in which the existing river carriage was only able 20 years ago to carry at the outside 3,00,000 tons a year, we have added in the interval a new flotilla carrying 1,50,000 tons, and a trunk railway carrying over a million tons a year; and this last means of traffic is as yet far from its full development, for the line from Lahore northwards is only half finished, and the extension southward from Mooltan to Karráchi, though lately finished, has yet to develop its traffic.

Canal Navigation.—The canal navigation of the province is as yet entirely undeveloped. The Sutlej, Chenab, and Indus inundation canals are not navigable, nor are they capable of being made so. The Bári Doáb Canal was designed for navigation, but experience has shown that its slope is too great; and it could not now be made properly navigable without incurring very heavy expenditure. The Western Jumna Canal is navigable from its head to Delhi,* and is used mainly for transporting fuel and timber to Delhi; the dues levied are fixed by Government under the Canal Act, and vary from nine to two pie per mile per 100 cubic feet of raft; the major portion of the traffic pays four pie. The Sirhind Canal, under construction, will be navigable from Ferozepore on the Sutlej eastwards to Patiála; and a project has been sanctioned for a navigable branch joining Patiála with the Western Jumna Canal at Karnál. The Agra Canal from Delhi to Agra (which is administered by the North-west provinces Government) is navigable, and carries a small grain traffic downwards to Agra, with a return traffic in building stone.

Cost of Boat Carriage.—The statement at the commencement of this reply, as well as the more detailed statements appended, shows that the ordinary cost of boat carriage per ton per mile by native boats on the Punjab Rivers varies from four to eight pie. On the Indus and Chenab Rivers, which carry 85 per cent. of the boats, the charge is seven and eight pie per ton per mile. The small traffic on the Delhi and Agra Canal is carried at three and four pie per ton per mile. The Sind, Punjab, and Delhi steam flotilla have charged during the past two years rates averaging per ton per mile 11½ pie for the shorter distance from Mooltan to Sukkar, and eight pie for the larger distance to Kotri. It is interesting to compare these rates with those charged for food-grains on the railway between Delhi and Mooltan, and these, as stated by the railway company's agent, are :—

——	Per Maund per Mile.	Per Ton per Mile.
	Pies.	Pies.
Ordinary rate for local booking -	0·25	6·8
Special rate for grain and seeds consigned to Sind, being taken on from Mooltan by the Company's flotilla.	0·20	5·44
Special rate charged in 1876 for grain booked through to Calcutta or Bombay.	0·18	4·89

The East Indian Railway Company are now charging at Delhi and other stations on their line for consignments of grains or seeds to Calcutta and Bombay 16·6 per 100 maunds per mile, which is 4½ pie per ton per mile. Thus, to the far superior rapidity and punctuality of railway traffic, we must also add that in the Punjab it is cheaper than the native boat traffic of the country.

---

* Consisting of 11 steamers, aggregating horse-power	1,165
And registered tonnage - - - - -	2,473
Also 25 flats, with aggregate registered tonnage -	6,876
Total tonnage - -	9,349

* When the reconstruction of this canal has been completed, a total length of 127 miles will be navigable for boats, and 58 miles more for rafts.—E. WACE.

p.I. Qn. 20.

NORTH-
'ESTERN
ROVINCES
D OUDH.

Ir. Buck.

NORTH-WESTERN PROVINCES AND OUDH.

The parts which are best off in respect to water communication are the tracts which lie north of the Ganges. South of the Ganges only one river, the Jumna, is navigable, and this does not appear to be used to any very great extent. The collector of Etáwah writes :—

"Two rivers—the Jumna and Chambal—meet in this district, flowing from the north-west to south-east corners. When the railway was opened all traffic practically left them. The winding nature of the rivers, the poor country through which they pass, the shifting sandbanks, and the ravines which border them for miles render all competition with the railway impossible."

Any deficiency in water carriage by natural means south of the Ganges has, however, been more than supplied by the Ganges and Agra Canals, in the Meerut and Agra divisions.

In districts situated immediately under the Himalayas, such as Bijnor, the streams are mostly mere torrents, dry throughout the greater part of the year, and, when flowing, so rapid that any navigation is impossible. In the more eastern districts more regular streams intersect the country, flowing with steadier currents and retaining their water throughout the year; such are the Rámganga and Garra in the Sháhjahánpur district, the Gumti, the Tirhi in Gonda, the Bánganga in Basti, and the Rápti in Gorakhpur. All of these are used for the transport of grain and timber, which are floated down in the rains on boats or rafts of a size suited to the width and depth of the channel. By far the two most important rivers, from a navigation point of view, are the Ganges and the Gogra; next to them the Jumna and Gumti; then the Sárda and Rápti, together with the Rámganga and Garra, just above their confluence with the Ganges; and last, the Rámganga and Garra (higher up their courses), the Tirhi, Bánganga, and several other less important streams.

For navigation purposes the Ganges is divided into two portions by the Lower Ganges Canal dam at Narora. Above that the trade is chiefly in timber and bamboos, which are shipped on boats or rafts at wharves in the Bijnor and Sahâranpur districts, and floated down to Garhmuktesar in the Meerut, or Anúpshahr in the Bulandshahr district. Thence the timber is sent across towards Delhi or Agra by cart. In the portion of the river immediately below Narora the traffic has been diminished by the canal dam, which no boats can pass. Below Narora the first important wharf is at Farukhabad, between which town and Cawnpore there is an extensive boat trade, amounting in 1876-77 to 6,54,785 maunds. The subjoined remarks relative to the trade are extracted from the replies of the collector of Farukhabad :—

"The cargo boats in use are clumsy but strong, with a superstructure of matting sides and thatched roofs extending almost from stem to stern, the steerage being from an elevated platform, and the propulsion by broad heavy sweeps, or, when wind and opportunity offer, by a ponderous sail. In burden they range from 700 or 800 maunds to 50 maunds. The whole cargo is, in such boats, well covered in. They convey food-grains of all kinds, indigo seed, cotton, linseed, aniseed, poppy-seed, mustard-seed, coriander and caraway-seed, to Cawnpore, Mirzapur, and Allahabad; and the chief season for the departure from Farukhabad of these large cargo boats is in April, May, and June, but large numbers also go down in the rains. The cost per 100 miles of boat carriage for one maund is one anna and four pie. At this rate the cost per ton would be Rs. 2-5-4 for a hundred miles, or 4½ pies per mile.

"The smaller cargo-boats are called 'palwar,' and the larger are called 'katri.' There are 12 of the former and 90 of the latter at ferries and bridges of boats in the district from Surajpur ghát to Mehndi ghát, stationary more or less. And of boats plying up and down, there are 76 large and two small belonging to this district. The navigation on the Ganges is not susceptible, that I can see, of any improvement. The river from time to time alters its course so very much that the site of a heavy sandbank one year may be in the fairway of a channel the next. Every year, on both banks, some lands are submerged, and some again are thrown up by fluvial action.

"Boats must pick their way as they best can, and in the rains, at all events, they do not often go seriously aground."

Eastward of Farukhabad there is a gradual increase in the navigation on the Ganges. There are wharves of importance at Cawnpore and Allahabad. In the year ending March 31st 1877 the total weight of goods embarked and disembarked at the Cawnpore wharf amounted to 7,20,247 maunds, of which 6,54,785 maunds passed between it and wharves up stream, and 65,462 maunds between it and down-stream wharves. Mirzapur used at one time to be one of the chief centres of Upper India, and then river streamers with flats used to ply regularly between it and Calcutta, but the completion of the East Indian Railway in 1863 was a severe blow to its prosperity, and for six years no river steamer has visited it. Formerly Mirzapur was the mart in which the produce of Upper India was collected for export to Calcutta, and this was naturally assisted by the facility for transport afforded by the Ganges. There are about 117 boats at Mirzapur of the kind called katras and patailas, the former with flat and the latter with round bottoms; these average from 200 to 1,000 maunds in burden.

The Ganges channel is constantly shifting, and navigation is tedious and difficult; most of the traffic runs down stream, the boats being often returned empty to the wharf of consignment. Below is compared the up-stream and down-stream traffic which came to or left the Cawnpore wharf in the year ending March 31st 1877.

Trade between Cawnpore and wharves:

Above Cawnpore.	
Down stream to Cawnpore -	6,54,785
Up stream from Cawnpore -	27,143
Below Cawnpore.	
Down stream from Cawnpore -	63,037
Ups tream to Cawnpore - -	2,425

It will be noticed that the trade in the portion above Cawnpore is far larger than that below it. This is due to there being no railway between Cawnpore and Farukhabad, while there is one between Cawnpore and the chief marts below it.

Boat traffic on the Gogra is perhaps even more important than on the Ganges. In the year 1877-8, the total weight of goods which passed up and down at Darauli, on the frontier of these provinces, amounted to 43,36,741 maunds. These chiefly consisted of grain, sugar, and oil-seeds collected from the districts through which the Gogra passes on its way down from the hills. Commencing with the Bahraich and Kheri districts, the chief wharf is at Khairi, whence large quantities of grain are carried in the rains down to the Gorakhpur and Azamgarh districts and Chapra. Below Khairi is Bahramghat, where much of the timber is disembarked which is floated down the Koriáli from the Nepalese hills, the Koriáli being the name given to the Gogra where it first leaves the hills. The Gogra is also fed here by trade which comes down the Chauka or Sárda, though it would appear to no very great extent. Opposite the town of Fyzabad there is the Nawábganj wharf, where it is believed that the greater part of the Gogra trade centres. Grain and oil-seeds from Gondal, Bahraich, and Basti are collected here for shipment. The Tirhi, which meets the Gogra near Nawábganj, CHAP.I. Q

NORTH
WESTER
PROVINC
AND OUD

Mr. Buc

is used for navigation in the rains, and acts to some extent as a feeder to it. Below Nawábganj there are several small wharves in the Fyzabad, Gorakhpur, and Azamgarh districts, at which the chief trade done is in the export of sugar. The Rápti flows into the Gogra close to the town of Barhaj, in the Gorakhpur district. It is navigable, like the Gogra, all the year round, and is used for the carriage of timber and grain through the Gonda, Basti, and Gorakhpur districts. A certain amount of timber is received by it from its tributary the Kunra.

The boats used on the Gogra are very large as a rule, having a capacity of from 500 to 1,500 maunds. Those employed on the Rápti are lighter and do not exceed 300 maunds. The number of boats which annually pass Nawábganj (including those from the Tirhi) is estimated at 1,500. Of these 200 are classed as capable of carrying 1,500 maunds, 800 capable of carrying 700 maunds, and 500 with a capacity of 500 maunds. The numbers plying on the Rápti is estimated at 152, of which 15 can carry 300 maunds; 42, 200 maunds; and 95, 100 maunds.

As mentioned before, navigation on the Jumna has much diminished since the East Indian Railway has connected the towns of Agra and Delhi with down-country marts and the port of Calcutta. Above Delhi the Jumna abounds in dangerous shoals, and is not, properly speaking, navigable for boats. The completion of the railway has withdrawn most of the traffic from the portion between Delhi and Agra (inclusive), and it is not till the border of the Jalaun district that its trade becomes anything at all considerable. Between this point and Allahabad there are three or four wharves situated on the southern bank, the most important of which are Rájapur and Mau, in the Bánda district. In the year 1877 the exports from Rájapur by the Jumna amounted to 2,56,569 maunds, while the imports were 1,25,544 maunds. The trade of Mau is less than that of Rájapur, which is the principal depôt for the grain and cotton of the Bánda district.

The following remarks are taken from the Bánda Famine replies:—

"There are seven boats of the ordinary kind used for traffic in Mau, capable of conveying 1,650 maunds of merchandise, and 12 of the same kind in Rájapur capable of conveying from five to 6,000 maunds of merchandise. The traffic which is conveyed by them consists chiefly of grain, cotton, and wood."

"The traffic is chiefly from and to Allahabad, Fatehpur, Cawnpore, Mirzapur, Benares, and Patna. The average cost per mile per ton varies as to the place to or from which merchandise is conveyed."

The following are two examples of the freights from Rájapur per 100 bags of 2 to 2½ maunds each (about 8 tons):—

			Amount.	Per Ton per Mile.
Allahabad	-	53 miles	Rs. 6 0 0	nearly 3 pies
Mirzapúr	-	105 „	Rs. 24 0 0	5 „

and from Mau to the under-mentioned places for the same quantity of goods:—

			Amount.	Per Ton per Mile.
Allahabad	-	28 miles.	Rs. 6	5 pies
Mirzapur	-	60 „	Rs. 8	3 „
Benares	-	84 „	Rs. 10	5 „

Next in importance after the Jumna comes the Gumti, which, rising in the Tarái at the foot of Kumaun, flows past Lucknow down the Gogra-Ganges Doab, and falls into the Ganges near Ghápur. The river Sái meets the Gumti near Jaunpur, having followed much the same course, but not being navigable. The Gumti is navigable as far up as the Hardoi district; but since the opening of the East Indian Railway it carries little or no trade to or from that district, as the railway directly competes with it. It is not till below Lucknow that it is much used for carrying purposes, where it is needed for the conveyance of the grain of the Sultanpur and Partabgarh districts to the mart of Jaunpur. At Jaunpur the grain either takes the railway or passes on in boats down to the Ganges. The boats used in the Sultanpur district are "dongas" or dug-outs, and barges varying in draught from 100 maunds to 300 maunds. The former are used to carry down timber and firewood, and generally come from the districts west of Sultanpur (Hardoi and Sitapur). There are about 100 in the district of Sultanpur itself. The larger boats are for the conveyance of grain and oil-seeds, and they come up from Patna and Jaunpur, going on westwards for grain and oil-seeds wherever they can be found and obtained. The chief drawback to navigation on the Gumti is the extremely winding course its channel follows. This peculiarity, in which it resembles the Rápti, greatly increases the difficulty of navigation as well as enormously adding to the length of the journey.

Other navigable streams which flow through the Hardoi district are the Rámganga and the Garra: both are chiefly used for the carriage of timber and wood down to the Ganges near Farukhabad. Both these streams are only navigable in the rains for anything more than boats of two or three tons. The Rámganga above Budaun is only used for floating down rough rafts of timber from the forests at the foot of the hills. In the Hardoi district, near the point of confluence with the Ganges, both Rámganga and Garra have deeper streams, and are used for the carriage of boats between that district and Cawnpore or Allahabad. These boats vary from 500 to 250 maunds in draught, and usually carry down freights of grain, firewood, and grass. In the Hardoi district there are 16 such boats on the Rámganga and four on the Garra. For boats of this size both rivers are navigable all the year round, and can take boats of 500 maunds' capacity when swelled by the rains.

Besides the rivers and streams above mentioned, there are many others which are used in the rains to float down jungle produce from the foot of the hills. There are four such streams in the Hardoi district, which act as feeders to the Gumti, Garra, and Rámganga and others in the Basti and Gorakhpur districts, such as the Bánganga and Kunra (or Dhamela).

The only rivers in the provinces which are navigable all the year round are the Gogra and Ganges, throughout their length; the Jumna, below Delhi; the Gumti, below Sitapur; the Rápti, below Basti; and the Rámganga and Gharra, a short distance up above their confluence with the Ganges.

As regards the cost of carriage by river, it may be stated that, as with cart carriage, the freights are not so much calculated on a mileage rate as fixed fares from one wharf to another, which, though undoubtedly primarily regulated by the distance, appear in many cases to have been much modified by other causes, such as custom. The rates given by district officers are evidently obtained by dividing some of these customary fares by the number of miles which lay between the wharves of despatch and consignment.

For the Ganges,	4½	pies per mile per ton is given as ruling in	Farukhabad.
„	Gogra,	3¾	pies	Gonda.
„	Jumna,	3 to 5	„	Bànda.
„	Gumti,	6	„	Lucknow.
„	Garra and Rámganga.	4¾	„	Hardoi.

But to these must be added cost of insurance and some extra expenses, which will considerably increase the rate per mile. Some 90 per cent. of the cargoes which pass up or down the Ganges are insured by the owners against theft, fire, or wreck. The insurance is effected by men called bimawallas (bima=insurance), and is often at the rate of 1½ per cent. on the value. The "bimawalla" puts one or two servants of his own in charge of the cargo to ensure fair play, and these are paid at the expense of the insurer. These

P.I. QN. 20.

NORTH-
ESTERN
ROVINCES
D OUDH.

Ir. Buck.

extra expenses will be often found to add as much as one-fourth more to the cost per ton per mile, raising it from four pies to five pies, or even more than this. The rate per ton per mile for grain on the East Indian Railway is $5\frac{3}{5}$ pies, and the quickness of delivery by rail, and the certainty in the time of arrival, appear to more than compensate for the excess.

The rivers and streams used for navigation in these provinces have now all been noticed. The canals remain. Excluding the small irrigation canals of the Dún, Rohilkhand, and Bundelkhand, the chief canals are four,—the Upper Ganges, the Lower Ganges, the Eastern Jumna, and the Agra. All these more or less follow the course of the Ganges and Jumna Rivers, from which they are fed. The first three lie in the Ganges-Jumna Doab, while the fourth runs between Delhi and Agra, a short distance south of the Jumna and almost parallel with it. The Upper Ganges Canal runs from Hardwár, where it receives the water of the Ganges, to Cawnpore, where it pours its surplus back into the same river. It has two branches or off-shoots, one which leaves it in the Muzaffarnagar district and runs towards Farukhabad, and another which leaves it in the Aligahr district and runs through Etáwah down to the Jumna. Of all the canals only the Agra and the Upper Ganges are used for navigation, and of the latter only the main line between Hardwár and Cawnpore.

Traffic on the Upper Ganges Canal is carried on in boats or barges belonging to private individuals, but taxed by the Canal Department. The following note has been furnished from the office of the traffic manager, Ganges Canal:—

"The pattern of boat commonly in use by native traders on the Ganges Canal is a flat-bottomed wooden vessel, with an average carrying capacity of about 750 maunds each (=about $27\frac{1}{2}$ tons). All cargoes are carried above the gunwale, and are consequently exposed to the weather at all seasons of the year. There are at date 263 merchants' or private boats plying on the canal, and besides these there are 13 iron barges belonging to the Canal Department, and 20 iron and wooden boats employed by divisional officers, making a total of 296 in all. Boats are divided into three classes, and each class pays a different rate of toll. Class A. includes all boats over 10-feet beam, and these pay a toll of Rs. 20 a quarter. Class B. includes all boats between 6′ and 10′ beam, and pay a toll of Rs. 16 a quarter. Class C. all under 6′ beam, and pay Rs. 8 a quarter. Tolls may be paid in advance, or at any time during the quarter, and when payment is made the boat owner receives a printed receipt showing the date of payment, owner's name, boatman in charge, number of boat, and amount paid. Once every quarter the traffic manager goes over the whole canal, takes up receipts, and issues printed rawannas in their stead; in this is entered the owner's name, number of boat, and date up to which payment of the tolls has been made. The amount entered in the rawannas must agree with the collection paid into the Government treasuries at the different stations, and the whole must tally with the number of boats shown in the boat register book. The register is kept by the traffic manager, and is checked by the whole number of boats found on the canal when rawannas are issued.

"Great improvements as regards navigation have been made in the canal of late years, but much still remains to be done to make the stream a thoroughly reliable means of transport. The weekly closure of the Cawnpore branch, and the uncertainty of water supply during periods of minimum irrigation, are the two chief obstructions to navigation at present; when these are removed, and traders can calculate with tolerable certainty upon free navigation at all seasons of the year, it is believed that a better class of boats will be put upon the canal, and that the revenue from tolls will form a very considerable item in canal receipts, and besides this, what is of far more importance, is the facility which will be afforded to cultivators in canal districts for getting their produce to a market at a reasonable charge for carriage."

The traffic on this canal was registered at the Cawnpore end under the Department of Agriculture and Commerce in the year 1876–77. The total weight of the traffic which passed the registration post here was 12,55,151 maunds.

The trade chiefly consists in grain which is brought down to Cawnpore from wharves in the districts of the Agra and Meerut divisions. The total amount of trade which passed up and down the canal in the year 1877–78 was 1,415,250 maunds.

The freights are not regulated by the canal authorities, but boat owners are allowed to make their own arrangements, so it is difficult to arrive at any very correct estimate of the cost of water carriage to the public; but taking the average cost of carriage in the canal department, the rate would be for long distances about 2·25 pies per ton per mile, and for short distances 2·5. The collector of Mainpuri puts the rate so high as 3·5 pies per ton per mile.

The following remarks as to the navigation on the Agra Canal are taken from the Navigation Report for the year ending 31st March 1878.

There are on the canal 72 boats belonging to private persons, which can carry on an average 400 maunds a-piece. There are also 20 boats belonging to the canal authorities. The total amount of traffic carried along the canal in the year was 104,706 maunds, of which 28,609 maunds went up and 76,097 maunds went down. This is very small, considering that the canal passes by the three large towns of Agra, Muttra, and Delhi, with the two former of which it is connected by still-water navigation channels of considerable length. The down-traffic is chiefly in grain and sugar, both of which come from Delhi, where they are collected from the districts of the Meerut division. The most noticeable item in the up-traffic is sandstone from the quarries of Sikandra, near Agra. Besides the boat traffic, some 1,61,582 cubic feet of sleepers were floated down in rafts; these were supplied by the Forest Department to the Gwalior State Railway.

A toll of Rs. 20 per quarter is levied on all private boats, giving an income of Rs. 1,424. Rs. 3,933 more were realised from the tolls on rafts.

The canal has been open for navigation for comparatively speaking a short time, and the freights do not yet appear to have settled themselves. When the canal was first opened, and there was but little competition of cargoes, as much as Rs. 18 were paid for the conveyance of 100 maunds (about $3\frac{1}{2}$ tons) up stream from Sikandra (near Agra) to Delhi, and Rs. 17 down stream from Delhi to Sikandra. The effect of gradually increasing competition amongst boat owners was to reduce these freights, till the following figures were reached, apparently the minimum rates at which it will pay owners under existing tolls to carry goods between Delhi and Sikandra:—

Down stream, Rs. 6 per 100 maunds ($=3\frac{1}{2}$ tons)= $3\frac{1}{7}$ pies per ton per mile.

Up stream, Rs. 10 per 100 maunds ($=3\frac{1}{2}$ tons)= $5\frac{2}{7}$ pies per ton per mile.

As regards the profit which the canal may be expected to make from navigation, independently of the irrigation for which it was primarily intended, the following remarks of H. M. King, Esq., Executive Engineer, in charge of navigation, Agra Canal, may be quoted:—

"*I think it has been conclusively shown in one of the printed papers connected with the revised estimates of the scheme, that the net revenue from navigation can never pay the interest on the capital expended in making the Agra Canal navigable* * * * * * * *I am convinced that the most satisfactory and certain way of increasing this revenue would be to exclude all private boats from the canal, and to extend our own boating operations.*"

NORTH-WESTERN PROVINCE AND OUDI

Major Scott-Moncrieff

Note on Canal Navigation by MAJOR C. C. SCOTT-MONCRIEFF, R.E., C.S.I.

1. The reasons why the Ganges Canal is not more used for traffic are chiefly as follows :—

1. To meet the requirements of irrigation, it has not been carried past any large towns or markets. Roorkee and Cawnpore are the only two towns situated on it, and the former has no commercial importance.

2. It forms an unconnected link of navigation. The river below Cawnpore is with difficulty navigable at all except during the rains, and, practically speaking, all the down-country traffic here takes the railway.

3. The velocity of the stream is so great that up-stream traffic can only be effected with difficulty and very slowly.

4. The Cawnpore branch of the canal, 180 miles long from the Aligarh district downwards, is closed every alternate week.

5. Until the year 1873 much inconvenience was caused by the want of headway under the bridges; and until April 1877 a series of accidents necessitated the closure of one lock after another, and the consequent interruption of traffic. Both these obstacles are now satisfactorily removed.

2. To remedy the first drawback—the distance from towns—projects have been prepared for taking branch canals into Meerut (8 miles), into Khurja (2½ miles), and into Aligargh (9 miles), but hitherto want of funds has prevented their execution.

3. For a similar reason the removal of the second obstacle mentioned above has been deferred. It has been proposed—

(*a*.) to connect the canal with the Khatauli Railway station, district Muzaffarnagar, a distance of less than two miles ;

(*b*.) to connect the canal near Murádnagar with Delhi and the Agra Canal, a most important link by which large traffic might be confidently expected from the interchange of the sugar and wheat of the North-western Provinces with the cotton and salt of Rajputana and the country west of the Jumna; the connection of Delhi and Cawnpore, too, would be of value;

(*c*.) to prolong the Ganges Canal past Cawnpore to a point in the Ganges or Jumna up to which there is free navigation throughout the year, thus affording a free outlet to the grain which is in a chronic state of block at the Cawnpore Railway station.

4. The velocity of the stream in the Ganges Canal has been considerably lessened during the last few years by the interpolation of weirs and locks, and it is not probable that much more can be done in this direction. Although it is a great obstacle to up-stream traffic, it is a great help to all that goes down stream, since the boats are floated down entirely by the current; and as the down-stream traffic would probably in any case greatly exceed the up-stream, the inconvenience is not so great as might be supposed. Nor is the fourth obstacle I have mentioned. The closure of the Cawnpore branch is so well known that the boatmen know how to time their trips accordingly; and as the channel at the lower end is rarely without some water in it, boats can ply a considerable distance even in the closed weeks. The completion of the Lower Ganges Canal, now not far off, will make this branch to be run constantly.

5. Local traffic between intermediate points on the Ganges Canal is almost unknown. With the view of encouraging it, a lower rate of tollage was fixed in 1877 for smaller boats, but none have begun to ply.

6. Probably for this reason there has never been any navigation on the Etawah branch of the canal, which was originally intended for traffic as much as the Cawnpore. A costly flight of locks into the Jumna, a few miles above Hamirpur, was half-built, and abruptly stopped by the Mutiny in 1857, never to be renewed. In other respects the Etawah branch was just as fitted for navigation as the Cawnpore until the bridges in the latter were raised, but not a single boat has ever plied on it.

7. The navigation of the Agra Canal has none of the drawbacks which that of the Ganges Canal has. The velocity of the stream is very low; ample headway has been given to the bridges; branch lines have been carried into the cities of Agra and Muttra, while the Punjab Government are now connecting it with Delhi. Navigation has here, then, got every chance. The canal has only been recently opened throughout its length, and a large boat traffic may reasonably be expected on it.

8. Until the Ganges Canal is linked on to Delhi, and either by its prolongation beyond Cawnpore or by increased railway power the goods are prevented from sticking there as they now do, I do not think it would be judicious to raise the tolls higher than they now are. In 1877–78 I find the ton-mileage on the Ganges Canal was 9,500,225, and the State charge Rs. 20,227, that is, ·409 pie per ton per mile. Colonel Brownlow calculated the State charges on the Godavari in 1876–77 to be ⅔ pie per ton per mile; and he says that on the Erie Canal it is nearly 1¾ pies per ton per mile, and on the French canals ¾ pie for first-class and ⅓ pie for second-class goods. The Bengal Government, with their present policy, would, I have no doubt, quadruple our charges right off; and I cannot say for certain that this would reduce the number of boats very much, but I think it would to some extent. And really, I think, we must give up the idea of making navigation directly profitable anywhere, and rather study how the general welfare may be benefited by it. On the Agra Canal, too, I should oppose raising navigation rates, at least until the traffic has become developed.

9. At one time I was very hot on a Government boat train, but after my experiences on the Deltas and in Orissa I am not. If navigation were hanging back on a new canal, I think it would be an excellent plan to introduce it by a fleet of Government boats, but I would sell them as soon as the traffic had fairly sprung into life. With a Government train there is the danger of choking off private traders. There would be a difficulty in suddenly expanding to meet the wants of a year of drought. And, in short, I think the *onus probandi* lies with those who would propose that Government should be carriers, and my opinion is that the present system could not thereby be improved. There are regular native agencies who work with simple and inexpensive apparatus, and I think they are better suited to the people than anything we can substitute.

Water Communications.—No other part of India possesses such magnificent water communication as Bengal Proper. It may be said to be its distinguishing physical characteristic. The Ganges flowing from the north-west, and the Brahmaputra from the north-east, meet, and flow to the sea through the great rice-growing delta of the province. They are navigable throughout the year, and almost all the

P.I. Qn. 20.

ENGAL.

Toynbee.

other rivers of Bengal are feeders of or distributaries of these two main lines of communication, as a glance at the accompanying map will show. Numerous inlets and outlets permeate nearly all the districts of the country.

The following description of the great trade routes of Bengal, which are chiefly water routes, is taken from Mr. Cotton's "Report on the Internal Trade of Bengal" for 1876–77:—

Trade Routes of Behar.—From the three frontier northern sub-divisions of North-Behar there are two great currents of export trade, the one making south-west and the other south-east towards the Ganges. Of the former the staple is rice. The routes followed by this trade are overland, crossing the courses of the numerous rivers which flow through the country. This trade is entirely restricted to the dry months of the year; it commences in December and it ceases in May, herein naturally following the condition of the weather and the seasons of harvesting. The trade loses volume as it proceeds, for it largely supplies the Tajpur and Hajipur sub-divisions of Tirhut and the Beguserai sub-division of Monghyr, regions which are more profitably devoted to non-food staples and to rubbee crops than to rice. For the most part this traffic is not river-borne.

The second current of export trade from Behar tends southwards in the first instance to the Ganges, or to the marts situated on the larger affluents of the Ganges, and then it sets south-east to Calcutta. This trade is chiefly in oil-seeds, and it is to a large extent river-borne. The other articles of export trade find their way along this route to Calcutta, with the exception of tobacco, which is exported to Patna, the North-Western Provinces, Central provinces, &c.

Generally speaking, it must be said that the rivers of Behar, other than the Ganges, are ill suited for navigation. They are rarely navigable except during the rainy season, and at that period are not unfrequently rapid and dangerous. In consequence, the greater part of the trade of Behar is carried overland along the roads with which the province is now so well provided, and the river-borne export trade is brisk only during the months of July, August, September, and October, when the rivers are full of water.

Trade Routes of Northern Bengal.—From North Behar it is an easy transition to the tract of country technically known as Northern Bengal, which comprises all the districts of the Rajshahai and Cooch Behar division. This tract of country may be roughly described as extending from the Mohananda on the west to the Brahmaptura on the east, and from the Tista on the north-east to the Ganges on the south-west, comprising a portion of the districts of Purnia and Jalpaigori and the whole of the districts of Rangpur, Dinajpur, Bogra, Rajshahai, Pabna, and Malda.

The Mohananda and the Tista take their rise in the Darjiling hills in close proximity with each other at the north-western corner of this tract of country; and taking the Mohananda as the western boundary, and the Brahmaputra as the eastern boundary, it may be said that the general flow of all the Northern Bengal rivers south of the Tista is from north to south. Some flow to the south-west, and eventually empty themselves in the Mohananda, while the rest meander away to the south, and become merged in the Chullun bheel, whence in the rains they afford easy communication with the Ganges or Brahmaputra.

The line between these two sets of rivers is distinctly marked. The Purnabhaba, on which river the town of Dinajpur is situated, runs into the Mohananda, and all rivers to the west of the Purnabhaba do the same; while the Atraie, and all rivers to the east of it, flow into the Challan bhiel or the Brahmaputra. The space, therefore, between the Purnabhaba and the Atrai is the watershed of the whole country. The produce sent along the Purnabhaba and the rivers to the west is exported up country; the produce of the Atrai and of the rivers to the east finds its way to Calcutta.

These rivers are traffic routes for three or four months of the year during which the rains last. During the remaining eight or nine months of the year there is not sufficient water in them to afford an outlet for the products of the country, and consequently all goods must be carted to some point where there is direct water communication with the Ganges or Brahmaputra, or must remain where they were produced until the rivers open at the end of June. The rivers Jabuna, Nagor, Gur, and Baraloi, all in the southern districts, are navigable by moderate-sized craft for a longer period than others.

The staple productions of the country are rice, jute, and tobacco. The greater part of the rice crop is not harvested till January, by which time the rivers are dry; and as rice is so cheap that it will not stand the expense of any lengthened land carriage, it remains mostly stored up in the district for months, until the rivers begin to open again, when it is sent off in great quantities. Jute also is a crop that does not fit in with the rise and fall of the rivers. It is a crop which is grown in the rains, and which is only coming to hand when the rivers are beginning to fall, so that only the very early samples of the new crop get down that season, unless it is grown in the immediate vicinity of a river open all the year round. Tobacco, on the other hand, comes in in April, and has therefore only to be kept for a couple of months before it is in the market, if the cultivators and dealers choose to come to terms as to the price. The cultivation of tobacco, however, is local and limited, and, as a rule, it may be fairly said that for some eight months of the year there is no natural outlet for the main productions of the country. The plan usually adopted by those engaged in trade is, therefore, to settle down on the banks of one of the rivers, and then accumulate, through the agency of paikars or by purchasing on their own account, the goods which they intend to send down country. Thus on the Atrai there are to be found, at distances varying from five to 10 miles, marts doing a larger or smaller trade which are depôts for the receipt of the produce of all the surrounding country, and the same is the case in a greater or less degree with all the rivers in this part of Bengal As long as the rains go on, and the rivers keep full, the process is easy enough, as the largest boats can then go up the Atrai quite easily; but at the end of October, when the rivers begin to fall, a great change occurs, and articles for export have to be carted over very bad roads, often over none at all, till they reach some place where water communication with the Ganges is available for boats of some size. But as the season goes on the size of the boats diminishes even at those places where there is most water, and rafts and dinghees of the lightest construction have to be brought into play. It may be expected that the opening of the Northern Bengal Railway will afford a very advantageous opportunity for the ready transit of produce, and so relieve the block which at presents sadly impedes the commerce of the country during the greater part of the year.

Trade Routes of Central Bengal.—The Nuddea rivers is a general name for the extensive network of affluent and effluent streams of which the Bhagirathi, the Jallinghi, and the Matabhanga are the principal channels.

The loop-line of the East Indian Railway is in a great measure in direct competition with the Bhagirathi River route, and doubtless the railway has been the principal cause of the large reduction of the river traffic. The Bhagirathi now only carries 40 lakhs of maunds in the year, whereas formerly it carried 100 lakhs, and in one year, 1842–43, the registered traffic amounted to 120 lakhs. The whole of the cotton, the whole of the indigo, and more than half the saltpetre and sugar, as well as a large proportion of other staples, have been attracted from the river by the railway. But with every allowance

Chap. I. Qn. 2

Bengal.

Mr. Toynbee

made, it would seem that the river has deteriorated as regards navigation. Even now a considerable quantity of traffic, amounting to about two lakhs of maunds in the year, comes into Calcutta from Behar by the Calcutta canals. The ordinary channel for Behar produce is along the Bhagirathi River; but during the dry season the up-country merchants, if they export at all, are now compelled to avoid the Bhagiruthee and to send their boats the long route down the Ganges as far as Kashtea, along the Gorai, the Modhamatty, and Atharabanka, and so by Khulna into the canal routes.

Similarly, the Eastern Bengal Railway is in direct competition with the Matabhanga, and, to a less degree, with the Jallinghi River route; and as regards the local trade of the district of Nuddea, and, to a smaller extent, as regards the trade of the neighbouring districts of Rajshahai and Pabna, it has certainly succeeded in diverting a large part of the traffic. But merchandise of which the bulk is considerable, such as food-grains, oil-seeds, and salt, still ordinarily adheres to the old route. The railway carries nearly the whole of the cotton piece-goods, indigo, chillies, turmeric, and sugar. The jute carried by the railway has also reduced the Nadiya River traffic, although the bulk of the river-borne jute is not carried along these rivers, but comes from North-eastern and Eastern Bengal along the Sunderbuns route into Calcutta. The traffic of Northern and Central Bengal is carried by the Jallinghi and Matabhanga.

Trade Routes of the Delta.—It is impossible to give in this place a systematic account of the great river system of the districts of Jessore, Faridpur, and Backergunge. The interlacings of the rivers are so complicated, and the swamps in which the channels lose themselves or merge with other streams so perplexing, that the thread of the narrative must be constantly interrupted, and it could only be made intelligible to the reader by frequent reference to a map on a large scale.

Trade Routes of Eastern Bengal.—The whole of Eastern Bengal is a network of river communications which afford unrivalled facilities for the carriage of merchandise. The largest rivers are the Jamuna and Megna, both off-shoots from the Brahmaputra. The Megna is formed from the confluence of the Surma and Brahmaputra.

Trade Routes of Western Bengal.—On the western side of the Gangetic delta the rivers have little or no connection with the main system of the country. The Damudar, the Rupnarain, and the Kasai may all be said to join the Hooghly between Calcutta and Saugor Island; but they are isolated rivers which have sprung from the plateau of Chota Nagpore, do not help to form the delta, and are independent in character. They are very unfavourable for navigation, being shallow in the cold weather and violent during the rains. They carry but little trade, and the surplus produce of Western Bengal, so far as it is not tapped by the Hooghly River, is borne away by the roads and the East Indian Railway to Calcutta.

The trade of the Midnapore district is greatly facilitated by the two canals which run through the district, viz., (1) the Hidgellee Canal, 32 miles of which are open, leading from Geokhally at the junction of the Roopnarain and Hooghly to the Rasulpore River, and (2) the high-level canal. Besides the Hidgellee, or low-level canal, there is an alternative route called the Bahirgang, which follows the course of the tidal estuaries as far as the junction of the Hooghly and Rasulpore, and thence proceeds up the Hooghly. This route is exposed and dangerous during the stormy months of the year; but, on the other hand, being entirely tidal, it admits of being traversed in one ebb and two floods with hardly any labour or exertion, and without the payment of toll. Hence the bulk of the traffic only goes up the canal in March, April, May, and October, when bad weather may be apprehended, but in the other months only the more valuable cargoes use it. The high-level canal does for the north, centre, and west of the district fully as much as the low-level canal does for Hidgellee and North Balasor, with the difference that, except for the last two reaches there is no "Bahirgang" to compete with the canal for the bulkier cargoes.

Trade Routes of Orissa.—The three great Orissa rivers, the Subarnrekha, the Baitarni, and the Mahanadi, have a direction generally parallel to one another and a south-easterly course, the two former rising in Chota Nagpore and the latter in the Central provinces. The rising ports of Chandballee and Mourigong are about 25 miles inland, on the banks of the Baitarni River. The two places are nearly opposite to one another, Chandballee being to the north in the Balasore district, and Mourigong to the south in Cuttack. The Mahanadi is navigable for boats for 460 out of its 520 miles, and near Cuttack is about two miles in breadth during the rains. The trade of Orissa is, however, far more even than in the case of Midnapur dependent upon its canals than upon its rivers.

These canal routes may be described separately. Beginning with the northern part of the province, we have the Sone canals connecting the upper reaches of the Sone with the Ganges by two branches—the one passing through the Shahabad district and locking into the Ganges near Arrah, the other through the Patna and Gya districts into the Ganges near Patna. On both these canals the traffic is as yet in its infancy, but may be expected to develop to a very large extent.

The Calcutta circular canals afford communication for an innumerable fleet of small country boats with the creeks and rivers running into the Sunderbuns. The Midnapur canals have been described above.

In Orissa, Cuttack, the capital of the province, is connected by canal with its chief port, False Point. Chandbally, another port, is also now placed in direct water communication with Cuttack, and the completion of a contemplated low-level canal to Midnapur by Balasore, which would probably not cost more than 30 lakhs of rupees and would yield a fair profit on outlay, would place Cuttack within reach of Calcutta by inland water communication.

The boats chiefly employed on the water routes above described are the ordinary kind of country boats which have been in use for centuries. In carrying tea and valuable products river steamers are employed, but to a comparatively small extent, as the table given in the answer to question 17 will indicate.

It is quite impossible to give the number of boats employed. The general rate for boat carriage throughout Bengal is three pie per ton per mile, exclusive of tolls.

The navigation of the various small creeks and inlets which permeate in all directions is doubtless susceptible of improvement, especially in Eastern Bengal. The Road Cess Act provides for such improvements, and they are being gradually carried out from road cess funds.

CENTRAL PROVINCES.

Central Provinces.

Mr. Nicholls.

There are no canals in these provinces. The boat service at the ferries, lying on the principal traffic routes, may be said to be adequate. Except at the ferries and for the rafting of timber, practically speaking, water communication is limited to a part of the Weinganga, from 10 miles from the head-quarters

HAP. I. QN. 20.

CENTRAL PROVINCES.

Mr. Nicholls.

of the Balaghat district to Bhandara, and thence downwards through the Chanda rice-field, with occasional interruptions to Sironcha, and again from Seorinarain on the Mahanadi to Cuttack. I am not prepared to say that positively no improvements to the navigation could be affected at a reasonable expense, but it is believed that nothing of much importance in this way could be undertaken with any hopes of an adequate return for the capital which would be required.

The Deputy Commissioner of Sambalpur gives the following account of the Mahanadi boat traffic:—

> "There is water communication by the Mahanadi up the river to Seorinarain and down the river to Cuttack. The boats used are rather narrow with flat bottoms, and their dimensions, &c. are—
>
> Length - - 30 to 80 feet.
> Breadth - - 3 to 7 feet.
> Capacity - - 30 to 250 maunds.
> Crew - - 4 to 13 men.
>
> "As to how many boats of each class are available, the following figures were put before me last year, when a report was being drawn up for the Quarter-master General's Department. I cannot answer for its absolute correctness, and am now having a fresh inquiry made, the result of which will be reported if desired—

Name of Class.		Divisions.	Load, Maunds.	Crew.	Hire per Mensem.	Number available.
3	pahal	60×2	30	3	Rs. 22	70
$3\frac{1}{2}$	„	60×3	35	4	„ 30	57
4	„	$61 \times 3\frac{1}{2}$	50	5	„ 36	75
$4\frac{1}{2}$	„	62×4	80	6	„ 48	60
5	„	$67 \times 4\frac{1}{2}$	120	7	„ 58	52
$5\frac{1}{2}$	„	$70 \times 4\frac{3}{4}$	150	8	„ 68	30
6	„	$75\frac{1}{2} \times 5\frac{1}{4}$	180	9	„ 76	12
$6\frac{1}{2}$	„	$77 \times 5\frac{3}{4}$	225	10	„ 84	3
7	„	80×6	250	13	„ 100	1
		Total number of boats available			-	360

"Since the above return was submitted I have heard that the number is much larger, and the most careful inquiries will now be made, but this will take time. The boats are usually employed in bringing up salt, piece-goods, brass work, cocoanuts, &c. from Cuttack for this and the Bilaspur district, and taking down to Cuttack grain, wheat, oil-seeds, myrabolans, lac, &c.

"The smallest boats can ply all the year round, the largest only for six months, viz., during the rains and early part of the cold weather.

* * * *

The cost of carriage per ton per mile, at the rates now prevailing, is $2\frac{3}{4}$ annas."

For Balaghat, I would refer to page 54, where Major Bloomfield mentions the traffic in the rains. The present Deputy Commissioner writes:

> "There is water communication during the rainy season on the Weinganga from Chizgaon, 10 miles from the Sadar station, down the river. About 50 canoes are employed, of which only 15 belong to this district; the rest come from the Bhandara district. The traffic is in gram, rice, wheat, urad, tur, &c.
>
> "I do not personally know, but am informed that the navigation during the rains between Chizgaon and Bhandara is easy, and that the rocks are then covered. * * The cost of boat hire per ton per mile is about one anna."

The Deputy Commissioner of Bhandara writes:—

> "The Weinganga River and a portion of the Baghnaddi (in the direction of its junction with the former) are navigable during the rains only. I do not think the navigation is capable of improvement. It is only during the few rainy months that boats can ply on these rivers, owing to the number of rocks which cover their beds every here and there.
>
> "There are about 225 small canoes (being simply trunks of trees hollowed out) used for the carriage of merchandise. There may be probably 200 more which could be made available in case of necessity. These are only used for the transport of grain; a canoe will carry from $1\frac{1}{4}$ to $1\frac{1}{2}$ ton, at an average cost of 2 annas 4 pie a mile.

The following account is taken from the Bhandara Settlement Report:—

> "During the early bursts of the monsoon navigation is not attempted; but ordinarily, during the rainy season, canoes ply on the river in every direction. Its broad bosom now takes the place of the fair-weather roads; its current carries the traveller down rapidly, but a voyage up stream is tardy and toilsome. The barriers at Chizgaon and Tiddi† prevent river traffic from becoming general. In fact, navigation is bounded by these impassable rocky steps. * * Rice and gram are carried in canoes scooped out of the trunks of trees. These canoes are in length about 30 feet, and have been hitherto made of teak trees from the Panabaras forest. But now, the bijasal is also coming into use for canoe purposes, as the supply of large teak is falling short. Fifteen years ago (from 1867) a teak canoe was obtainable at Rs. 60 or Rs. 70, now they run from Rs. 125 to Rs. 150. A good canoe lasts from 25 to 30 years. It has been computed that 100 canoes and 400 watermen are employed in the navigation of the Weinganga during the five months that it is open, and that 23,000 maunds of rice and other grain are brought down by it."

The Weinganga, below the junction of the Kanhan, again becomes navigable for these small river boats, and so continues through the Chanda rice country to Garcharoli; but from this point to a point level with Ahiri, in the south of the district, navigation is much more difficult. From Ahiri, which is considerably below the junction of the Wardha River, the Weinganga again becomes open, and this open section continues to a distance far below Sironcha. But the river traffic in this district is not considerable, and is confined to the months of August, September, October, and November. There is some amount of river traffic in the Sironcha section of the Godavari and of the Pranhita.

The late Officiating Deputy Commissioner writes thus:—

> "There is water communication through the whole length of the Sironcha taluk, and also along the length of the other three taluks; but except in very full floods, no boats could at present descend from the Sironcha to the other taluks. There used formerly to be boats on the upper portion of the rivers here, but all of them have now rotted away. There are no boats on the lower portion of the Gadavari in this district, but they can be procured from Rajamundry, and return boats can also sometimes be procured. A steamer too, occasionally during the rains, comes up as far as Tarlagudiam, which is nearly opposite Enchampilly and just below the second barrier on the Godavari. The boats used are flat-bottomed. These boats take down wheat and other grain, fibres, lac, turmeric, horns, &c., and bring up cloth, spices, &c. The ordinary cost per mile for one ton by boat carriage is 1 anna $1\frac{1}{2}$ pice, but for goods coming up stream the charge is about 1 anna 5 pies per mile. By steamer the charge is about 1 anna 2 pie per mile per ton."

In 1876–77 the river imports and exports of Sam-

---

† At Tiddi and Magardhokra, above the junction of the Kanhan coming from Kamthi, there are heavy falls and dangerous whirlpools.

Chap. I. Qn. 20.

Central Provinces.

Mr. Nicholls.

balpur and Sironcha in connection with the Eastern coast are thus shown in the annual trade report:—

	Imports.		Exports.	
	Quantity in Maunds.	Value.	Quantity in Maunds.	Value.
Sambalpur	4,866	2,46,548	56,000	1,86,179
Sironcha	30,193	92,699	355	1,715

Grand schemes for the navigation of the Godavari have absolutely failed and have been abandoned, and nothing practicable has been suggested with regard to the navigation from Sambalpur to Cuttack.

BOMBAY, SIND.

Bombay, Sind.

Colonel Haig.

The Indus is the great highway of traffic in Sind. The Indus steam flotilla consists at present of 14 steamers and 36 barges, and the country craft registered by the Conservancy Department number between 4,000 and 5,000. The number registered in 1876–77, when river traffic was exceptionally active, was 4,655. These vessels consist of the "Zorak," a large boat built in the Punjab, and the common Sindhi boat. The former is an excellent cargo boat, sometimes of 70 or 80 tons; the latter ranges from six or seven to 60 tons. The charge for goods by steamer is on the average—

Up river	Down river
9·48 pies	6.27 pies

per ton per mile.

By native craft the charge is—

Up river	Down river
2½ pies	3 pies

per ton per mile.

Cargo up river is not so easily obtainable by native craft as down river.

34. The remaining questions of Chapter I. seem to have no applicability to this province, and may therefore be passed over.

MADRAS.

Madras.

Board of Revenue.

The main line of water communication in the presidency is the Buckingham Canal, which starts from the southern end of the Commamoor Canal in the Kistna district, and will, when completed, run right through the districts of Nellore, Chingleput, and South Arcot to Vedarnium in Tanjore. The total length of water carriage on this line, inclusive of the Commamoor Canal, will then be 598 miles, which may be divided into sections, as shown hereunder:—

	Miles.
Commamoor Fresh-water Canal.	
From Cocanada fresh-water canals viâ Dowlaishvaram, Ellore, and Bezwada to the Junction lock of the Buckingham Canal -	192
Buckingham Salt-water Canal.	
From Junction lock to Madras and Adyar (completed) - - - - - -	204
From Madras and Adyar to Markanum (completed) - - - - - -	65
From Markanum to Cuddalore (not completed)	37
From Cuddalore to Negapatam (portions completed) - - - - -	68
From Negapatam to Vedarnium (completed)	32
Total distance from Cocanada to Vedarnium	598

It is expected that the Madras Irrigation Company will shortly complete their arrangements for navigation, and there will then be canal communication between Kurnool and Cuddapah. The other canal communications in the presidency may be said to be all local. In the Godavari district, besides the above-mentioned through canal, there are canals from Rajahmundry to Amalapur, Narsapur, Mogaltur, Samulcotta, Rajolu, Tanuku, and Coringa, besides some other minor navigable channels. All are connected with the Godavari anicut, and are regulated by means of locks. In the Kistna district, in addition to the Commamoor Canal, one runs from Bezwada to the port of Masulipatam, and another from Bezwada to the salt station and seaport of Nizampatam. A third canal is navigable for about 21 miles to Kollur. The canals in the Kistna district are usually closed for about three months in the year to clear out the silt.

The only other district in which there is any important canal communication is Malabar, where there are extensive natural backwaters running parallel to the coast, and joined by artificial channels forming three sections of coast canal not as yet connected with one another, viz.:—

	Miles.
From Cochin to Tirur - - - -	78
From Beypore to Badagara - - - -	43
From Boliapatam to the Canara frontier -	22
Total - -	143

In Ganjam there is a short and not much used canal connecting the Chilka Lake with the port of Ganjam.

River navigation, to any extent worth speaking of, is confined to the Godavari and Kistna Rivers on the east coast, and to the numerous streams from the Western ghauts, in the districts of Malabar and Canara, many of which skirt the coast for miles before actually turning into the sea. The Chilka Lake is a means of communication between Ganjam and Puri.

With reference to the kind of boats used, and their number, the nature of the traffic, &c., the collector of the Godavari gives somewhat indefinite information. He merely says, "Cargo and transit boats are "used on them. They generally afford good accom"modation. They carry passengers, and all sorts of "cargo, paddy, cholum, ragi, and other articles of "merchandise are brought in from the interior. "These boats number about 3,000 or 4,000. The "canals are all connected with the Godavari anicut, "and are regulated by means of locks."

The collector of the Kistna is more explicit, and says:—"The superintending engineer estimates the "number of boats plying in the Kistna and Godavari "canals at no less than 2,000. They are of various "descriptions, with a tonnage of from 5 to 40 tons. "They carry both passengers and goods, but the "greater number carry goods only. They are chiefly "used for the carriage of grain and cotton, and there "is also a constant passenger traffic. All boats using "the canal are obliged to take out licenses or pay "a special fee. The rates differ according as they "are passenger or goods boats only, and of passenger "boats there are two classes. The cost of carriage "by boat is very much cheaper than by road, and "may be taken at three pies and upwards per ton per "mile."

The following particulars are taken from the Public Works Administration Report for 1877–78:—

Godavari District.

Passenger boats - - -	120
Cargo boats - - - -	1,671

Value of cargoes Rs. 36,965,022 (arbitrary valuation).

Navigation receipts, Rupees 44,927.

Chap.I. Qn. 20.

MADRAS.

Board of Revenue.

Kistna District.

Passenger boats	36
Cargo boats	628

Value of cargoes 6,108,671 (arbitrary valuation).
Navigation receipts, Rupees 17,184.

The charge for boat licenses in the Godavari district was raised in 1877 from one rupee to two rupees a ton, and it is in contemplation to raise it in the Kistna when the result has been observed.

A copy of the rules and bye-laws will be found in the appendix.

From Nellore it is reported:—"The boats in use "here are flat-bottomed, from 1 to 40 tons burden, "with masts and sails. The boats generally used by "passengers are called top-boats. They carry five "tons. One-third of the deck is covered in with a "waterproof planked roof and curtained with mats or "cloth. Oil-seeds, chillies, grain, firewood, and "various other kinds of produce are carried to and "fro. During April and May and June the average "monthly imports by the canal to Madras amounted "to 20,000 tons, most of which went from this "district. There are about 2,000 boats carrying "about 15,000 tons on the canal, of which perhaps "about 100 belong to this district, where most of the "canal is new * * * * * * * * * "The ordinary cost per mile of boat carriage for one "ton is about 3 pies, but it varies greatly now, "because there are not sufficient boats to meet the "demand. This will soon be remedied. Large "cargo boats often carry at 2 pies per mile per ton."

The collector of Chingleput writes as regards his district:—"The use of the canals is chiefly to carry "the salt manufactured by Government; a con- "siderable quantity of firewood is carried, and some "produce and dry fish; they are also much used for "passenger traffic. The total number of boats on "both canals is 1,311. Of these 437 are passenger "and 874 cargo * * * * * The ordinary "cost of boat-carriage per mile for one ton is 5 pies." Mr. Price also appends a copy of the rules connected with the Northern Canal, and says that the southern are under the license system.

The canal communication in South Arcot is at present in such a transition state in connection with the southern extension of the Buckingham Canal that it is unnecessary to reproduce here the details given regarding existing boats and traffic.

With regard to the canal from Negapatam to Vedarnium, which at present is an isolated section, the collector of Tanjore writes:—"There are 34 boats "(similar to sea-going cargo boats), and of size "varying from 3 to 10 tons in capacity, engaged in "carrying the salt and tobacco from Vedarnium, and "a toll in the shape of a registration fee of 4 annas a "year is levied on each boat plying on the canal. "The cost of carriage of one ton is 6 pies per mile."

In Malabar the navigation of the artificial channels connecting the backwaters is under no regulation. There is only one substantially built lock at which a trifling fee is levied on all boats passing through it.

The above remarks have had reference chiefly to artificial canals. With regard to river navigation it may be stated that the Godavari is navigable, in reaches, for the greater part of the year throughout the whole length of the district above the anicut, and two large steamers are worked on it. Below the anicut it is permanently navigable as far as the tide goes, and up to the anicut during freshes. The Kistna is also navigable for a part of the year, but is very little used for the purpose.

In Malabar and Canara the rivers and backwaters are freely used for navigation, and, as already stated the natural facilities in the former district are supplemented by artificial channels so as to form a continuous line of coast canal. The collector of Canara writes:—"There is water communication between the "sea coast and the interior by means of the numerous "rivers which rise in the Western ghauts. These "rivers connect most of the seaports with the villages "in the interior to some distance, and a brisk trade, "chiefly consisting of rice, betel-nut, cocoanuts, and "firewood, is carried to the coast. The merchandise "is conveyed in boats of various sizes and capacities "from ½ a ton to 4½ tons, according to the depth or "shallowness of water in each river. The number of "these boats amount to 3,794. The navigation is "carried on under no regulation, and is not capable "of improvement except at a heavy expenditure. "The ordinary cost per mile of boat carriage for one "ton is about 1 anna."

In Malabar the condition of river and backwater navigation are very similar. The collector has omitted to give the cost of carriage per ton, and his estimate of the number of boats, 1,994, seems unduly low. The artificial canals connecting the backwaters are not, as a rule, in a very efficient state.

With regard to improvements to the existing water communication the collector of Godavari refers to projected extensions, and the collector of Chingleput suggests the improvement of the existing navigation by the use of steam towing-boats and dredges, and the construction of proper landing wharves and basins. As regards the proposal to introduce steam tugs, the Board would observe that the essential advantage of a canal is its cheapness. Steam tugs involve increased expense, especially in this country, and, although increased speed might be obtained, it is in no way a desideratum under present circumstances. The extension of the Godavari system, and the other improvements referred to by Mr. Price, would no doubt be very desirable in themselves; but the Board have no data before them on which to form an opinion of their financial practicability. The collectors of Malabar and Canara advocate the completion of the West Coast Canal, for which the existing backwaters afford such great natural facilities, and if canal extension is to be carried on from provincial funds, as is now being done in the case of the Buckingham Canal, the Board consider that the West Coast Canal should be the work next taken in hand; but with the information at present before them, they are not prepared to offer an opinion as to whether the provincial funds available for communications can be best expended on roads or on canals.

In connection with the question of water communication, it may not be out of place to mention the facilities afforded to coasting traffic by the British India Steam Navigation Company, which carries on a weekly service in both directions between Calcutta and Bombay, calling at the under-mentioned ports in the Madras presidency:—

Gopaulpore.
Calingapatam.
Bimlipatam.
Vizagapatam.
Cocanada.
Masulipatam.
Madras.
Negapatam.
Tuticorin.
Cochin.
Beypore.
Calicut.
Tellicherry.
Cannanore.
Mangalore.

In the case of Calingapatam and Masulipatam, however, it is only every alternate steamer that calls, and the ports of Cochin, Beypore, Calicut, Cannanore, Tellicherry, and Mangalore are frequently inaccessible during the prevalence of the south-west monsoon, and the steamers then stop at the small port of Narrakal, in the Cochin territory. In the case of Mangalore it may be said that the port is closed throughout the whole period of the monsoon.

In addition to the above there is a fortnightly service to and from Rangoon, calling regularly at the ports of Masulipatam, Cocanada, Vizagapatam, and Bimlipatam, and once a month at Calingapatam, Barwah, and Gopaulpore.

CHAP. I. QN.

CHAPTER I.—QUESTION 21.

Is there any portion of your province into which, by reason of the want or the badness of the roads or other means of access, or of local or temporary disturbing causes of weather, &c., it might be impossible or difficult for unassisted trade in time of scarcity to throw enough grain to feed (say) one-quarter of the population for six months? If there is such a part, state where it is, what is its area and population, and what are the special difficulties to be overcome, and how they might best be removed?

PUNJAB.

PUNJAB.

Major Wac

The principal difficulty in answering this question for the Punjab is, that the records of the years 1860–61 and 1868–69 (the years of famine in the Punjab) go to show that, partly owing to the movements of people towards the centres of trade and towards the tracts least famine-stricken, and partly owing to the activity of trade and carriage, a failure of food supplies, such as the question contemplates, is unlikely in any part of this province.

It is clearly unnecessary to consider the question in respect of the districts traversed by and immediately adjoining the railway lines. But it may be of use to give the data which justify the assumption of the sufficiency of trade to import a half-year's food for a quarter of the population in the tracts more distant from the railway; viz., (1) the Hissar division, and (2) the Derajat division and Jhang district.

(1.) Of the Hissar division the population is 1,232,435 souls. A fourth of this population, consuming, at famine rations, say ½ ser per head per diem, would require a daily supply of say 4,000 maunds per diem. Delhi is 10 marches from Hissar, and Sirsa is a similar distance from Ferozepore and the Sutlej. On an average, we may assume that a camel would deliver at the various points in the division where grain was wanted two loads in a month, 4,000 maunds, equal 800 camel loads, or say 1,000. So we should need 15,000 camels. The Hissar division alone possesses over 25,000 camels, and over 11,000 carts. The latter will carry on the worst road twice as much as a camel.

(2.) The aggregate population of the Deraját division and Jhung district is 1,339,278. A fourth of the population would consume (at the same rate as above) say 4,200 maunds per diem. As Dera Ismail Khan is 12 marches from Mooltan, the amount of carriage required would be a little more than in the previous case, say 20,000 camels. The Deraját and Mooltan divisions together possess 88,000 camels; and, besides these, river carriage by native boats would certainly be largely used.

(3.) A third possible case can be suggested; viz., such a very unusual failure of autumn crops as occurred in 1877 in the hill tracts of Hazára. The population of these tracts (tahsíls Abbottabad and Mansahra) is 227,561; a fourth of this population would consume, at above rate, say 750 maunds per diem. With camels delivering from Rawalpindi two loads a month, about 2,850 camels would be needed to keep up the required supply. The adjacent district of Rawalpindi alone possesses 7,600 camels. Camels can work on the main roads of Hazára.

It seems unnecessary to enter into further calculations on this subject.

NORTH-WESTERN PROVINCES AND OUDH.

NORTH-WESTERN PROVINCES AND OUDH.

Mr. Buck.

A road map has been prepared in which those areas are marked off and coloured grey which appear from the district officers' replies to be more or less cut off from communication with the rest of the provinces for some portion of the year; on each tract its area (in square miles), and population have been marked, if it has been possible to ascertain these from the district reply or any other source (such as settlement reports). The condition of each of these tracts will be noticed separately, and any proposals will be quoted which have been made by the district officer for improvement of its communications. All the tracts lie on the borders of the provinces in country either hilly or close under hills, and intersected by streams and torrents, which make the maintenance of practicable roads extremely difficult. It is in the rainy season, when the streams are full, that the communications are interrupted; at other times of the year it would appear that all of the tracts are more or less accessible.

The distribution of these tracts, as marked on the map, is very irregular. The Gonda district, for instance, is represented as being furnished with good communications right up to the Nepal boundary, and it interrupts a line of country inaccessible in the rains, which runs from Gorakhpur to Sitapur. These irregularities are probably due in some part to the different meanings attached to query 21 by different officers, as well as to differences in the condition of neighbouring districts. It is known, for instance, that a certain portion of the Bijnor district is quite cut off in the rains from all communications with either the rest of Bijnor or the Saháranpur district, though this has not been noticed by the collector.

As to the peculiar conditions of the different tracts which have been marked on the map as insufficiently connected with the rest of the provinces, it will be sufficient to quote the remarks of the district officer within whose district each is situated.

"*Lalitpur.*—The means of communication, as regards the interior of the district, are good. There is one metalled and bridged road running through it from north to south, and the trading towns, such as they are, are connected by good fair-weather roads. As regards communication with other districts, nothing could be worse. To the north the district is bounded by the River Betwa, an unbridged mountain stream. Across this there is a causeway at Jherrar by which all traffic passes from November till June, but, as soon as the river gets flooded, it is impassable at this point, and traffic then goes by an unmetalled road viâ Siras ghát, where there are boats. By the metalled road crossing the river at Jherrar, Jhánsi is 57 miles from Lalitpur town; by the Siras it is 63 miles, of which seven miles from Tálbáhat to Sirás are unmetalled, and in some parts unbridged. But even the Siras crossing is not at all times practicable, and all traffic is occasionally closed for a week or 10 days at a time by the flooding of the river. This flooding is not governed by local rains, but by the rains in Bhopal, so that it is impossible to be sure at any time in the rains whether the river is passable or not.

AP.I. QN. 21

NORTH-WESTERN PROVINCES AND OUDH.

Mr. Buck.

"To the south this road is metalled and bridged as far as Bhileau ghát on the boundary of this district, but beyond it as far as Saugor, 43 miles, the road exists in name only, and is utterly impassable for wheeled traffic after the first fall of rain, the soil being within a few miles of Saugor black cotton. I have before urged the expediency of metalling this road, for from the Saugor district comes our supply of wheat, barley, gram, &c.

"Should it not be considered expedient to metal this road, and the Central provinces Government is, I believe, not inclined to do the work, justly arguing that the Central provinces would get no benefit therefrom, I would suggest that a good road should be run to Bálábahat in this district, leaving the Jhánsi and Saugor metalled road some four miles north of Gonah, and continued in the Saugor district to Khemlasa and Khorei, the great grain and cattle markets. Were this done, Lalitpur would be safe, as far as supplies of food go, as long as the Saugor district were not attacked by famine. In 1869 I had to get grain for Jhánsi, at Colonel Lloyd's request, from the Saugor district during the rain, and it had to be brought up by camels, &c., and then with great difficulty, owing to the want of a good road.

"*Mirzapur.*—The portion of the Mirzapur district known as the Robertsganj tahsîl, containing an area of 2,632 square miles and a population of 173,540, is awkwardly situated for drawing its supplies from other sources in case of local failure of grain supply.

"Its boundary extends some 100 miles south of Mirzapur and Chunár, the nearest points on the line of railway.

"The traffic is carried on entirely by means of pack-bullocks.

"As a rule, it never imports grain for its own use, but brinjaras bring grain from Sarguja, Rattanpur, and the south, which is again re-exported northward.

"Grain is generally cheaper in Robertsganj than in other tahsîls, owing to the excessive cost of carriage by pack-bullocks.

"To endeavour to import food grain into this portion of the district in the event of great scarcity would be very difficult, and probably private enterprise would fail altogether.

"If assistance were given by Government, however, the difficulties could be overcome. The population is thin, being only 66 to the square mile; the inhabitants are entirely agricultural, of low caste, and very poor. To a large extent they support themselves upon the produce of the forest and jungles; and should the crops in the neighbouring districts of Surguja and Palamau prove good, supplies would come to them from that quarter.

"*Gorakhpur.*—There is such a tract in the north of this district.

"It lies north of the Mahárájganj tahsîl, under the tarâi, and is some 25 miles broad by 18 miles deep, containing an area of some 450 square miles.

"It is without road or any means of access save footpaths and the roughest cart tracks, and the Rohin river.

"Owing to the rising of the river and the absence of communications it might at some time be impossible for unassisted trade to throw enough grain into this part to feed a portion of the population, if food utterly failed.

"Such a fear was entertained in 1874, and advances were given by Government for grain to be stored there, but eventually the grain in the markets, or supplied by means of relief works, was found to be sufficient during that distress.

"This part of the district requires development, and one of my proposals was (in case of relief works on a large scale being required this year) to open a new road right through the centre of this tract from the Mahárájgang tahsîl viâ Chauk (a Government forest depôt, and Sakwi, a timber depôt on the Rohin) to Deoghát on the Nepaul frontier under the large Nepal forest of Hardi Girma. This road would be about 31 miles long, and would be of the greatest benefit to this portion of the district, besides developing the timber trade with Nepal.

"*Basti.*—The northern garganas must be inaccessible in bad weather to trading operations of any magnitude, suffering, like other sub-Himalyan tracts, from the want of bridges. All such tracts are much cut up by hill streams. Writing of tappa Galaur the Settlement Officer remarks, 'The villages are almost 'all cut off from each other and from those in the 'neighbourhood by streams or jhils, which are only 'fordable here and there.'

"Yet, as I have pointed out elsewhere, the timber from which every one of these streams might be cheaply and efficiently bridged grows close at hand in the Government forests. If, however, a district officer wishes to bridge a stream he has to draw out an estimate, in which every log of wood has to be charged (though procured from the Forest Department) at the rates levied by private firms. These sub-montane districts are the largest of all, yet, having much waste and jungle land included in their area, their local funds are very poor, considering the great extent of roadways which have to be kept up. Consequently, the estimate when made up is but too often found to be higher than what the local funds can afford. No one beyond the district limits seems to be able to appreciate that insistence on money payments in such cases leads to no actual gain to Government, while on the other hand all the indirect gain from public improvements is lost. Government is most anxious to improve trade with Nepal, to prevent famine by improving communications, to open out waste lands, and to prove itself generally a Government of progress; yet when it comes to the point of using one part of its property to improve another, red tapeism is allowed to step in, and with illusory figures to bar the way; the trees grow on to rot and die, while the rivers go on unbridged for ever. Our engineers, too, have an overweening partiality for masonry bridges in preference to those of wood, though in the parts I write of clay and lime are scarce. Sál wood will last at least 100 years, and with skill in design wooden bridges can be adapted to any stream, however rapid.

"District officers should be allowed to indent without payment on the Government forests for any timber required for the bridging of public roads, and, properly worked, such an order ought to give a great stimulus to the traffic in frontier districts.

"Otherwise Government forests ought to be charged with cesses according to their areas, in common with the other revenue-paying portions of the districts, and at the same rates as average revenue paid on cultivation.

"*Bahraich.*—There are tracts in the north of the district into which it would, at present, be extremely difficult in time of scarcity to throw grain. These are the parganas of Dharmanpur and Tulsipur, and the tarâi villages of parganas Bhinga and Ikauna, area in acres—malguzari 226,131 and forest 22,355, total 451,486; number of villages 171 and population 66,178. The roads are merely fair-weather (surface) ones, and rivers presenting more or less difficulties to crossing intervene. In these tracts rice is extensively cultivated, and when drought occurs the people are sometimes in serious straits.

"This was the case in 1873, when the trans-Rapti tract suffered severely.

"The proposed railway from Bahramghát to Bahraich and from the eastern districts to Bahraich will, if supplemented by improved feeder roads, much lessen the danger, and at the same time immensely increase the value and cultivation of these tracts. Moreover, if the trade with Nepal should increase, the expediency of extending the Bahramghát-Bahraich Railway to Nanpára might be considered.

"*Sitapur.*—There is a tract like the one described in the country between the Chauk (Sárda) and the Gogra, an area of about 400 square miles. To make

NORTH-WESTERN PROVINCES AND OUDH.

Mr. Buck.

the roads passable in the rains they would have to be raised and metalled, and numerous drain bridges made. The rivers Chauka, Ul, and Kewáni are too broad to be bridged.

"*Kumaun.*—There is one portion of the district which would be greatly assisted in times of scarcity by the existence of a cart road. It is that lying along the border of Garhwál, and comprises the parganas of Pálipacháun and Dánpur. . The same road would also materially assist the parts of Garhwál coterminous with the above parganas. This road would run from Rámnagar viâ Mohan up the valley of the Rámganga as far as Gunai, and by it grain could be conveyed to a spot very central for the people of both Kumaun and Garhwál; for if famine ever should occur in these hills the most critical time would be the hot months and the rains. During the cold season the people can go to the Bhábar and procure grain for themselves, but during the rest of the year the Bhábar is very unhealthy for all but persons acclimatised, and men from the higher hills would sooner die of starvation than go there. A cart road to Gunai would allow of grain being stored at a spot where all the people could go to purchase it without fear of sickness. It would not be a costly work, as a great part of the line would be up the valley of the Rámganga, where it could be cheaply made.

" *Garhwál.*—Garhwál wants two iron bridges, and until they are constructed the district is isolated from the plains during the rains and sometimes even in winter. These two bridges—one over the Nayar and the other over the Koh river—should be erected at once, for until they are a serious season of drought might cause immense loss of life to an isolated population; and as the road which crosses these two rivers is our sole postal line and trade route for the plains, it is necessary to enlarge on the necessity for immediate action.

"It would be quite impossible for unassisted trade until the rivers Nayer and Koh are bridged to throw enough to feed a quarter of the population of Garhwál for six months into this district. If scarcity appeared, and the Nayar and Koh rivers were in flood, no traffic could approach the points where food would be most needed. In an isolated district of about 5,500 square miles and a population of about 310,282 people, it is not easy to point out any particular area or portion of the population which would suffer most; I would say generally the parganas to the south of the Almora road, as they are most liable to drought and furthest away from the main lines of communication."

There is, then, but a very small area of these provinces which is so badly provided with communication as to be altogether cut off from the outside during any portion of the year. But if in this area is to be included every tract into which it would be difficult or impossible to throw enough grain to feed one-quarter of the population for six months, it would comprehend some other portions of the provinces which are at considerable distances from railway communication. When the distance to be traversed by road is short, and there is a sufficient store of grain to draw upon, it would seem that ordinary district carts could transport the amount required. The Bijnor district is some 30 miles from the Muzaffarnagar station on the Sind, Pánjab, and Delhi Railway, with which it is connected by two second-class roads. Muzaffarnagar is one of the chief grain marts in the provinces, and collected grain in large quantities from the Punjáb during the past scarcity. The population of the Bijnor district is, roughly speaking, 774,000, and at the rate of 18 ounces per head per diem, it would require about 17,750 tons of grain at least to feed one-quarter of this population for six months. This is equal to some 4,80,008 maunds. During the year ending 31st March 1878 (six months of which were identical with the period of the greatest distress in Rohilkhand) the amount of grain which crossed the Ganges from the Muzaffarnagar into the Bijnor district by the two chief ferries was over 1,200,000 maunds. Nearly all this must have travelled between 30 to 40 miles by cart before it reached the Bijnor district. It is believed that some 4,00,000 maunds at least of this merely passed through a portion of the Bijnor district on its way to the neighbouring district of Moradabad, and another large portion was also en route for the Tarái and hill districts. But the figures show that, given a railway to collect it, grain can be transported for a distance of at least 30 miles in almost any quantity required, provided that there is a good road for it to travel on, and that there is a sufficient number of carts available. The last condition will only exist on roads which are always lines of considerable traffic, such as the roads between the Doab and Rohilkhand are.

BENGAL.

BENGAL.

Mr. Toynl

Inaccessible Tracts.—It may be stated generally, that since communication with Orissa was opened by sea there is no part of Bengal into which enough food could not be thrown to meet any wants the occurrence of which is within the range of probability. Whether or not private trade could in all cases do what was needful without the assistance of Government, it is impossible to say. It would depend on such a vast number and variety of circumstances as could not possibly be predicated. Trade in Bengal has a tendency to confine itself to old and stereotyped routes, but when new routes are opened out it is not slow to take advantage of them. Its ramifications extend to all parts of the province, and there is no district which is not, in some way or another, already connected with the great trade routes described in the answer to questions 18, 19, and 20.

There is some central point in or near every district in Bengal to which private trade, unassisted, would in general be able to bring such food as was required, and the people who required it could safely be trusted to manage its internal distribution in all but very exceptional circumstances. A universal failure of the crops over the whole province would, of course, completely paralyse private trade; but such a contingency is not within the range of probability. It may be said that since the introduction of the Road Cess Act every district officer has it in his own power to remove any difficulties of transport that formerly existed. This cannot be done in a day, but it is being done gradually, and no special measures are called for at present to meet a future possibility.

AP.I. QN.21.

ENTRAL ROVINCES ND OUDH.

r. Nicholls.

CENTRAL PROVINCES.

The answer would depend almost entirely, first, on the distance from which supplies would have to be drawn, and, secondly, on the power of the people, as estimated by traders, to purchase supplies if brought into the distressed locality. I will leave out of the question at present the feudatory states. Looking first at the zemindari estates, and the chindwara jaghir estates, and the similar wild tracts of rajaborari and kalibhit in the Satpura hills, under Kurku Chiefs, it may be said that there are no traders who would be at all likely to engage to any appreciable extent in the importation of grain.

But, on the other hand, experience has shown us that the inhabitants of nearly all these tracts, what with their readiness to move to more fortunate localities and the resources which they possess in themselves and in their knowledge of the life-sustaining products of their forests, are practically independent of foreign importations, at least of large importations. And this holds good of nearly all the wild parts of the khalsa of Mandla, Balaghat, Bhandara, and Chanda.

For the rest of these four districts unassisted trade might be relied on, provided that the traders could procure grain at the nearest points on the railway, or in the west of Chhattisgarh, at such prices as would enable them to retail at home at rates which were not beyond the purchasing power of the people.

The districts of Nimar, Hoshangabad, Narsinghpur and Jubbulpore, Betul, Chhindwara, Seoni, Nagpur, and Wardha also are, in this respect, safe. I think Saugor and Damoh, even in the northern parts, would be safe, if the home population alone had to be considered. But these parts are liable to be called on to support the strain of feeding no inconsiderable portion of the population of many native states of Baghalkand and Brundelkand, together with probably some thousands of people from Lallutpur and Jhansi, or parts of Central India lying further west. Such a task would probably not be adequately provided for by the local traders.

I think such pressure could hardly be imagined as coming at the time of the year when stocks are lowest and the roads impassable, that is to say in the rainy season, because naturally the kharif crops would never come into the market before the close of the rains, and traders regulate their stocks and operations on this knowledge.

I have previously said that Sironcha, a sub-division of the Chanda district, on the Godavari, 130 miles below Chanda, is very isolated. Much of the population is self-reliant. There is some water communication. Its trade lies chiefly with the opposite districts in the Nizam's dominions, and unless these were severely stricken at the same time unassisted trade might be reckoned on to bring in the requisite food, but at what cost I am not prepared to estimate. I must also suppose that there are on the Nizam's side no artificial restrictions, no prohibition of exports, and no prohibitive transit duties. The area which could not be considered self-reliant in respect of its supplies of jungle produce would not exceed 300 square miles, with a population of few thousands. The difficulty lies in its isolation. On the north it is bordered by the vast wilderness of Bustar, the navigation of the Godavari is rendered difficult by the triple barriers across that river which cut it off from the rich Delta country and the sea coast; and on the north-west, up the Pranheta country, it is separated from any large tracts of cultivation by the forests of Ahiri. But on the opposite side of the Godavari the districts of his Highness the Nizam, lying north and north-west of Warangol, abound in great irrigation tanks, and are perhaps safer than any other part of the Deccan against famine from drought.

Coming next to Sambalpur, the question is whether, irrespective of existing stocks, unassisted trade could lay down enough food to support for six months one-quarter of the population of the khalsa. To this might perhaps be added the probable requirements of the Chanderpur zemindari, also of Phuljhar, and the feudatory states of Raigarh and Sarangarh. But we have already seen migration and resort to the forests pull the people of these states and zemindaris through a total loss of their staple crop.

Returning to the khalsa, with its 1,770 square miles and 90,756 inhabitants, it is required to lay down 8,500 tons of ricc. Until the failure of the bahal and berna rice lands is pretty sure, there cannot, I imagine, arise any necessity for importation by traders. The requirements would be 1,400 tons a month, to be brought at a time when the river is lowest. The total carrying power of the boats enumerated by Major Scott is 26,000 maunds, of which a third part could not be employed at the time of the year when wanted. It would be unsafe to calculate on more than one trip from Cuttack to Sambalpur and back in a month.

The district is land-locked and isolated.

Distances are—

Bilaspur - - - - -	144
Seorinarain - - -	105
Raipur - - - - -	170
Cuttack - - - -	150

At present these are the only practical routes by which grain could be obtained in any considerable quantities. It may be assumed that the same unfavourable season which necessitates import into Sambalpur will affect in an equally disastrous degree either Cuttack or Chhattisgarh or both.

But supposing that both Cuttack and Chhattisgarh could supply the requisite grain, it unfortunately happens that Sambalpur has not the requisite carts and cattle for the land carriage, or boats for the river traffic. River communication with Chhattisgarh at this time of the year would be practically impossible, and the quantity which could be brought up the river from Cuttack by the existing boats would be quite inadequate. Until, in the course of time, from the increase of ordinary traffic between Cuttack and Sambalpur, the number of boats is vastly increased, no great alteration can be expected. The land carriage of Chhattisgarh is now fully occupied in other directions to the westward; to the eastern coast through Kalahandi and Karriar, to Jubbulpore through Mandla, and to Mirzapur through Rewah, the available brinjaras are generally fully engaged.

Therefore, I conclude that, even if we assume the traders had the will to import and the money to purchase, they would not be able to import without Government aid (and probably not even with such aid) six months' provisions for a quarter part of the population, 90,750 people, month by month, on a sudden requisition or emergency.

As for remedies, perhaps the navigation of the Mahanadi might be somewhat improved; the roads towards Cuttack, towards Midnapur and Ranchi, might be improved. The road to Binka, 28 miles south of Sambalpur, on the river, to which point the navigation is more free, might be advantageously improved. The advent of the railway to the western portal of Chhattisgarh at Kaltianpur will set free much of the land carriage of Raipur and Bilaspur, and this, with the progressing improvement of the road from Jubbulpore through Mandla towards Bilaspur, will tend to decrease the employment of brinjara tandas in the carrying trade towards Jubbulpore and Mirzapur.

At present, and until the railway from Nagpur to Killianpur shall have been completed, Chhattisgarh will remain a land-locked country, an "Orissa without a sea-board."

Central Provinces.

Mr. Nicholls.

In Chhattisgarh proper the khalsa area is 11,086 square miles, with a population of 1,752,362.

It is required to bring into it, on a sudden emergency, 3,942,814 maunds or 146,030 tons of grain, or at the best 657,138 maunds or 24,340 tons, month by month. It could draw almost nothing from Bastar, little from the eastern coast, less from Korea and Sirgujan and Mirzapur on the north; it must depend on its imports from Jubbulpore, and from the valley of the Weinganga and the more distant railway at Nagpur. The Sambalpur district might perhaps be able to help, but this could not be assured. The available carriage seems to be quite inadequate, at any rate towards the east of the Raipur and nearly all the Bilaspur district. The remedy is in the opening of the railway to Kallianpur, and if this railway were connected with Jubbulpore it would be all the more effective. It will be unnecessary to give my detailed calculation on this subject.

BERAR.

Berar.

Mr. Dunlop.

Mr. Jones.

Mr. Dunlop.—In the greater portion of the Wun district, but more particularly in the south, owing to the want of roads it would be impossible in time of scarcity to throw enough grain to feed one-quarter of the population for six months. In dry weather it might be done with difficulty, but in the rains it would be impossible.

The only way to remedy this is by constructing good roads traversable at all seasons of the year. At present there are only 29 miles of finished road (and that has an unbridged river in the middle) in the 3,907 square miles of which this district consists. Whilst such a state of things continues the people can fairly complain that in the event of famine they are cut off from all chance of escape.

The population of the Wun district, according to the census of 1867, but allowing for subsequent territorial changes, is 323,762 persons.

Mr. Jones.—In speaking of the south of Wun as isolated, Mr. Dunlop has forgotten the Wurdah Valley State Railway, the terminus of which, Wurora, is within 12 miles of Wun itself. This, with a road now about to be constructed in the interior, will make Wun as safe as any other part of Berar.

BOMBAY.

Bombay.

Mr. Peile.

In most of the Bombay districts no difficulty is anticipated in throwing enough grain into any part of them to feed one-quarter of the people for six months by means of unassisted trade. At the same time, better communications would make the process much cheaper and easier, and lessen the danger of a break-down from failure of carriage or forage.

The exceptions are—

*In Kaladgi.**—The five talukas lying south of the Done nullah, viz. Badami, Bagalkot, Húngund, Mudibhehal, and Bagewadi. Grain going to them from the railway has to pass the Done nullah and the river Krishna (unbridged), and the roads are very bad. A railway would entirely remove the difficulty.

In Dharwar.—The northern black-soil talukas Rón, Naolgúnd, and Gadak. The difficulties to be overcome are—(1) the distance from the coast, Rón being 150 miles from Carwar; (2) there is no metalled road leading either from Hubli or Gadak northward to Naolgúnd or Rón. In heavy rain the tracks over the black-soil become impassable.

In Ratnagiri.—The Mandargah petta on the Savitri river, and the Salshi mahal of the Deogarh taluka, to which it is difficult to transport supplies in the monsoon only. They could be relieved by Government agency.

---

*Area, 3,199 square miles. Population, 524,458.

MADRAS.

Madras.

Board of Revenue.

The collectors of Bellary, Cuddapah, Kurnool, North Arcot, South Arcot, Chingleput, Tanjore, Trichinopoly, and Salam are distinctly of opinion that as regards their districts this question should be answered in the negative. The collector of Bellary, which was one of the districts that suffered most severely during the recent famine, writes as follows:—"The experience of 1877 has been amply sufficient "to prove in the clearest manner that there is no "part of this district into which it would be difficult "or impossible for unassisted trade to throw sufficient "food to feed one-quarter of the population "for six months. Much stress is laid on this answer, "as prior to 1876 this was not thought to be the "case."

The collector of Ganjam writes:—"There might "be a difficulty about sending grain into the Maliahs "or the wilder parts of Goomsur along the hills in "this district. But the population is so sparse there, "and they are so accustomed to eke out their food "by roots, leaves, &c., that I doubt famine ever "being very bad amongst them; and, except in the "case of the Maliah people, it would always be "simplest to make them come for their food. A "famine in the Maliahs, if possible (it is most im-"probable), could only be dealt with by making "depôts of food at the most accessible places above "ghauts, and directing the people to come for it "there."

The collector of Vizagapatam does not reply to the question, but the Board infer from his other replies that he would answer it in the negative.

In the Godavari there are certain jungle-tracts in which it might be difficult to throw in enough grain to feed one-quarter of the population for six months, and the collector very much doubts, if unassisted, trade would offer to attempt it.

Though the collector of the Kistna district considers that the answer to the question should be "no," he adds, "At the same time such a necessity may "arise, but for a much more limited period. At "the commencement of the period of famine in a "district like this, where road communication is "very imperfect, difficulty will always be felt for a "limited period, even amongst people who have "plenty of money. There is always a panic when "famine sets in, and the merchants in the large "market towns whence the country supplies are "drawn refuse to export supplies by cart through "fear of loots." The above extract is sufficient to show that the considerations which have induced the collector to qualify his answer are altogether outside the question of means of access.

Mr. Grose, the collector of Nellore, says:—"I do "not think there is any one tract in this district so "isolated as is described; but if all the western "tracts which are most remote from the sea had to "be supplied at once, I doubt if carts enough could

HAP.I. QN.21.

MADRAS.

Board of Revenue.

"be secured. It must be remembered, too, that "famine is usually accompanied by drought, so that "cattle have no pasture, and grain cannot be moved "freely in carts. During the last famine cart traffic "was almost suspended from December till the "cyclone in May."

The collector of Madura considers that all parts of the district are accessible to cart or wheeled traffic, but difficulty is experienced during the rains.

From the Coimbatore district the collector reports that the Collegal taluk, with a population of 90,830, is the only part of the district into which it would be difficult for unassisted trade to throw grain in time of scarcity; and, as distance and bad roads have to be overcome, and rivers have to be crossed, he proposes one good metalled road, bridged where necessary, from Erode to Cusbah Collegal. The Board have to observe that the collector has not been taken into consideration the roads in the Mysore plateau on which Collegal is situated.

The Commissioner of the Nilgiris anticipates difficulty in supplying the South-east Wynaad under certain circumstances; but he adds, "With the "numerous ghats total cessation of supplies and "consequent starvation could hardly result."

The collector of Tinnevelly does not think there is any village in the district into which there would be a difficulty of throwing in supplies in times of drought, although there are many that are very inaccessible during the monsoon.

The collector of Malabar is of opinion that there might be difficulty in throwing supplies into parts of the Wynaad, and into the Attapadi Valley, but considers that the difficulty is not likely to be insurmountable or even considerable.

The collector of Canara alludes to the closing of the ports and difficulty of moving grain in any part of the district during the heavy rains from June to September, and proposes a railway from Bangalore and a canal up the coast. The Board have no doubt that the country generally would be very much benefited by the proposed railway and canal, but they cannot look upon them as urgently called for for the purpose contemplated by this particular question. A famine in Canara is a contingency so remote that it would be wasteful to spend money in precautions against it; and even if one were to occur the out-turn of the crops is known early in the year, and as the people are in the habit of laying in their stocks before the monsoon commences, it is then, when the ports are open, and not during the heavy monsoon, that private trade would exert itself.

Speaking generally of the presidency, the Board would say that, assuming private trade to be active and energetic, and confining themselves to considerations of means of access alone, there is no portion of the presidency into which grain could not be thrown by unassisted private trade in times of local scarcity. Difficulties undoubtedly would arise, but only such as could speedily be removed by the agency of the Local Fund Boards, who are now charged with the administration of the communications of the country. The isolation which it would be really difficult to meet would be that arising under circumstances similar to those noticed by Mr. Grose, viz., the isolation of the more remote portions of large famine-stricken tracts to which grain had to be brought from long distances with the means of cart carriage paralysed by want of pasturage. Nothing can remedy this but the development of the railway system.

In sparsely populated hill tracts such as those alluded to by the collectors of the Godavery, Ganjam, and Vizagapatum districts, the inducements offered to private trade are not such as to make it likely that it could be relied on in times of scarcity, but Government grain could be thrown in to central depôts to which the hill people could come and fetch it.

CENTRAL INDIA.

Mr. Wingate.

CENTRAL INDIA.

Baghelkhand.—The Sohagpur tract is 150 miles from the nearest railway station. The Kaimur hills lie across the direct route, and there are no roads. But pack-bullocks are used, and, the population being sparse, difficulty would only be experienced during the rains. There may be better communication with the Chota Nagpur side.

HAP.I. QN.22.

CHAPTER I.—QUESTION 22.

To what extent has telegraph communication been established between the chief towns of your province? Having in view the value of rapid communication in time of distress, are there any important lines which it might be desirable to construct?

PUNJAB.

Major Wace.

PUNJAB.

The Punjab is in telegraphic communication with the rest of India by two lines; of which one leaves the province at Delhi, and the other at Mooltan. The former directly connects the Punjab with the North-Western Provinces and Calcutta; the latter with Sind and Bombay. In the interior of the province the telegraph system consists of three principal lines. The first follows the railway line from Delhi to Lahore and Jhelum, and then by the trunk road to Peshâwar. The second follows the railway line from Lahore to Mooltan and Sakkar, in Sind. The third, starting from Sakkar (Rohri), in Sind, connects all the frontier stations on the west bank of the Indus northward to Kohât, where it is again connected with the first line at Rawalpindi, adding in the branch lines, viz., the branch connections with Rewâri, Simla,

CHAP. I. QN. 22.

PUNJAB.

Major Wace.

Pattiála, Ferozepore, Dalhousie, Siálkot, Murrere, and Abbottabad; the total mileage of telegraph lines in the province is:—

	Miles.
(1.) Main line Delhi to Peshāwar	628
Branches—Delhi to Rewári (Rájputána State Railway)	51
Umballa to Pattiála	37
Do. Simla	79
Ludhiána to Ferozepore	77
Amritsar to Dalhousie	117
Wazírabad to Siálkot	25
Rawalpíndi to Murree	39·5
Kala-ke-Serai near Rawalpindi to Abbottabad	44
(2.) Main line, Lahore viâ Mooltan to Sakkar, in Sind	492·5
(3.) Main line, Sakkar to Kohât up the west bank of the Indus, and thence to Rawalpindi	404
Total miles	1,994

All this is permanent line. I have not reckoned a few purely temporary lines, now working mainly for military purposes.

By this system 23 out of 32 districts are in direct telegraphic communication both with Government and with the Commissioners of divisions. The nine districts lacking such communication are:—

(1.) Karnál, in the Delhi division, distant by metalled road 74 miles from Delhi and 47 miles from Umballa. The postal communication is by horsed carts and metalled road, which run in 13 hours from Delhi to Karnál, and in eight hours from Karnál to Umballa.

(2.) The three districts which compose the Hissar division, the head-quarters of each being connected with Delhi by a partly metalled road, and the distances from Delhi being:

Rohtak 45 miles, or by post - 7½ hours.
Hissar 104 „ „ - 19 „
Sirsa 53 „ „ - 30 „

The post is carried by horsed carts.

(3.) Hoshiárpur and Kángra, the head-quarters of the former being distant 24 miles; and that of the latter (at Dharmsála) 103 miles from the divisional head-quarters at Jullundur. The post is carried by foot runners on an unmetalled road.

(4.) Shahpur, of which the head-quarter is 99 miles distant from Jhelum, on the telegraph line between Rawalpindi and Lahore. The post is carried on an unmetalled road by foot runners, time 20 hours.

(5.) Muzaffargarh and Jhang, in the Mooltan division; of which the former is 16 miles distant from Mooltan, and the latter 60 miles from the Chichâwatni station, on the Mooltan and Lahore Railway. From Chichâwatni to Jhang the post is carried on an unmetalled road by horsed cart.

The Financial Commissioner is of opinion that there is no special urgency of the nature indicated in the question under reply for the completion of telegraphic communication with these nine districts. None of the distances are such as might not, if occasion required, be rapidly connected by temporary lines; and meantime the postal communications are reliable, and are never interrupted or delayed except by heavy rain or floods.

NORTH-WESTERN PROVINCES.

NORTH-WESTERN PROVINCES.

Captain Pitcher.

The East Indian Railway and the Oudh and Rohilkhand Railway, supplemented by the telegraphic offices at military stations like Sitapur, supply a fair number of telegraphic stations for the general events of the province, but for times of distress it is most desirable that every civil station should be in telegraphic communication with the rest of India.

The following stations have no telegraphic office:—Jhánsi, Lalitpur, Jalaun, Budaun, Mainpuri, Kheri, Bahraich, Gondah, Basti, Gorakhpur, Rae Bareli, Sultanpur, Partabgarh, Garhwal, and the Tarái. Hamírpur, Banda, Bijnor, and Azamgarh are probably also without them, but the officers of those districts have so far given no information.

BENGAL.

BENGAL.

Mr. Toynbe

The province is very well provided with telegraphic communication. In the province of Behar, including the two Commissionerships of Patna and Bhagalpur, and containing 12 districts, there is direct telegraphic communication with the head-quarters of all districts except Saran, Malda, and the Santhal pergunnahs. They are accessible from telegraph stations on the East Indian Railway. The telegraph to Gya is under construction.

In Orissa, out of three districts, only Purie is unprovided with a telegraph station, but it is only one night's post from Cuttack. A new line has lately been constructed to connect Cuttack with False Point. In Chota Nagpore, out of four districts, Hazaribagh is the only one provided with a telegraph station.

In the Chittagong division two districts out of three are in direct communication with Calcutta and each other. The exception is the Chittagong hill tracts.

In the Dacca division only two out of five districts have direct communication by telegraph. In the Faridpur district there is a telegraph station at Goalundo; only Backerganj and Mymensingh are entirely without telegraphic communication.

In the Rajshahai division Darjiling and Jalpaigori are in direct communication; the telegraph line on the Northern Bengal State Railway runs through all the other five districts, though they have not telegraph stations at their head-quarters.

In the Presidency division the only telegraph station is at Calcutta; Nadiya and Jessore can be reached from the Eastern Bengal Railway telegraph, and Murshidabad from the Azimganj Railway station.

Of the five districts of the Bardwan division three have telegraph stations; Bankura and Birbhum have not, but there is a telegraph station at Raniganj, a sub-division of the former, and Suri, the head-quarters station of the Birbhum district, is only 7 miles from the nearest telegraph station on the East Indian Railway.

Considering the existing postal facilities, and the fact that the districts hitherto most subject to famine are all already provided with telegraphic communica-

BENGAL.

Mr. Toynbee.

tion, except Saran, and that it is easily accessible from Arrah, it cannot be said that any additional telegraph lines are required in Bengal to meet the necessities of future famine administration. All the most important towns in the province are connected with each other and with Calcutta by telegraphic communication, and such lines as have any prospect at all of financial success have already been constructed. To sum up, 22 out of 43 districts in Bengal have telegraph stations at their head-quarters, 12 have lines of telegraph running through them, and more or less accessible to post or special messenger, while only nine are wholly unprovided with telegraphic communication, viz., Manbhum, Singbhum, Lohardagga, Puri, Maldah, Saran, Chittagong hill tracts, Backerganj, and Mymensingh. All these are within easy postal distance of the nearest telegraph station.

CENTRAL PROVINCES.

CENTRAL PROVINCES.

Mr. Nicholls.

The existing telegraph lines follow the open lines of railway. The military station and important trading town of Kamptee is connected with the railway lines at Nagpur, 10 miles distant. This line is continued through Seoni to Jubbulpore, having a total length of 174 miles. Saugor is distant 75 miles from Kareli on the G. I. P. R., and a telegraph line runs beside the military road, connecting these points. The fortress of Assirgarh is distant 6 miles from the telegraph. The military posts and commercial towns of Raipur, Sambalpur, Hoshangabad, and Chanda, besides Sironcha, are not connected, nor is Pachmarhi, a military post and the sanitarium and hot-weather residence of the Chief Commissioner and staff. Hoshangabad, a military post on the frontier of the provinces, the crossing place for much of the Bhopal produce over the Nerbudda, and the head-quarters of a Commissioner of division, is distant 10 miles from the railway and telegraph lines. But the new railway would take the telegraph to Kallianpur, 50 miles distant from Raipur, the head-quarters of the Commissioner of the Chhattisgarh division.

Assuming that the telegraph will follow the railway to Kallianpur, the portal of Chhattisgarh, probably commercial and military considerations, over and above the considerations here referred to, would necessitate an extension to Raipur. On general grounds, extensions to Pachmarhi, and perhaps to Chanda, are eminently desirable. A line to Pachmarhi has, I understand, been sanctioned.

BOMBAY.

BOMBAY.

Mr. Peile.

The existing lines are :—

(1.) From Bombay North, through Surat, Broach, Baroda, and Ahmedabad, to Deesa, and thence into Sind and through Rajputana into the North-west; (2) from Bombay East, through Thana, Nasick, branch to Dhulia for Khandesh, Bhosawul, and so to Jubbulpore and Nagpore; and south-east to Poona, and thence (*a*) to Sholapur and so to Hydrabad, Madras, and Bangalore, (*b*) by Satara, Kolhapur, Belgaum, Dharwar, and Hubli, to Bellary, and so to Madras and Bellary, with branches from Belgaum to Vingorla and Goa, and from Dharwar to Carwar and Coompta in Canara. Communication exists with Ahmednagar by a line between Dhond and Manmar. The principal towns left out by this system of lines are Ratnagiri and Kaladgi or Bijápur. Proposals by the collector of Ratnagiri to construct a telegraph line from Kolhapur to Ratnagiri, Chiplun, and Rajapur are under consideration. A line from Sholapur through Bijapur and Kaladgi to Dharwar is very necessary for rapid communication in a famine. The collector of Kaladgi says —"Telegrams generally arrive with their postal advices, sometimes a day or so later."

MADRAS.

MADRAS

Board of Revenue.

The Board have not much to say with reference to this question. With the exception of Chittoor, which is within 18 miles of a railway station, telegraphic communication exists between all district head-quarters and the presidency town, as well as along all the lines of railway; and as temporary lines can always be run up when desired, the Board do not consider that the desirability of having rapid communication in times of distress necessitates the establishment of permanent stations involving a financial loss. At present new stations are always established experimentally wherever there is any reason to believe that they will pay, and continued as a permanency if the result of the trial is satisfactory. If lines of rail are increased, telegraphs must necessarily accompany them.

CHAPTER I.—QUESTION 23.

Has there been within the historic period any sensible denudation of the forest in, or bordering on, your province? Can it be tested by statistics showing over how much area forest or scrub jungle has been cut down? Can you state any specific facts which lead you to think that such deforestation has caused injurious effects in any way, either in respect to the fall of rain or the abundance or permanence of water in streams, or wells, or the subsoil, or the denudation of the surface soil, so as to render it unfit for cultivation? And what injury has been produced, and to what extent? Can you adduce any direct evidence that such injury as you think has been caused by the clearing of the forest has been remedied by its reproduction? If you think the clearance has been injurious, what steps would you propose to take towards reboisement? Should it be done by artificial planting, or by conservation of the tract, so as to keep out cattle grazing and fires? Can such conservation be effected without interfering with any vested rights of the people, or with their consent, if interference is necessary? Which of the two methods would be easiest, cheapest, quickest of operation, and most effectual? To what extent, and on how large an area, could either method be followed?

PUNJAB.

PUNJAB.

Major Wace

The reply to this question is furnished by Mr. Baden Powell, C.S., Conservator of Forests in the Punjab. It is annexed in full. The Financial Commissioner desires me to remark thereon, that, in his opinion, the question whether there has been in the Punjab deforestation of the injurious nature described above must be answered in the negative or left in doubt; except as regards the lower hills of the Hoshiárpur district, where mischief to the adjacent lands below has no doubt occurred from the excessive denudation of the hills, caused by the increased population and manufactures of the district, and by public works on a scale of magnitude previously unknown in that part of the country.

Also, as regards the concluding paragraphs of the conservator's reply, the Financial Commissioner observes that, though in the abstract the Conservator's arguments are correct, the facts, as implied in head 2 of the argument, are likely to give a wrong impression. The conflict is not between vast public interests and the private interests of 10 or 12 cattle owners, but between public interests of a very limited description, which it is proposed to benefit by measures of forest conservancy of doubtful efficacy, and the harrying and discontenting of a whole country-side which those measures involve.

Mr. Baden Powel

There is only one general remark I have to make on the following answers. The questions set me are very properly directed to ascertain actual facts and results, and not to evoke theories. Forest facts and forest results can only be produced in a series of years; when, therefore, it is remembered that forest conservancy has only been in existence in the Punjab for about 12 years, the actual results can only be few, but it would be the grossest fallacy to allege that we have no sufficient ground to urge the importance of conservancy and reboisement works, because the conditions in which we are placed do not enable us to point to fully successful remedies.

Accomplished evils are only too common; their remedy has as yet only commenced.

We must rely on the known facts of science, on the experience of other countries, on analogy, and on influence from works as yet only beginning to show results. It may be urged that in such a case there is only a probability of success if measures are undertaken; that may be so, but at any rate there is a great deal more than a probability of mischief if they are neglected.

The 23rd question, chapter I., consists, in fact, of a series of questions; and it is only possible to exhibit answers to each paragraph separately:—

(*a*.) *Has there been within the historic period any sensible denudation of the forest in, or bordering on, your province? Can it be tested by statistics showing over how much area forest or scrub jungle has been cut down?*

In the present state of the country it is not likely that statistics will be available, though, if any useful purpose could be secured by it, with a great deal of labour a sort of estimate of the area of hill ranges more or less denuded might be made.

The facts (or otherwise) of denudation may be tested in the following ways:—

(1.) By the tradition of the country and evidence of old people who recollect a former state of things.

(2.) By a study of localities now denuded, and comparing them with similar localities which, from situation or other cause, have escaped denudation.

(3.) Supplemented as to (2) by the fact that there has been an enormous increase in the demand for wood both for fuel and for construction, which supply is known or certainly inferred to have been drawn from places now denuded.

I have no doubt whatever that throughout the Punjab the denudation of forests has been great and continuous. We have only since 1864 endeavoured to combat it, and that with very imperfect means, and in the face of an opposition which has been and is constant and unrelenting. This is always the case, especially in the beginning of any attempt to conserve, because the great bulk of a population (whether Indian or European) are sensible only to the pressure of immediate wants, and have no idea of individual restraint for the benefit of the whole, or of present restraint for the sake of a continuous supply for the future.

There is ample tradition to show that the outer Himalaya, the Salt Range, the Pubbi Range in Gujrat, the outer hills of the Sivalik,* and many other places were better wooded than they are now.

This tradition is amply confirmed by the fact that these localities bear all the signs of its truth; while we know that practices of burning and indiscriminate

IAP. I. QN. 23.

PUNJAB.

Mr. aden Powell.

grazing (practised increasingly with an increasing population) are adequate to produce the disastrous change.

Moreover, the constant wars which before our rule desolated the country cannot have been without effect on the forest. And the immense increase of the population, the demands for railways, for workshops, for cantonments, and for towns that now number thousands instead of tens of inhabitants, and are supplied with fuel and wood from somewhere, must necessarily tend to denude the country, unless measures for reproduction are adopted. These measures have been and are still wholly inadequate to replace the drain on the material.

Within my own time enormous areas in the plains have been cleared of fuel to supply the railways, not the least part of whose demand is for the burning of millions of bricks used in the first construction.

Mr. Coldstream, Deputy Commissioner of Hoshiarpur has proved that the same effect has taken place in the Siwaliks. The destruction (chiefly from similar causes) in the hills, notably in Hazara and Rawalpindi, has been great. The denudation has no doubt been greater in our own time than at any other, because population before was scantier; there were none of the present great centres of demand; and it needs no argument to establish that, the scantier the population and its cattle, the less are the obstacles to the natural reproduction of material taken from the forests.

(*b.*) *Can you state any specific facts which lead you to think that such deforestation has caused injurious effects in any way, either in respect to the fall of rain or the abundance or permanence of water in stores or wells or the subsoil, so as to render it unfit for cultivation?*

This subject must be approached apart from the known fact that such evil results are produced by forest denudation both in tropical and temperate climates; but it is impossible to exclude the absolute evidence of facts, the state of the Department des Hautes Alpes, the valley of Dévolny, and the region of Embrun, to say nothing of the numerous instances cited in various authors in which the effects of forest denudation are known and recorded. In tropical countries, so far from there being any feature which renders it possible that results would be otherwise, the increased violence and duration of our rainfall can only tend to intensify and make more alarming the results which follow.

Every part of our hill districts where there is any population (*i.e.*, out of the truly Alpine region) is more or less ravaged by torrents. Near Chumba (to take only one instance), and on the route from there up the Siúl valley, torrents after torrent may be noticed; dry in the summer, but in the rains coming down with fury, bearing down masses of stones and débris which spread out at last into a vast cone or fan shaped mass of débris; this, increasing in breadth year by year, destroys fields on either side. The same may be observed all over Hazara, valleys that might be fertile and cultivated being filled with stones as far as the eye can reach.

Some of the disasters are, of course, due to landslips and to peculiarities of geological structure, and to accidental closures of the course of a stream, where, after the water has accumulated for a time, the barrier is violently burst, and a destructive flood follows.

But making the fullest allowance for these cases, the number of instances that have come under my own observation certainly due to, or subsequently aggravated by, forest denudation (and even denudation of herbage and turf by burning and over-pasturing—a matter also of the highest importance) are very numerous.

A familiar instance may be quoted in the Tirth valley, or that part of country traversed by the road from Simla to Sultanpur, between say Menglaor and Lárgie.

The state of the "chos" or sand torrents of Hoshiarpur ought not to be entirely unnoticed as another instance. I have specially reported on these curious torrents. The extremely soft nature of the soil of the hills would always render it liable to some detrition, and the streams would always exhibit sandy beds; but their present extent and their constant increase in length and breadth is certainly due to denudation, the evidence of which is conclusive.

The torrents that intersect the Salt Range, and bring down masses of stone and sand, may also be alluded to. The torrents called "Uj," "Rawal," and "Leh," which cross the road between Murree and Rawalpindi, are also mainly if not entirely due to denudation And I have directed a further more minute inquiry into the "basins of origin," so as to get permission to enclose these as forest lands. The destruction caused by the torrents is only too well known. A recent exploration of the sources of the well-known Chakki torrent near Gujrat showed that the main branches contributing stones and waste material came from hills utterly denuded in Cashmir territory.

The Gaggar is another familiar torrent flowing from denuded hills. There are evidences in Bhawulpur (detailed in the introduction to the Government of India Forest Report, 1872–3) to show that permanent rice cultivation, not derived from the Sutlej, was once there practised; and there is little doubt that the Gaggar was once a steady flowing river carrying fertility far south.

We have of course no statistics to show the area of land rendered unculturable by these streams, whose principal effects are seen to-day in the demand they make on public funds for repairs of roads and bridges, &c.

A great many of them have been so long in action that we can only point to lands now covered with stones without our being able to recall a day when they were otherwise.

As regards that part of the question which relates to rainfall, I would briefly observe that, while experiments carried on in Europe show a probability (and a strong one) that forests may have an influence in actually increasing the rainfall, we are as yet (even in Europe) unable to speak confidently, and in India data are wanting. To suppose that forests can create a monsoon is unreasonable; to suppose that they can attract and help in the condensation of clouds is by no means opposed to a sound judgment. But the practical conclusion is, that while we are waiting for confirmation of the effects of forests in this direction, we are amply justified in taking action regarding forest conservancy and reboisement by the other facts which no one disputes, viz., those concerning the supply of water in streams and wells, the safety of the surface soil on the hills, the prevention of destruction of lands, river banks, and what they support, as well as of bridges and public works, all of which can to some extent be secured by taking care of the slopes from whence the water (which does so much mischief or so much good, as the case may be) first takes its start,

The effect of forests in breaking the force of the fall of rain, absorbing a large proportion of the water, and acting as a filter and as a sponge, both to cleanse and slowly discharge the surplus, are too well known to be remarked on; but in connection with this I should like to say that I believe (with Mr. Medlicott) that the production of "Reh," which we call "Kalar," so deleterious to culturable land, is in no slight measure connected with the interference with the general system of subsoil drainage which must result when the outer hill ranges of a country are denuded, and when the rain that falls abundantly on them every monsoon is not enabled to soak into the soil and to feed permanent springs and streams, but is allowed rapidly to run off the surface carrying stones and sand into various torrent beds which, rushing with great violence for a time (which might be calculated at a few hours out of the whole season), pass away and

CHAP.I. QN.2

PUNJAB.

Mr. Baden Powell.

leave nothing behind. In a word, the effect is to substitute a surface drainage, violent as well as useless in its action, for a deeper percolation of water, affecting gradually and permanently the subsoil.

I can do no more than allude to the numerous remains of old villages and wells, long deserted and dry, which are found in parts of the Punjab plains. No certain information can be given; while the desiccation may be due to the deprivation of subsoil moisture, there is also the probability that changes in the course of the great rivers, and their recession from the vicinity, may be a more immediate cause. As regards the area rendered unfit for cultivation, the area in Hazara alone of torrents beds amounts to something like 80,000 acres; but the area covered with sand in Hoshiarpur, and otherwise injured all over the country, cannot of course be stated in figures.

(*c.*) *Can you adduce any direct evidence that such injury as you think has been caused by the clearing of forests has been remedied by its reproduction?*

In a province where (beyond enacting a few tentative and general rules to save standing trees in certain places) little or nothing had been done previous to 1864, and whereas since then a small forest staff has been employed which had everything to learn, and to make its way slowly against every kind of difficulty both from within and from without, it is not possible that extensive results can as yet be quoted. We have as yet made one large artificial plantation, covering about 12 square miles, and no doubt this has produced locally an increased dewfall and some change in the local temperature. As to the effect of measures of natural conservancy, *i.e.*, giving protection (without artificial planting), all that I can say is, that the natural reproduction (when we have have been permitted to protect areas) has been such as conclusively to show the good effects of mere protection. A small but interesting experiment (not under the Forest Administration) may be seen at Rawal Pindi, where a piece of hard clayey soil with a few shrubs or bushes (of about 500 acres in extent) is now a public park full of verdure, and that solely by* the effects of careful protection for 15 years. And there are many individual tracts of forest, where-ever there have been constituted forests, all over the Punjab, which show the same results. While water in the streams may be found in many of these all the year round, similar watercourses in denuded places will be found dry.

Numerous instances may be met with in the hills of ravines closed up and cured by the spontaneous growth of bushes, &c. where from some accidental circumstance they have had the chance of growing up again.

(*d.*) *If you think the clearing has been injurious, what steps would you propose to take towards reboisement? Should it be done by artificial planting or by conservation of the tract.* * * * * *Which of the two methods would be easiest, cheapest, quickest of the operation, and most effectual?* [*I leave the omitted words regarding "vested rights" to a separate answer.*]

The difficulty, of course, is the magnitude of the work. But this should not cause despair. We cannot close the whole extent of vast ranges at once, or supply an enormous forest staff to supervise it. We must do the work gradually. We must attack successively, and slowly, one by one the points where the denudation has produced the worst effects. We must be content to take (in each forest division) a few only of the principal points, and assure ourselves of success. Prejudice may be removed best (as directed in the case of the vast work to be done in the Alps under the French law) by attacking places where the results will be seen at an early date. We should take, for instance, certain parts of the salt range, the sources of one or two definite and destructive torrents in Hoshiarpore, in Rawalpindi, and so forth, and be content to treat these. If we accomplish so much, and leave succeeding generations of officials to carry on the work, we shall have nevertheless done a great work, and saved thousands of rupees.

The first and most essential step is, having selected a definite boundary line along a range of hills selected for operation, or a definite "perimeter," that is, the area from which the ultimate branches and sources of a torrent take their rise, most carefully and completely to close and protect it, so as to give every possible chance to its natural restoration. All experience shows us that this (in a climate like that of India, where growth of vegetation, once allowed a fair chance, is rapid) is the most promising method of proceeding.

Whether we adopt artificial planting or rely on natural growth, this is the first thing (and an absolute sine-qua-non) to be done.

This leads me to the next point; there is no hard and fast rule to be laid down in any case, whether natural or artificial reproduction is to be adopted. The result of natural growth has to be watched. In most cases it will require:—

(1.) Closing and rest.

(2.) Certain mechanical aids known as "barrage," or series of rough dams made of rough stone (or what else may be available) built in a series one above the other, to aid the closing up of ravines; as fascines pegged or staked on to the soil; as rows of live stakes driven firmly into the ground, and made of willow, poplar, or other species that strike root readily, so that each stake becomes a tree; cutting of gently sloping gutter or drains to lead off the water, and prevent it concentrating its flow into a dangerous ravine, thus also dispersing moisture, and rendering the hillside soft and damp, so that sowings may be made or cuttings planted along the edges of such drains or channels.

(3.) Sowing, or filling by transplants, of beds silted up or other suitable places at the heads of streamlets and natural points of drainage collection.

Of course natural production is the cheapest, and, when aided as above, may be just as quick and effectual, if not more so, than purely artificial work; but most ordinarily both will be used in combination, and the precise form to be adopted must entirely depend on the physical conditions of the place dealt with.

(*e.*) *Can the conservation be effected without interfering with any vested rights of the people, or with their consent, if necessary?* [*These words occur in the middle of the last quoted question; but are conveniently separated.*]

As far as consent is concerned, experience can alone show. In the Alps it has been found that when Government commenced the works on areas which it took up compulsorily, as soon as people saw the success attained they began (especially the more rational communal councils, &c.) to do the work in their own neighbourhood themselves and the Government aided in such cases by money grants or grants of seeds and plants. The areas or "perimeters" necessary to be dealt with were declared by forest experts, and the work was carried on by the State or by the "reboisements—Facultatifs" alluded to.

In talking with people in Hoshiárpur I find that those whose lands were affected by the sand were eager that Government should take steps, but the

---

* Of course roads have now been made, and avenues, trees, &c. planted, but the bulk of the growth of *Acacia Modesta* which covers the slopes is entirely natural growth.

HAP.I. QN.23.
PUNJAB.
Mr.
aden Powell.

people in the hills who had cattle said it was very true that the case was bad, but that their cattle would die. I said, "You can feed your cattle on "fodder, and you can take your cattle elsewhere if "the worst comes to the worst, but we cannot make "the land safe or reproduce grass and wood (which "will ultimately, after a little space of self-denial, "benefit you) except by closing the hills."

The idea that any peasantry will ever consent at first to anything the benefit of which is future, while the pressure or discomfort is immediate, is contradicted by the experience of all forest countries. By rewards and by compensation you may reconcile people, and that is all. Government must judge what is right and fair to do, irrespective of popular clamour, and their orders must be carried out. The natural love of keeping things quiet, almost at any price, renders officials very unwilling to do this.

But next, as to amount of restraint necessary. The practical difficulty is that, the worse the denudation, the larger is the area over which cattle are spread, searching out the last blades of grass and the last sprouts of shrubs and plants for their scanty subsistence. Generally speaking, however, the locality is of so little use to the people that the actual hardship can be very little if they are deprived of the right to devastate it for a time. Liberality must be shown, and compensation paid where needed; and effort should be made, in all reboisement works, to grow quickly not only trees and shrubs, but above all grass, plants of fodder, and so forth, such as the medicago and other species, which after some months may be cut, of course without up-rooting, as fodder, and given gratis to people that have been excluded. But I beg to call attention to two prominent points the justice of which is undeniable, but which are apt to be overlooked.

1. However much A. and B. may have "vested rights" of grazing, they are not the proprietors of the soil.* Consequently they can never claim to exercise their rights to such an extent as to destroy the servient estate, or render it useless to the proprietor. All rights are inherently limitable to this extent. Hence the soil owner has the natural right to say: "The land is incapable in its present con"dition (without total destruction) of supporting "more than such and such a number of cattle. I "require that the cattle admitted should be limited "to that number which it will fairly support, and "I require that places which are in such a state "that they cannot support any cattle at all should "be closed, so that my property may be restored, "and not rendered alike useless to me and a source "of injury to others." Such a principle is admitted by every civilised law, and I could quote ample authorities (if for anything so obvious it were needed) alike from English, French, and German sources.

2. But if there is an absolute conflict between the private and the public interest, the private must give way. It is more reasonable that 10 or 12 cattle owners should be obliged to take their cattle away and grow fodder for them, and feed them in stalls, or even sell them, than that miles and miles of country shall be destroyed by the denudation of the "perimeter" or basin of origin of a hill stream.

The closure, it may be remembered, is only temporary; after a few years (may be under favourable circumstances four or five only, but of course no fixed estimate can be made) partial reopening may be allowed; care has then to be taken not to allow a greater number of cattle on to the site than can really be pastured there without risk of overgrazing for the future.

The existing forest law gives ample powers, in my opinion, for carrying out the procedure necessary, but nothing can be done without a firm grasp of the principles of forest conservancy, a clear understanding of what is fair and just, and a determination to work on these lines for the public benefit firmly and with a whole heart, not to be moved by a little clamour or an outcry which is sure to be raised if listened to, no matter how intrinsically just and wholesome the restrictions imposed are.

To the above report by the Conservator of Forests, I subjoin the following account of what has occurred in the Siwaliks of the Hoshiárpur district, written by the Deputy Commissioner, Mr. Coldstream:—

There has been within the last two generations a most extensive denudation* of forest area on the outer Siwalik, the chain which runs from northwest to south-east right through the whole district in the direction of its greatest length.

I cannot give complete statistics as to the area of denudation, but have been at some pains to ascertain generally its extent within each hill village.

The result is, that it appears that miles upon miles, I might say tens of miles, of hill side have been cleared more or less completely of their timber and brushwood.

Where formerly the nílgái, the tiger, and even the elephant were found, there is now no forest, not even in some places a scanty brushwood.

This deforestation has had the most disastrous effects,† for I think I may safely attribute to it, if not the existence, at least the increase, of the sandy beds called chohs, which seam the whole breadth of country from the water shed to the south-west boundary of the district. These are very numerous, occurring at almost every mile, and are sometimes themselves ½ a mile broad. These chohs are plains of arid barren land for most of the year; but for a few days each rainy season, and occasionally throughout the year, they are filled with wide rushing torrents sweeping everything before them, and carrying in a few short hours the whole drainage of the lower Siwaliks into the fertile plains of the Doab.

Loss of area in the hill villages from detrition, loss of potential forest income to the villagars, diluvion in the villages in the plains below, destruction of road, bridges, and railways, perpetual waste of sand in the midst of a moist fertile country, growing expenses of sand hills on neighbouring land, formed by the action of the winds, these are some of the evils which the chohs have caused or help to perpetrate, and which are probably intimately connected with the denudation of the forest on the outer Siwaliks.

I have ascertained that in Hoshiárpur parganah above 55 square miles (35,000 acres) are wastes of choh land.

During the period of Settlement 8,000 acres of assessed land alone have been diluviated or deteriorated by the action of chohs. To give an instance of which I know the particulars, the township of Dasuya has lost land worth Rs. 5,000 in two years from this cause.

In Jullundur district the complaints of the Hoshiárpur drainage appear to be yearly increasing, and the floods‡ from these hills have just caused enormous damage in the line of railway.

I believe that the people would generally consent to Government interference. The land is mostly the people's and not Government land; but I think they could easily be persuaded to submit to conservancy in their own interests.

Nature would soon reboise the tract, helped by sowings and plantings, which could be very cheaply done through the agency of the villagers.

---

* Of course, if the dangerous places are really private land, then, unless some special application of the Forest Act can be made, the land has to be expropriated; but here we are dealing with wastes which are in theory Government, as all waste is, but which is burdened with rights.

* Denudation of hill tracts of outer Siwalik range.

† Disastrous effects of denudation.

‡ Yes. But the floods did not go over the chohs, but along the courses of regular rivers, and the damage caused to the country and to the railway was owing to the railway embankment acting as a dam from its being deficient in water-way.—
GORE OUSELY, Financial Commissioner.

Mr. Baden Pow

I need not further enter into particulars, as the subject has been fully treated in my letters above quoted.

I consider the subject as one of vital and pressing importance, and I am only waiting for establishment for which I have applied, and a general sanction, to commence operations.

Addendum to the preceding Reply.

Major Wac

The Conservator of Forests has written a further reply (which is appended), under the impression that the Financial Commissioner's remarks, with which his previous reply is prefaced, will be understood as asserting that no deforestation has occurred in the Punjab. I am, therefore, directed to point out that the remark objected to was confined to "deforestation of the injurious nature described" in the question, that is to say, deforestation carried to such an extent as to affect the rainfall or water-supply in streams and in the subsoil, or to denude the soil and render it unfit for cultivation.

The letter now received from the Conservator shows, what the Financial Commissioner never denied, that a great deal of timber has been cut down in the forests of the Punjab and of Kashmir. It would have been impossible to build civil stations and cantonments, and to carry on the public works which the Government has undertaken, without a large consumption of wood both for building purposes and for fuel. And the increase of population, and the security obtained under the British rule for life and property, together with the fostering influences produced by limiting the Government land revenue demand, have caused an immense area of waste and forest land to be brought under cultivation. But the Conservator does not, even in his present letter, give figures showing that the deforestation caused by these circumstances has produced the injurious effects described in the question.

Mr. Baden Pow

I have received a copy of my answer to the 23rd question of the famine questions, chapter I. This answer is, I observe, directly disallowed by the brief remarks which precede it.

2. Were this merely an expression of opinion, I could not, of course, trouble you with any remarks. The answer to questions must necessarily evoke many differences, but my answer is denied in such a form that the Famine Commission must conclude that it need not be read, since it is entirely contradicted by the direction of the highest revenue authority.

3. And the point is one of great importance. For the only conclusion to be drawn is that there is no need for any measures of forest conservancy in the Punjab. But, in fact, I cannot help suspecting that there must be some mistake in the text as it stands. I read with astonishment (if the expression may be pardoned) the statement that, within historic times, no extensive clearing of forest has taken place in the Punjab. It is not, you observe, the question (in the first instance, at least) whether the clearance of forest has been beneficial or necessary, or excusable even, but whether it has occurred as a fact? Now the answer to this can only be that forest has disappeared from one end of the province to the other—not by hundreds but by thousands of acres,—and it would be hardly an exaggeration to say in some parts by hundreds of thousands of acres, and that except in the limited area under conservancy a great deal of what remains is steadily deteriorating.

4. I take the case of the hill ranges only. In Hazára, your own settlement report proves the enormous increase of population and extension of cultivation that has taken place, not merely in the plains but in the hills, where it may safely be estimated that 50 per cent. of the primeval forest has disappeared, while in many considerable hill ranges the whole of the forest has been cut down or reduced to mere scrub. In Rawalpindi, I have not the first settlement report to refer to and give the exact passage, but it is stated there by Col. Cracroft that the cultivation in Murree and Kahuta did not amount to anything more than a small per-centage of the whole. At present the demarcation of the remaining forest is so difficult that you will find that you can hardly obtain any continuous or fair-sized block of forest at all. It is a sanguine estimate now to hope that the forest may prove to be 15 per cent. of the whole!

In Kulu and the Kángra hills I need hardly remind you of the wholesale disappearance of forest consequent on the extension of agriculture and the spread of tea cultivation. All around Simla the same is true; the establishment of hill cantonments has everywhere carried with it heavy demands for land for increased potato and cereal crops, and large clearances for fuel and timber supplies, all of which have made great havoc in the forest, and little or no replacement of the forest thus destroyed has taken place. It is only quite of late years that forest conservancy has received attention. In proof of this I beg to call your attention to the Board of Administration letter to the Government of India, 1852, para. 8, &c. (*Barkley's Non-Regulation Law, page* 365).

The same is true in the Salt range as of all the outer and lower ranges of the Himalaya.

5. Then also consider the enormous quantity of deodar and pine timber that has been taken to the plains during the last 30 years for civil stations, public offices and buildings, railway bridges, and for sleepers and other objects. All this has been persistently extracted, without method or system and without any sort of control, from the hill forests overhanging our river valleys, the principle of the easiest work being alone looked to. The consequence has been, in Kashmir, that the deodar forests are fast disappearing, no measures of reproduction being taken. In the hills of Chumba and Basahir (like those of Kulu in our own territory) it is only the remnants of forest that were, some 12 years ago, leased by the British Government, and which we have commenced to replant and to conserve.

6. That a portion of this destruction was necessary is not disputed. Cultivation must advance, of course, but it has advanced without due control, and often in a very wrong direction. It is not only to be considered how much land is kept as forest, but how that forest is distributed and where placed.

Nor does this alter the fact that continuous and very extensive clearing of forest has gone on and is still in progress even within our own times.

7. I altogether put aside the indirect evidence afforded by the torrents like the Gaggar, the Hurro, the Soháu, the Bhimbar, Le, Uj, Rawul, &c. The hills from which every one of these or their feeders rise have certainly been denuded within "historic times," but I prefer to rely simply on the plain facts of the great increase of cultivation and the enormous supply of timber to the plains as utterly subversive of the opinion that it is doubtful whether forest has disappeared.

F.P.I.Qn. 23.

North-Western Provinces and Oudh.

Captain Pitcher.

NORTH-WESTERN PROVINCES AND OUDH.

Captain Pitcher.

Inquiries are here made :—

1*st.* As to the extent of forest denudation within the historic period.

2*nd.* Statistics of denudation are called for.

3*rd.* Specific facts in proof of injury caused by denudation are asked for.

4*th.* Extent of such injury.

5*th.* Proof, if any, that such injury has been remedied by reboisement.

6*th.* Or if injury still exists, what steps should be taken to repair it?

7*th.* By artificial plantation, or by keeping out fires and grazing and leaving the area to natural reproduction?

8*th.* Could grazing and fires be kept out without trespassing on the rights of the people, or would these latter object to trespass ?

9*th.* Which method seems most advisable on financial and practical grounds ?

10*th.* And to what extent can recommendations be carried out.

These queries touch on subjects of vast consequence to agriculture. Famine originates in a failure of agricultural operations. This inquiry is being held with a view to minimising that failure in the future; all, therefore, that touches the prosperity and promotion of agriculture is of the first importance.

Throughout question 23 runs an assumption that forest denudation and the conversion of scrub jungle into corn fields produces injury or inconvenience to agricultural interests. It does not appear to the framer conceivable that benefits may have been found to arise to populations from the clearance of forest or jungle. The replies, however, show that some officers think otherwise.

On all hands, from the forest officers of the North-Western Provinces and Oudh to the district officers of Lalitpur, Mainpuri, Etáwah, Moradabad, Muzaffarnagar, Aligarh, Kumaun, Garhwál, Fyzabad, Gonda, and the Tarái, extensive denudation, within the historic period, of forest and scrub jungle is admitted, but in no instance can statistics be given.

Nor (save with one or two exceptions) have any specific facts, as distinguished from thoughts, suppositions, and probabilities, been adduced as to any real injury resulting from such denudation.

The exceptions are the opinion of the Assistant Commissioner of Kumaun, that the rainfall of denuded tracts has decreased since such denudation took place, but on turning to his rainfall returns it may be seen that the rainfall of Haldwani, situated in a denuded tract of the Bhárbar, actually exceeds in some years that of Naini Tal and Almorah, though these stations are in close proximity to densely wooded hills.

And the Conservator of Forests, Oudh, talks of the southern exposure of the Gondáh hills being treeless, and covering the lower country with sand. The southern exposure referred to, when I saw it in 1876, was principally rock. However, as regards these same hills, I have seen plenty of timber in their valleys, and in my separate reply have referred to the excessive and wholesale denudation which is being carried on in those valleys by the Nepaulese.

Where the head of a river or stream is fenced about by forest, there can be little doubt but that the forest should be maintained, so far as it may be found necessary to maintain the stream.

Several district officers state positively that denudation has not been followed by any injurious effect, while those of Garhwál, Gonda, and Moradabad go further, and point out that denudation has been, from a sanitary point of view, beneficial. From the Tarái comes a proposition for further denudation, and it is notorious that cultivation in the Tarái only became possible when the jungle had been cleared to a considerable extent. The Commissioner of Kumaun, the Deputy Commissioner of Gondah, and the Deputy Commissioner of Lalitpur all intimate that they could spare part of their existing forests for cultivation, and the forest officer even of the Eastern Dún goes so far as to recommend further clearance with a view to rendering that part of the country more fit for man's habitation than it is at present.

The Conservator of Oudh admits the profit from a sanitary point of view of deforestation carried on outside of reasonable limits, those limits being the boundaries of his present forests.

The Deputy Commissioner of Kheri admits great evils from excess of forest and jungle, but considers that the benefits of forests outweigh the evils. He does not, however, supply the quantities of the equation.

As, then, denudation would appear to have taken place to a considerable extent without ascertained injury resulting in any instance, while ascertained benefit has resulted in more instances than one, it seems unnecessary to remark further on the remaining paragraphs of the question or to go into the merits of artificial or natural conservation, save to point out that the only district officers who venture opinions are distinctly averse to conservation when carried out at the expense of abrogating those privileges of grazing and rights of way which the dwellers in the neighbourhood of forests, and their forefathers for generations past, have hitherto enjoyed undisturbed. They seem to think that right of way, of common, and of pasturage, which the people of England are able to enforce even in the present day in a forest so little deserving of the name (compared to Indian forests) as that of Epping, should, if a just right, be conceded without demur.

The officer in charge of Tarái, and the Secretary to the Famine Committee, have, to a certain extent, travelled beyond the record in expressing their opinions that decentralisation of the Forest Department is a measure urgently needed, and that the best interests of the country would be served by trusting local Governments to manage the forests for themselves through the Revenue Department; but if these expressions of opinion will only lead to the suggestion receiving serious consideration, the new departure will not have been taken in vain.

The opinions of the forest officers submitted with reference to question 23 are, as a rule, merely repetitions of the axioms of the Forest Department, and, as the Conservator of Forests, North-west provinces himself remarks that "he fears the information will not be of much value," I may pass them without further remark, save to point out that the rainfall returns of Ránikhet for seven years, given by the Deputy Conservator in proof of the beneficial influence of conservation, exhibit characteristics of rise and fall similar to those of other districts in the North-Western provinces and Oudh for the same years.

The Deputy Commissioner of Jalaun, in replying to the query regarding past famines, states that no famine has been known since 1837–38, and under question 23 he states that there have been no forests in Jalaun "for centuries."

Regardless of cause and effect, he goes on to propose the perpetual alienation by Government of the land revenue on three acres in each estate on which zamindars are to be given takávi for raising forests. From other figures in the report this would amount to the abnegation by Government of some Rs. 60,000 a year. As the formation of forests is only interesting to the Famine Commission in view to the prevention of famine, a calamity from which

CHAP. I. QN.

NORTH-WESTERN PROVINCES AND OUDH.

Captain Pitcher.

Jalaun is already comparatively free, the proposition can scarcely be supported.

The Deputy Commissioner of Jhánsi rests in doubt as to whether the stony and barren condition of parts of his district (said formerly to grow sugar-cane, but date not given) has been brought about by forest denudation or by the destruction of ancient works for irrigation; on these doubts no opinion can be formed. This phenomenon of old sugar mills being found in places where sugar-cane has never been known to grow occurs elsewhere, and is perhaps due to the people setting up mills and expecting from the experience of one favourable year that sugar could be profitably cultivated ever after. It costs as much to move an old mill in some localities as to set up a new one.

Captain Campbell.

Naini Tal.—There have been large clearings in the Kumaun Bhábar; at present about 100,000 acres are cultivated there, the greater part of which was forest 30 years ago. In the hills very large clearings have been made, and many are going on still, I believe.

(3.) I think it is well known that deforestation must have an injurious effect on the pemanence of water in streams and springs. I have no means of knowing whether the actual fall of rain has been affected or not, but it seems probable, as the annual rainfall at Almora, where there is little forest near, is only about a third of that of Naini Tal and half of that of Ránikhet. I have repeatedly heard natives of these hills say that where formerly there was enough water to turn a mill there is difficulty now in getting water to drink. I cannot say much regarding the denudation of the surface soil, but with the heavy rainfall usual in these hills I feel sure that denudation must largely take place unless the ground is terraced as soon as the forest is cut down; but I believe such ground is first generally cultivated as "kil," and very gradually terraced.

Major de Montmorenc

Bahraich.—*Sub-answer* I.—*The Bahraich forests lie along the Nipal frontier. They have an area of 281 square miles.† Besides them, but not belonging to Government, are the Ikauna jungles, which run in a belt 20 miles long and three miles broad.

This tract has no timber of any value, but it affords capital grazing grounds and fuel supply for the villages around. I am not possessed of information as to "over how much area forest or scrub jungle has been cut down." But it is matter of notoriety that within a comparatively recent period large clearings of scrub jungle have been made. The Conservator of Forests will no doubt have been able to procure some statistics, as this is one of the few subjects in the long list of the Famine Commission questions on which he has to report.

III., IV., V.—I do not think that any deforestation that has yet taken place has caused harm in any way, or has lessened the rainfall in any degree injurious to agriculture in this district. Indeed, what clearings have yet been affected have operated to make the climate of Bahraich more salubrious.

VII., VIII.—These questions lie at the root of forest administration. There can be no doubt that either the rules of the forest system, or the manner in which they have been worked, or both, have pressed severely upon the villagers, who, under native rule, were allowed, or at any rate managed to enjoy, privileges which are now curtailed; and I am strongly of opinion (and I have an experience of six years and half of service in Tarái districts) that justice and expediency demand a relaxation of the rules, and more liberal concessions to the villages neighbouring the forests, especially in regard to grazing and the assignment of light timber for hutting. Some of the most cherished traditions of the Forest Department have been recently challenged in a startling manner by Captain Pitcher; and though I can hardly believe with him that periodical fires are not really injurious to forest conservancy, yet there seems much to be said on his side of the question. I incline to the belief that the outlying parts of the forest should be freed from some of the restrictions which now attach to them, but that the inner portions might be enclosed and worked with more strictness than has hitherto existed. The administration of the outlying parts ought to be controlled, if not wholly, at least in a great degree, by the Deputy Commissioner, who should have an additional assistant to aid him in place of the second forest officer, who I learn is to be appointed to this forest division.

Captain Wood.

Oudh.—The sál forests, usually occupying a high dry light sandy soil, not being so suited for cultivation of cereals as the low and damp forests chiefly occupied by dhák and miscellaneous soft wood trees, have suffered less than the miscellaneous forests. The sál forests have suffered more from ill-treatment and from graziers' fires, being more damaged than denuded. In Pilibhít and Puranpur there were extensive forests of sál now mostly degenerated into scrub.

The Bhira forests are now simply forests of poles in the Bhúr iláqua, on the right bank of the Soheli. Cultivation has cleared away a lot of miscellaneous forests, and also near Singhai (Khairagarh) a good deal of miscellaneous forest, huldu and dhák, has been cleared in the last 15 years. The next clearing is near Motipur, in the Bahraich division, between the sál forest and Chota Surju; the dhák trees still remain, uncut (for lac), but the miscellaneous forest has been cleared away.

I believe that the continuation of the Chukka and Chándi forests extended far south. In Bahraich and Gonda the forests remain just the same as formerly on the north of the Rapti, but there is no doubt that much forest, even sál forest, has been brought under the plough south of it. Here the mhowa (for flower and fruit) of the original forest is allowed to remain. The same has been done in Gorakhpur, and is still being carried on; the Government forests will soon be the only forests remaining. Colonel Sleeman mentions large jungles in districts, other than Kheri, Bahraich, and Gonda, the only districts in Oudh that I have forests in, not mentioning a few patches in Hardoi.

With regard to the border, I believe a good many mango groves have been cut for railway fuel along the line of the East India Railway, and that forests also in Mirzapur have been cut down.

I think the only damage has been done in the Bhábar forests, in Tulsipur (Bahraich and Gonda), P.I.Qn.23.

NORTH-WESTERN PROVINCES AND OUDH.

Captain Wood.

where lopping trees and thorns (for grazing) and overfelling in sál forest has allowed the vegetable mould to be washed away from the service soil. On the hills too, owing to the constant burning (the hills are in Nipal now) on the southern exposure, there is no tree growth to speak of, and the rains rush with violence over the country, covering the country near the nálas with sand.

This injury is confined to the country at the foot of the Bhábar; there is either too little or too much water.

The only thing that I can state is that Mr. Carnegy, who has been in the Bhira forest for many years, last year told me that he had noticed that the Kutna, which before used to be dry for long distances, except at the deep places where there were pools, has now a perennial stream, and the forests on the banks have been protected some five or six years; only partly protected, cutting prevented. I believe the water in the Jowra (Khairagarh) forest is becoming more regular in its flow.

The groves of Oudh are, I believe, increasing. What I consider would do good to the provinces of Oudh and the North-western provinces would be increasing the groves and plantations in those parts of the North-Western Provinces, Panjab, and Rajputana that lie to the north-west of the provinces—roughly speaking, the right bank of the Jumna—and also protecting any remains of scrub forest that remain, whether on the hills or plains, as these would act as a tattie; at present a good deal of the moisture from the trees in Oudh is probably carried on in the hot dry season to Bengal;—and the encouragement of tree plantation generally. I would advocate the keeping of as much grass lands as possible in the hands of Government, preventing the breaking of it up for cultivation, as these grass lands yield grazing when the cultivated fields will not yield karbi or bhusa, and it is in famine years that the grass lands have the greatest strain on them.

Mr. Ross.

Dehra Dún.—There can be no doubt but that the total prevention of fire would regulate the supply of water to the rivers very much. Now, by the continued burning, the hill sides are hard smooth surfaces, and the water simply rushes off. It does not even penetrate the soil, such as it is. If there were no burning, there would be a mass of roots and moss, which would increase year by year, and would form a soft spongy substance, which would retain the water for a long time. Thus excessive floods on the one hand would be to a certain extent prevented, and, on the other hand, a good supply of water would most certainly be kept up for a long time.

As somewhat bearing on this subject, I may mention what a difference it made in some rivers in Scotland allowing the water to run off freely. The feeding grounds of the river were hills used for sheep grazing, and were much too wet, rank moss and rushes growing in many places instead of heather or grass. This is, of course, very different to the Himalayas, but still the principle is much the same. The hills were intersected by main drains, open ones, cross drains, and drains of all sorts. The result was that, whereas before the drains were cut, when there was heavy rain in the hills, the rivers rose gradually and kept up for some days, and there was first-rate fishing. When the drains were cut, the water rushed down all at once, filled the rivers with filth, and ran down in two days, and there was no fishing. In the same manner, if the rush of water on the Himalayas is impeded by grass and roots and vegetation generally, the water supply of the river will be regulated much better.

But is it possible? In the first place, the tracts of Jaunsár Bawar, or all British territory put together, is but a very very small portion of the gathering ground of the Jumna and Ganges. Would it ever be possible to make the rulers of independent states stop burning? Secondly, how about sheep and cattle? There would be a loud cry of discontent; all the hill men would declare they were ruined, &c., &c. If burning were prevented in our hills and not in independent territory, the residents of our hills would certainly fly to the land not burned. There would be no great loss, but still Government does not of course wish to force them to any such action. For actual grazing, I myself do not think burning is absolutely necessary. It improves the grazing and it brings on the young grass earlier, but I think the sheep, &c. could get on well enough without it. In all the hills where there is heavy snow the old grass is laid, and it takes some time for the young grass to shoot up; but it does shoot up eventually all right, and is really better grass than the grass on the burnt ground. Burnt ground would be ready for grazing fully a month earlier than unburnt ground. This month's delay would of course be great at the worst time of year (in April and May); still I am quite convinced that, by keeping their herds low down, and at that time of year they usually do so, the people would get on well enough. The people themselves, one and all, say they could not possibly, and that all their sheep, &c. would die. I don't think so.

There is, however, one more difficulty; and that is, that insect life increases very much more rapidly in unburnt than in burnt land. The people say that, if the grass were not burnt, their sheep would get so full of vermin they would die. They say the vermin, tick, &c. would fill up their ears and render their life so miserable that they would die. There is something in this, but how much exaggerated I cannot say. Of course, if they could afford to tar their sheep or rub them occasionally with deodar oil, it would keep off all ticks, &c. The Forest Department has heaps of chips, roots, slabs, &c., &c., which would make enough deodar oil for the whole country. If depôts of oil were kept, and the oil given out free of cost or at a very slight cost, the insect difficulty would be got over.

5. The Jaunsáris do graze a great deal in unburnt lands in Jaunsár Bawar. They say they only graze in high-lying unburnt land, and that the cold there keeps down vermin; they say if the low valleys and khads were not burnt, that the sheep could not go into them. I do not think there are any villages that graze entirely on unburnt land.

6. Some people argue that, because burning is necessary in Scotland, therefore it must be necessary here. This is nonsense. Grass land is not burnt in Scotland, except by accident or now and then because the proprietor has a fancy that way. The land that is burnt is heather land. If it were not burnt, young shoots would not be thrown out; all the strength would go into hard useless wood. This is not the case with grass, which grows up afresh from the root each year.

7. The conclusion I come to is—

(*a.*) That unless you can prevent burning on the great mass of the gathering grounds of the big rivers, there would be very little use doing anything.

(*b.*) That it is quite possible for sheep and cattle to live and thrive on unburnt lands, so far as food is concerned.

(*c.*) That I am not in a position to say how far vermin might increase and might harm sheep, &c. in unburnt lands, but I am sure that if deodar oil were given free to grazers no harm would accrue from vermin.

BENGAL.

BENGAL.

Mr. Toynbee.

No statistics are available to show the area of forest or scrub jungle which has been cut down. The pressure of the population on the soil has, by gradually extending the margin of cultivation, caused the destruction of nearly all scrub jungle in most parts of Bengal, and it is not generally met with now except in the hilly and thickly populated border tracts of Orissa, Chota Nagpore, and Chittagong. There can be no doubt that in former times a very much larger area was under forest in British territory as well as in the adjoining Nepal territory than at the present time. From what we know of the latter, clearing of jungle has been carried on steadily of late, partly for extension of cultivation and partly for the export of timber to British territory. In Behar there are unmistakable signs that extensive jungles existed in former times, while, in the present day, only remnants of these are met with along the edge of Behar, as, for instance, on the Kymore hills in the southern part of Shahabad, along the southern boundary of the Gya district, in the Sonthal pergunnahs, and probably also in North Behar along the Nepal frontier. In the Behar plain itself almost all forest and jungle has now disappeared, forest growth having been reduced to mango groves scattered over the country. And even the latter seem to have been indented upon more heavily of late than in former times, owing to the demand for opium and indigo boxes.

The effects of forests on the water-supply are two-fold:—

(1.)—They reduce the temperature of a country, and consequently increase the probability of the vapour suspended in the air coming down as rain or fog; and,

(2.)—They regulate the supply of water.

In a denuded country the rain water runs off at once, and collects in the streams within a short time, causing them to rise rapidly, and is carried away to the sea. Land covered with forest, on the other hand, retains a large portion of the rain water at the outset, and gives it up again by degrees, thus causing a steady flow in the rivers instead of a sudden rush of short duration. The effect of forest growth mentioned under the first head tends to increase the rainfall; that mentioned under the second supplies a regular flow of water for irrigation and other purposes, besides preventing deterioration of the soil, consequent on sudden floods. This being the case, denudation, which doubtlessly has taken place in Behar by slow degrees, must have affected the rainfall and water-supply. The question then arises, what steps should or can be taken to remedy the evil effects? In answering this question great difficulties present themselves. In the first instance, the Government of India cannot prevent deforestation in Nepal; secondly, Behar is for the greater part a densely populated country, in which Government does not possess any lands worth speaking of. It may, however, be possible to counteract the evil effects to some extent in the following manner:—

(1.)—By causing a fair proportion of the area along the northern and southern edge of Behar to be kept under forest.

In the southern part of the Sasseram district Government has reserved an area of about 30 square miles, but it is believed that it might be possible to increase it to at least 100 square miles. To make up this area the hilly parts of the country, the Kymore range, which are of very little or no value for cultivation, should be selected. Similar steps might, perhaps, be taken along the southern hilly edge of the Gya district.

The northern edge of Behar, along the Nepal frontier, is only sparsely populated, and it would not probably be very difficult to obtain certain blocks for forest purposes, or cause them to be kept for such.

(2.)—The planting of mango and other groves throughout the province should be encouraged, and their destruction discouraged.

Wherever such is practicable the planting of trees should be enforced, and where the Government cannot interfere in this direction the planting might be encouraged by district officers. For this purpose nurseries might be laid out at the head-quarters of district officers and their subordinates, from which seedlings should be distributed. A good deal could be done in this direction if proper energy were brought to bear upon the subject. As regards discouraging the destruction of mango groves the Government may do a good deal. First of all, the use of mango boxes for the packing of opium should be stopped. Considerably over 100,000 cubic feet of timber are now used annually for this purpose at Patna, for which, of course, the finest mango trees are cut down. There will not be any difficulty in obtaining the necessary timber from the Oudh forests until the forests on the Kymore range and in Palamow are capable of yielding the supply.

The Government could further do a great deal of good by preventing local trees being cut down for fuel for brick burning wherever large public works, for instance, railways, are constructed. A good deal of damage may be done in this way. Whenever coal can be produced at a reasonable price engineers should be prevented from using local fuel for the sake of a paltry saving. The great mass of the people of Behar use cowdung to a large extent for their own domestic fires, but when they can obtain a few pice by the sale of firewood they do not hesitate to sacrifice their trees. It would be a grand thing for the welfare of the people if they could, by degrees, however slow, be brought to use manure for the improvement of their fields instead of burning it. One of the great obstacles in this direction is, of course, the scarcity of fuel in many parts of the country, and consequently every tree planted would help towards the object in view.

CENTRAL PROVINCES.

CENTRAL PROVINCES.

Captain Doveton.

Since 1860 any denudation that may have taken place in some part of the provinces is believed to have been almost counterbalanced by improvement resulting from conservation in others. At any rate, the change in this respect has not been anywhere sufficient to cause any appreciable effect on climatic conditions.

If the forests themselves be appealed to, there is every reason to believe that within the past 150 years the forests of these provinces have much deteriorated, and that the forest cover has been considerably reduced. I refer especially to the portion of the provinces lying north of the Nagpur extension of the Great Indian Peninsular Railway, and bounded on the east by Rewa state, the Mandla district, and the River Waingaga. Within this area trees are here and there to be found that could scarcely have acquired the form they have, had the conditions of forest growth not once been more favourable. Here and there also remnants of bambú forest are to be found. The presence of bambú in these cases indicates the existence at some time of a richer soil than is now to be found, and the existence of better soil in such

HAP. I. QN. 23.

CENTRAL PROVINCES.

Captain Doveton.

localities (the slopes of hills) indicates the pre-existence of a better class of forest. That there has been a vast diminution in the area under bambú (in itself a most perfect cover to the soil) I am firmly convinced; and I am inclined to attribute it to the pre-removal of the cover of trees. The bambú impoverishes the surface soil and gives a dense cover during the growing season, and on the trap hills young plants of this species must be so weak as to render the escape from forest fire or even a severe hot season extremely improbable. Thus it would appear that reproduction is chiefly from general seedings when the entire old crop dies off, and if at this time there is no tree-vegetation to shelter the young plants after cessation of the first monsoon there is little chance of any surviving. This opinion is not mere conjecture, but is the result of carefully observing the conditions under which reproduction has taken place on more favourable soils. Considering that the forest tracts of these provinces vary from rich forest to scrub jungle, any statistics regarding areas under wood could furnish no possible idea of the cover on the land, and would therefore, even if available, be useless.

Its Effect.—On this point it can only be stated that the existence of sál round Kiowli in Bijiragogarh seems to point to a time when there was a heavier rainfall than at present—while in the Wardha hills there are one or two old village sites, the names of which I cannot at present recall, the desertion of which is probably due to failure of the water-supply.

The rainfall registered at Kitowli during a comparatively heavy monsoon, that of 1874, was 52 inches; but this is the only record of rainfall at this place. Though I mention these two circumstances, I am by no means prepared to assign the supposed decrease in rainfall or diminution in water-supply to forest denudation, though they may possibly result from it.

Forest conservancy is of too short standing to admit of evidence being produced on this point, but that thoroughly well-stocked and protected forest must gradually tend to improve the water-supply in the vicinity of such forests is a point that does not admit of doubt.

The present rainfall and water-supply in the provinces is good, and for the maintenance of this supply the gradual but steady extension of forest conservation now in progress appears to be all that is required. Government has at its disposal a large forest area within which conservation can be effected without interfering with the rights of individuals. In some cases the acquisition of land for this purpose may be found necessary.

Extraordinary expenditure on restocking artificially does not appear called for except where there is a prospect of such undertakings proving directly remunerative.

BERAR.

Mr. Ballantyne.

BERAR.

"There are no certain facts within my knowledge as to the decidedly injurious effects of denudation. A register of the rainfall has only been kept for recent years since conservancy has been commenced, that is, since 1866; the data for times anterior are wanting, hence it is impossible to speak with any assurance. Our registers, as far as they have gone, show, however, that the reserved area gets a larger rainfall than the tracts without the forest, *e.g.*, for the current monsoon* the fall at Chikalda (outside our forest reserve) has been 54 inches 19 cents, and within the reserve the fall has been 65 inches 52 cents, taking the average of the registrations at Malka, Pili, and Raipur, points situated at a distance from each other, but all within the reserve. Whether this greater fall is entirely due to the presence of the jungle and conservancy, it would perhaps be rash at the present time positively to assert, but probably conservation has had something to say to it.

"I may also note that within the forest reserved area nullahs that, when I first came, used in the hot season to be waterless, now retain water more or less, here and there throughout the year, pointing to a greater retention by the subsoil of rain water than was formerly the case. Again, the streams within do not certainly seemingly flood so readily as before, and the discolouration of the water now takes place at a much later date than formerly. These remarks refer to a tract about 400 square miles in the Melghat, —the Bairagarh state reserve—where fires have for eight years been excluded, and where consequently not only has natural reproduction advanced with great rapidity, but the surface soil has annually improved from the accumulation of leaf mould and decayed grass, the roots of the grass and spread of the young trees tending to check denudation of the surface soil, and aiding the retention of water in the subsoil, and those other effects noted above."

---

* 1st June to 31st August 1878.

BOMBAY.

Mr. Shuttleworth.

BOMBAY.

Northern Division.—The northern forest division of this presidency extends from the Kolhápur and Sáwantwari states on the south to Rajputána north. It includes the following districts:—

1. Satara.
2. Ratnagiri.
3. Colaba.
4. Thana.
5. Poona.
6. Sholapur.
7. Ahmednagar.
8. Khandesh.
9. The Dangs.
10. Nasick.
11. Surat.
12. Broach.
13. Kaira.
14. Panch Mahals.
15. Ahmedabad.

And the replies here given are made upon direct personal knowledge of these districts.

1. There has most certainly been within the historic period a very sensible denudation of the forest in most of the above districts.

Not very many years ago the crest of the western ghauts in the Deccan, known as the Ghát Matha, throughout its entire stretch was richly clothed with evergreen forest; "the Dhangs," or groves of primeval trees, still existing in places along the Ghát Matha, testify incontestably to this fact. These dhangs have escaped destruction owing to superstitious fears attaching to them. They were and are still considered by the ignorant peasantry, as well as by the better educated classes of the native population, to be tenanted by spirits to whom the trees are sacred, and the belief exists that if the trees are injured evil will befall, not only the person, but also the connections and property of the person, who commits the injury.

The cross ranges of mountains and hills abutting from the gháts, eastward through the Deccan, were also within the recollection of man mostly covered with forest vegetation, the remains of which are to be seen in the shape of temple, woods, and groves; as, for instance, at the head of a ravine below the celebrated temple of Mahadeo, at Shinganapur, in the Malsiras taluka of Sholapur, there is a very small primeval wood. At Mandardeo, in the Satara district, on the cross range constituting the watershed between the Krishna and Nira rivers, is a virgin grove occupying a small knoll, while all around is bare and denuded. Many more of these groves could be instanced; their vegetation shows that nature and not man was their creator, and every one of the principal cross ranges in the Deccan could thus produce testimony to prove that their present condition is the result of man's senseless, improvident destruction of the beautiful vegetation with which a far-seeing Providence clothed them for the benefit of the world and all that live therein.

The few existing trees which linger here and there on some of the hills in the far east of the Deccan likewise indicate that in former years, and not so very long ago, natural forests containing the species they belong to covered the hills. On the hill range forming the northern boundary of the Barsi taluka of Sholapur the remains of a mixed forest are to be traced. Blackwood, teak, and its associates are to be found, few in number, distorted and deformed, so as to be almost beyond recognition.

The country round Igatpuri, also in the Nasik collectorate, was a dense impenetrable forest, until the iron horse came and cut a path through the jungle, and consumed the wood to maintain its vitality. The introduction of the railway through the Nasik and Khandesh districts has done much to denude the hills of their natural clothing.

In the Konkan the destruction of forests has been very pronounced: many of the hills in Ratnagiri and Colábá have been stripped within the conservator's personal recollection; where a few years ago a dense cover of trees existed, lending beauty to the picturesque, and performing the bountiful offices of nature, now a Sahárá of desolation appears.

Guzerat likewise has kept pace with the other parts of Western India in the progress of forest denudation. Possibly the work commenced earlier here than in the Konkan and in parts of the Deccan. But in the Mándvi taluka of Surat, in the Dangs, and in the Panch Máháls, forests and trees have perceptibly vanished.

II. It is very difficult, if not impossible, to test by reliable statistics how much area of forest or scrub jungle has been cut down. But there is indisputable evidence to show that the destruction has not been confined to a limited area, but has progressed far and wide.

III. It is very easy to state specific facts which support the belief that such deforestation has caused injurious effects.

In respect to the

(*a*) *Rainfall*, its capriciousness in the Deccan, and in parts of the presidency not immediately bordering upon the sea, is undoubtedly due to the destruction of woods and forests; possibly there may be no very marked difference in the total amount of annual rainfall between what it now is and what it was several years ago; there is, however, an appreciable difference which the records of the rain gauge may not do much to enlighten us upon. The presence of trees in the country secures a permanency of humidity in the atmosphere throughout the rains; there is less evaporation during "breaks" in the rains; a stratum of saturated air hovers over the land, and a constant precipitation of moisture, not in heavy downpours, but in frequently recurring light showers, such as are termed "Scotch mists," takes place.

That the destruction of forests has destroyed these conditions, *i.e.*, has injuriously affected the rainfall or precipitation of moisture, is evidenced by the fact that in the Deccan above ghats, the eastern limit of rice cultivation, which can only obtain in the rains, has moved westward; fields that used to grow rice some years ago when the country was better wooded, are in the present day incapable of doing so.

CHAP. I. QN. 23.

BOMBAY.

Mr. Shuttleworth.

In the Konkan, too, it is acknowledged by many cultivators that the "breaks" in the rains are of longer continuance, and the evaporating power of the sun of greater force, than it used to be when the country was well wooded; and that this operates injuriously upon the out-turn of their rice fields.

In respect to the abundance or permanence of water—

(*b*) *In Streams.*—We have had many proofs that the destruction of forests upon hill slopes has caused destructive floods. In Khandesh, in 1872, one of these floods occurred in the Panzra and Girna rivers, which have their sources on the western ghats of Pimpalner and Baglan. The inability of the denuded catchment grounds, more especially at the head waters of these rivers, to retain the rain that fell upon them during a few short hours of a dark night caused a sudden flood to come down both these rivers; the bridge over the Girna at Malegaon was swept away; Dhulia was partially submerged; villages on the banks of both rivers were destroyed, human life, cattle, and household property were involved in the destruction that took place. Other rivers in the district, the Tapti, for instance, whose catchment area is better protected, were not similarly affected.

A few days ago a wave of storm water came rolling down the Nira river, and capsised the ferry boat and drowned some of the passengers. Had the hills and slopes, draining into the river, been clothed with vegetation, this volume of water would never have returned to the ocean, and the flood would have been more temperate and of less velocity.

The denudation of hills undoubtedly affects the permanency of water in rivers. There are many rivers in the Konkan, Deccan, and Guzerat which formerly held water all the year round, but now run dry soon after the rains.

On the ghat line, where forest protection has been accomplished, streams of water may be seen all the year round. On the Satara ghats, especially, many examples of this present themselves; where the hill tops and slopes are preserved by vegetation, there clear limpid streams flowing out of the mountain sides occur, and a few hundred yards off, where fire and the axe have destroyed nature's covering, the dry beds of mountain torrents offer a striking contrast.

Numerous instances, too, are to be found of the return of perennial water to the dried-up channels following the re-clothing of the hills with verdure.

The Ratnagiri collectorate is a case in point. Since the hills of that district have been denuded of vegetation the soil has been swept off their surface into the rivers and navigable creeks. Where the ocean tide has opposed the current of the stream there the soil has been deposited, bars and banks have thus been formed, and the depth of water has decreased so as to impede navigation and stop traffic.

(*c.*) *In Wells.*—All over the Deccan, in almost every village wells may be seen that have run dry, not through any silting up or decrease of depth, but owing either to the water contained in the soil having sunk to lower levels, or to the decrease in storage; more of the rain water runs off the ground than it used to when vegetation checked its flow.

There are several instances where water has returned to dried-up wells when the higher levels draining on to the wells have been re-covered with vegetation. In the Poona and Satara ghats wells can be pointed out in which this has occurred. Take the village of Málegaon Budruk in Máwal as an example.

That the deforestation of the country has rendered fields that were once highly cultivated now unarable is not difficult of proof. Constant complaints are made in the Konkan that the unregulated flow of water off denuded hills washes away the embankments of rice fields, sweeps crops away, smothers them under soil brought off the hills, scores the fields with gullies and watercourses, carries its soil

CHAP.I. QN. 23.

BOMBAY.

Mr. Shuttleworth.

off, and converts it into a barren waste. Cultivators numerously petition every year for the remission of their assessment on this account.

In the Deccan, too, survey numbers may be seen in many of the villages, especially near hills, which a few years ago were productive fields, now deprived of their soil, scored all over with deep channels for short-lived floods to race down, are waste, uncultivated, paying no rent to Government, and doing nothing towards the support of man.

The destruction of trees on flat lands, too, has rendered fertile fields unarable; the absence of dew and of subsoil enrichment, added to increased evaporation, no leafy protection interposing between the direct rays of the sun and the surface soil, has completely exhausted the land; huge cracks and fissures are to be seen all over the fields, and the absence of the chemical constituents of fertility prevent it from bringing forth its due increase; the fields, having thus become utterly impoverished, can no longer be cultivated with profit.

When the plains of the Deccan and Kandesh grew trees, then the fields were necessarily more fertile than they are now. The trees furnished the materials for the formation of that vegetable mould from which crops derive their nourishment; everything that fell off the trees became natural manure; by their roots the trees not only opened the pores of the soil, but drew up moisture from the bowels of the earth, which they distilled through their leaves, to water crops, to cool the air and to benefit cultivation. They shaded the ground at certain times of the day from the evaporating power of the sun.

There are numberless proofs in the northern districts of the destruction of reservoirs and the injury to cultivation following the eradication of trees.

In the Poona collectorate there are two large reservoirs, one at Warki, some 12 miles south, the other at Pâtas, 35 miles east of the city of Poona, built of masonry and well constructed. These reservoirs once stored large quantities of water, and now one is completely silted up, and the other is fast arriving at the same condition, and a forest growth has usurped the place of water. The cause of this is not difficult to discover; denudation of the catchment ground has sent avalanches of soil to fill up the excavated beds of the reservoirs. At Koregaon, in the Bársi taluka of Sholapur, the same thing is to be seen. A large lake, constructed at great expense, is no longer what it was intended to be—the soil of the overhanging hills has in a great measure silted it up, and babul trees have encroached upon its territory, while its dam has been thrown down by the headstrong rush of water into the basin, which silt had rendered incapable of holding what it was intended to when constructed.

In all directions in the northern districts, far and wide, bhandhárás or dams across streams are to be seen inoperative—they have either been tumbled down and swept away by uncontrolled torrents, or the storeage area behind them has been filled up by silt.

Along the foot of the Sátpurás, in the Tápti valley of Khandesh, a large tract of deserted country is to be seen at the present day. Numerous broken bandhárás testify that the denudation of vegetation on the upper lands was complete at a certain period of their history, and it is reasonable to conclude that the hundreds of masonry wells existing in the locality ran dry at the time that these dams were swept away, and that the result of this denudation, and of the deprivation of water storage for irrigation, was one of the causes of the exodus of population that took place. Wars and strife, too, had something to do with it. Now the country is covered with vegetation, and the wells hold water, but the cultivator has not yet returned.

In connection with the Nasik districts it has been reported by local officers that increased cultivation of sugar-cane has resulted from the protection of forests; that fields adjoining the forests, which could not be profitably cultivated a few years ago, now produce good crops of cane, and that whereas this cultivation now obtains in the villages where forest reserves have of recent years been formed and protected, it has not yet returned to the villages in which there are no forests.

IV. What steps should be taken towards reboisement, &c., &c.?

In the first place, I think that as much as possible of the hilly land, and of the undulating broken ground in the country, at present denuded, should at once be brought under protection.

The lowest stratum of air contains the greatest quantity of aqueous vapour, and hence it might be expected, *ceteris paribus*, that more rain would fall on low-level plains than in elevated countries. The contrary, however, is the fact. The increase of rain is gradual as we ascend. This may be accounted for satisfactorily by the colder air on elevated places, and by the clouds resting on the summits of mountains without descending into the plains.

If mountains be protected from solar radiation by forests, and if the transpiration from an enormous leaf surface has the same cooling effect as terrestrial radiation, it stands to reason that the effect of elevation is still further augmented; the fall of rain is heavier.

Forests should likewise be formed in the plains and more level grounds, where trees afford important assistance to agriculture by promoting natural irrigation, by preventing undue evaporation and exhaustion of soil, by providing manures, &c.

Trees extending along the sea-coast, by interlacing their roots with the land and alluvial soil, help to render it more compact; they also assist in arresting the mud deposited by rivers, and in forming the so-called deltas at the estuaries of the latter.

Forests planted on the banks of rivers have the effect of binding the soil and preventing erosion, and of confining the stream to its proper channel.

The absence of wood for domestic purposes in the Deccan, more especially, requires the formation of forest in the plain countries of Satara, Poona, Sholapur, Ahmednagar, Nasik, and Kandesh, where the bad effects of the scarcity of wood upon the domestic, public, and social concerns of the people are visible; the excrement of cattle is used extensively to cook food, and the fields are thus deprived of a valuable manure.

V. The *modus operandi* of reboisement.

The more expensive system of artificial planting by means of nurseries and transplanting should be undertaken in connection with favourable localities, where soil is deep and suitable and water at command. Casuarina plantations on the sea-coast should thus be formed.

Plantations of babul, bor, nimb, &c. on black soil in the Deccan, on banks of rivers, &c., should be made by ploughing the ground and sowing the seed in the furrows.

But the area of denuded hills, of lands possessing poor soil, is so very extended that a much less expensive *modus operandi* must be adopted in connection with these localities. Seed must be collected in the neighbourhood in large quantities and be brought from distant forests, to be thrown profusely by hand, at the commencement of the rains, over the denuded lands, which must be protected most strictly against cattle grazing, against cutting, and against fire. Conservancy is the keystone of success in the reboisement of denuded lands, and this conservancy must be real and not nominal. Guards must be appointed to watch, and the law, by deterrent punishments to destroyers and trespassers, must support the guards.

VI. Can planting and conservation be effected without interfering with the vested rights of the people, &c.?

No vested rights of the people will suffer. As a rule in the Deccan the people have as a part of their

Chap. I, Qn.

Bombay.

Mr. Shuttlewor

holdings in the hilly part of the country pôt kharâb land, *i.e.*, unarable, upon which no assessment is charged, and therefore grazing lands have been provided them in their own holdings.

If rights of the people do come into collision with the planting and conservancy arrangements, then, in the interests of the country and public, the exercise of the rights must be suspended for a time; in a few years, when the vegetation has made pace, the exercise of these rights may again be permitted, and will then be more valuable than before.

VII. Which method of reboisement would be the easiest, cheapest, &c.?

The system of broadcast sowing of seed, with closure against man, cattle, and fire, is undoubtedly the easiest, the cheapest, the quickest of operation, and most effectual where such a very large extent of denuded country presents itself as is contained in the northern districts.

VIII. What extent, and on how large an area, could either method be followed?

The physical configuration of a country and local circumstances must determine the portion of it to be under forest protection; as a general rule, 25 per cent. of every district should be under forest or tree growth.

N.B.—One final suggestion remains to be made in addition to the foregoing, viz., it should be provided as a compulsory measure, that the strip of waste, unassessed land belonging to Government, dividing fields, and forming the boundaries of the latter, should be planted with trees by the holders of adjoining fields, who should protect the trees, and while being prevented from cutting them should have the legitimate usufruct of the trees.

Lieut.-Colo: Peyton.

Southern Division.—There has been denudation outside the province, and along the western ghats in Goa and Sáwantwári territories bordering on Kanara and Belgaum. From considerably below Unshi to the Amboli ghat the forests have been almost entirely destroyed by kumri cultivation; also, many of the hills show the loss more or less of their surface soil, and have become barren of all but the most scanty vegetation. Within the province, in Kanara, along the ghats, this evil was checked something over 20 years ago, and has since been kept well in hand, but on its north-eastern frontier much forest or tree-clad lands have fallen to the axe of the cultivators in their advance, not, however, to any appreciable extent, and only to satisfy their fair and legitimate wants in fresh lands to cultivate. In the Bidi taluka of Belgaum denudation has been greater, and in the Belgaum taluka more again; in the latter, in particular, the hill sides have been seriously encroached upon, and broken up for cultivation more than was right. Around Belgaum, too, the hills have been much denuded, but those that roll east and occupy lines through the centre and southern portion of the Kaladgi districts, having more or less the Ghratprabhá and Malprabhá Rivers running through them, have suffered serious denudation. In Dharwar, along the southern border touching Mysore, the double range forming the Másur valley has been seriously denuded, and so also the rather lofty Kapat range south-east of Dharwar. Both ranges touch almost the Toongbhudra River.

The Goa and Sáwantwári tracts, denuded by kumri cultivation, may be roughly put down at between 700 and 800 square miles, and the other areas may be ascertained with some exactness from the records of the Southern Maratha Survey.

Of the effect of denudation on the actual rainfall I cannot speak, but my feelings and senses incline me to think the fall of rain is sensibly affected by the denudation of forests, but of the other injurious effects there cannot be doubt. It has often appeared to me in the direction where the deforestation has been indicated, in Dharwar and Kaladgi especially, that year by year the sudden rushes of water from the hills are destroying the culturable lands immediately below them, causing serious erosions and siltings. Many parts, in my opinion, of the lands along the base of those hills are fast being made arid from receiving rushes of water charged with kunkur (gravel) and mere sand, instead of the more equal distribution caused by the roots and stems of trees and shrubs, carrying with it the thick leaf-mould deposits of the deciduous trees and shrubs that once covered the hills, but which improvidence and waste have destroyed to a very sensible extent indeed.

Mr. Wallin

Poona.—Regarding the subject of "inquiries remedied by reproduction of forests," I would cite one or two instances. The village of Malegaon Budruk, in the Mawal talooka, is situate on the crest of the western ghauts. The valuable mountain forests of this village, 2,430 acres in extent, were demarcated seven years ago and are vastly improved. Grass is plentiful and the water-supply in the stream near the village has greatly increased, so much so indeed that a well built five years ago, with the help of local funds, at a cost of Rupees 250, is now made scarcely any use of by the people. In the words of the patel and kulkarni of the village, "You have here now, in the "low-lying lands, only to dig a few feet deep for "water and you get it." In a re-entering angle of the high mountain reserved for forest to the east and north of the village, and about 400 feet above the village level, is situated the rise of the Ranzani stream, an important tributary of the Andra river, which is a tributary of the Indrayeni, which is again an affluent of the Bhima. To my certain knowledge, no water remained in the high sloping bed of this stream six years ago after the month of February of each year. There was during May last to be found there flowing pure clear mountain-spring water. The people inform me that year by year the water is increasing in volume, and this fact and this subject generally have from my point of view a very deep importance. It is by the help of the countless numbers of little streams which now flow, most of them only during the rainy season, from the denuded hills and mountains, but which should be perennial in their flow, that nature seeks to maintain a permanent supply of water in the important rivers flowing eastward to the sea. The Ranzani stream is one of the first links in the water-supply of the Bhima, and having its rise in a mountain now well clothed with large vegetation, it is perennial in its surface flow.

Again, Torno is a village in the Khed taluka about three miles from the crest of the western ghauts, and is situate at the base of the mountain which divides the Andra and Bhama valleys. The forests here were demarcated in 1870–71, and have greatly increased. At the time of demarcation, and for about four years after, the water in the only well (three feet broad) of the village dried during the month of February or March of each year. The people then procured water from Tambrachi Waddi, a distance of three miles from Torna. The excavated but unbuilt well is situate at the base of the now well-wooded mountain on the bank of a nullah, a tributary of the Bowli river, which is a tributary of the Bhama, which is an affluent of the Bhima. There were last May nine feet of pure mountain-spring water in the well, which has now been made by the people themselves 15 feet broad. The water has risen to within five feet of the surface. The people here most freely acknowledge that this new supply of water is due to the increased vegetable growth on the mountain, and I am perfectly certain of it.

MADRAS.

MADRAS.

Sir W. R. Robinson.

The advancement of population and cultivation has led to the substitution of agriculture for scrub and jungle through great tracts in South India of late years, without any evidence of injurious effects on the south-west or north-east trades which supply South India with its moisture. The stratifications of the earth's surface which fill the country's springs—deep-seated enough to be uninfluenced by surface verdure—and supply its streams have not changed; and cultivated land has doubtless proved here, as elsewhere, a better absorbent of moisture than scrub and jungle clad waste. Forests have not been arresting famines in India, nor has their denudation been affecting the solar heat in general, in recent years. Human health has improved where formerly malarious fevers searched the pioneers of cultivation under jungle influences, and the haunts of wild beasts have receded. I think, therefore, that this fashionable scare need not trouble the Famine Commission in relation to the failure of the monsoons and natural droughts arising therefrom. At the same time, good and judicious forest conservancy and plantation are needed here, as elsewhere, for their own obvious reasons. But State forest conservancy will only be acceptable to the people where it is pursued without traversing legal and prescriptive conditions, and is divested of confiscatory wrongs. The people, too, may be aided in the conservancy of their communal and private forests and jungles by judicious direction, without traverse of prescriptive rights or advancement of novel claims by the State. I can only hope that fanciful famine indictments are not now to be added to the difficulties and theories of the forest question. As a famine question probably food areas may be preferred to forest and scrub areas; and the Commission may be asked to consider the cross allegations—whether so-called forestry has increased the cattle mortality, destruction of manure, and so on.

Mr. Pennington.

Tinnevelly.—The denudation of the forests in this district has been the constant theme of complaint for many years, and it has been alleged that the violence of floods has been sensibly increased thereby. It is certain, at any rate, that last December was distinguished by two of the most violent floods ever known in the valley of the Tamrapurni. There has been no reboisement to speak of, though some good has been done by an informal kind of conservancy. No doubt, the proper remedy for the forests is strict conservancy of all the real jungles, sufficient space being left on the outer slopes for cattle-growing and firewood. Such conservancy can, in my opinion, be carried out without any improper interference with the vested rights of the people, which, however, required to be carefully regulated.

Ir. Gordon.

Bellary.—There has been no sensible denudation of forest in this district within recent times. The Sundur state is the part which contains most forest. This is being yearly felled, and no steps are taken to supply the place of the trees which fall to the axe. There are no statistics showing over what area scrub has been cut down.

The district may be said to be devoid of jungle, although scrub exists in parts. These tracts, if preserved, would probably bear jungle of some size. Measures are being taken to conserve a portion of the scrub in Gooty and Anantapur taluks, and the experiment, if successful, will probably be extended. In this instance a sufficient portion of the tract will be left to the villagers for their use. Planting would be attended with great expense, except on the banks of perennial rivers, and would probably, except under such circumstances, fail to produce large timber. Owing to the stratum of rock to be found at a short distance from the surface, trees are stunted throughout such portions of the district as I have observed. In the black cotton soil nothing except the babul and the margosa appears to thrive. It is to be doubted if the hills in this district, except those in the Sundur state, were ever covered with jungle. Their rocky nature in many cases renders it very improbable that they ever could have been so. Such statistics as exist go to show that there has not been any general decrease in the fall of rain for the last 20 years.

Mr. Price.

Chingleput.—There has been sensible denudation of fresh lands within my experience; but it is impossible, as regards this district, to state, as there are no books of reference or statistics available, what extent has been destroyed. When looking over some old letters a short time ago, I saw reference to jungles which now no longer exist. I do not think from the look of the country that there ever could have been much real forest in it. It must have been pretty nearly all scrub. The cocoa-nut and bamboo were introduced within a very recent period, and so were the now all-pervading casuarina and many other trees. The Striharikottah jungles, which now belong to Nellore, but which formerly were part of this district, were, within the memory of living man, dense thickets filled with deer and other wild animals. They, until a few years ago, were hacked to pieces for firewood for Madras, and have only lately been conserved. This district being so exceedingly flat, the only way in which deforestation would appear capable of affecting it would be by decreasing the rainfall. There are no facts obtainable to show whether this has occurred or not, nor has there been, as far as I know or could ascertain, any injury resulting therefrom.

My knowledge of the Salem district and its forests, in which I took some interest, extended over a considerable period. Within the eight years during which I was there I recollect large patches of jungle which, when I knew them first, were thick and heavy, giving cover to abundance of large game, completely cleared away for cultivation. I know of acres of forests hewn down for the railway, and of miles of it destroyed by fires, which with a sufficient forest staff could have been protected. I know of two spots where, within my own memory, there were springs which ran all the year round, and which in consequence of the felling of the jungle have been entirely dried up. One was on the Melgherry hills, the other at a place called Kodagur. I have seen during the showers of the south-west monsoon clouds pass over a large open clearing, and be precipitated in rain the moment that they were over a sholah. I consider from what I have seen that forest does affect the rainfall. The clearing of forest which is within my own knowledge has most certainly affected the permanency of water in the jungle streams, which are the feeders of the larger rivers, and I could personally point out the particular spots. In the northern portion of the Salem district, where the country is rolling and soil red earth, I myself know places where the clearing of scrub jungle for cultivation has led to the appearance of large nullahs, which are constantly growing; this, however, is not very extensive. It is as yet far too early for any one to form an opinion as to the effects of the reproduction of forests in spots where it has been cleared away. Efforts to this end have

CHAP. I. QN. 2

MADRAS.

Mr. Price.

been largely made in the Cuddapah and Salem districts, both of which I know well; but the forest which has by these means been raised is, as to that which preceded it, as a toddling child is to the full-grown man. I have not the slightest doubt that the clearing of the forest has exercised an injurious effect upon the streams. I consider as a means of reboisement that all hill jungle should be conserved, and that the cutting of timber or occupation of ground for cultivation for a certain distance along the margins of all streams should be prevented. I would at first combine artificial planting with keeping out cattle and fires; but I would not in restoring follow the course adopted for many years by the Forest Department, viz., planting in trenches or planting out and watering. The theory which I have long held is that in making up forest one should follow nature as much as possible. She distributes seeds of different kinds in such places as are favourable for their germination and growth, and all that I would therefore do would be to collect large quantities of the seeds of jungle trees of the adjacent region, and just before the rain send men round with bags of these and a mamotie, and instructions wherever there was a blank space and a favourable looking spot to dig a small hole, sow seeds, and leave them to take their chance. I would keep out all goats and sheep; they and fires are fatal to young forest. Cattle are not so bad, but still they are better out of jungle until it is well up. This plan of sowing I tried in 1865 on the hill near Arcot railway station, but I was moved the next year, and I believe that my successors did not trouble themselves any further with the experiment. I did not see the hill for some years afterwards, but when I did I could plainly perceive in places the effect of one year's work. The sub-collector, at my suggestion, is trying my plan on the low bare hills about Chingleput. In the Salem district I left comparatively small patches of jungle in the plains, *i.e.*, which I had made by ploughing the land and sowing broadcast such seeds as were suitable to the soil. I have recently heard that these bore the late drought well, and that they have grown up in a surprising manner. I have experimented upon trees, of which in two districts I have planted altogether pretty nearly half a million in many ways, and I am convinced that the plan which I have mentioned is the cheapest and most effective. Sheep, cattle, and especially goats must however be kept out for four or five years, and precautions against fire, by cutting rides and clearing them every year, must be taken. The question of the vested rights of the people is one which requires systematic treatment. In both the Salem and Cuddapah districts there are miles upon miles of forest land, which could be conserved without injury to the people, or depriving them of sufficient space for pasturage. The native custom has been to consider all Government waste land grazing ground, upon which anyone who chooses may feed his cattle, &c., may hack the saplings to pieces to as great an extent as may please him, and upon which, when he thinks it desirable to improve the pasturage, he may light a fire and burn up thousands of young trees in order to procure fresh grass. These may be called vested rights, but I do not consider them such. The destruction of the forest has gone on to such an extent over the parts of the presidency with which I am acquainted that it is high time, if anything in the way of conservancy is intended, to take the matter in hand. It is quite possible to work this in such a way that the people, cattle, &c. shall be excluded from certain tracts until they have grown up to that degree at which grazing will do no harm, when another piece might be taken up. I would certainly not allow the people to have the "run" of the jungles in the way in which they for many years have.

Mr. Foster

Godavery.—Considerable denudation of the forests is continually going on through what is called pôud cultivation. The ryot cuts down the trees and burns them and sows his seed in the ashes. He sometimes sows a second crop on the same land, but he generally moves to another block after he has got one crop and burns the second block down. He will not come back to the first piece for about eight or 10 years. I think, as a general rule, he prefers never to cultivate the same piece of land twice in his lifetime, provided he can find other pieces of jungle to burn.

Mr. Logan

Malabar.—The statement given below shows approximately the extent of forest cleared, within the last 20 years, for agricultural purposes. In Malabar, for a long period, promiscuous and injudicious felling of forest timber trees by private parties has been going on to a mischievous extent. No attempt is ever made to plant up the tracts thus denuded.

As yet, however, no great injury has been caused. In some places a sensible diminution in the permanence of water in the subsoil is, I am informed, perceptible in the case of fields and gardens situated in the midst of detached hills on which there was formerly a good deal of scrub jungle now no longer in existence. As regards the rivers, however, deforestation has not yet, fortunately (except, perhaps, in the Cherakal taluk), been pushed sufficiently close to their sources either to cause an appreciable diminution in volume or to check a continuous flow of water throughout the year.

The best remedy that suggests itself to me for the evil threatened is to take steps to bring under conservancy as large an extent of the forest tracts as possible, either by private arrangement with the proprietors (for the largest proportion of the forests is considered as private property in Malabar), or, if necessary, by legislative interference under the Forest Act, 1878.

I do not, however, think that the time has arrived when further legislation should be had recourse to as far as Malabar itself is concerned, though possibly district officers on the eastern side of the ghats may have good reason to take exception to the denudation of the ghat forests situated in this district.

I think it is worth while considering whether we might not, with advantage to all, extend forest conservancy in the district by private arrangement with the proprietors where such exist. A good beginning has already been made, *e.g.*, in the case of the Conolly teak plantation near Nelambur on the bank of the Beypore River.

STATEMENT showing ACREAGE of FOREST LAND in the MALABAR DISTRICT cleared for purposes of CULTIVATION during the last twenty years.

Taluks.	Extent in Acres of Land cleared.	Remarks.
1. Cherakal - -	348,783 3 5	The extensive clearing in Cherakal was for ponom (kumari) cultivation. The land was not permanently cleared. Scrub jungle grows up in the years when there is no ponom crop. In Wynad the clearing was chiefly for coffee.
2. Kotoyam - -	20,230 2 0½	
3. Kurambranad - -	40,580 5 4	
4. Wynad - -	119,566 0 0	
5. Calicut - -	3,312 4 0	
6. Ernad - - -	4,593 0 0	
7. Valuvanad - -	2,019 6 6⅜	
8. Palghat - -	13.695 0 0	
9. Ponani - -	—	
10. Cochin - - -	—	
Total - -	552,779 4 15⅞	

HAP.I. QN.23.

MADRAS.

Ir. Webster.

Coimbatore.—There has been a very great denudation of forest in this district within the last 40 years. We have no statistics showing over how much area forest or scrub jungle has been cut down, but lands are now miles away from the forests which, within the memory of man, were covered with dense jungle and were overrun with wild elephants. I do not know of any specific facts which lead me to think that the deforestation has caused injurious effects as regards the fall of rain, though it has had many evil effects, which I will notice. I do not think the deforestation has affected the rainfall or the cultivation to any serious degree; seasons were often remarkably unpropitious before the forests were cleared. The situation of this district is, however, peculiar, being immediately behind the high ranges of the western ghats which turn the rains, and the rainfall has always been very scanty.

As regards the supply and permanence of water in the streams, the people all say that the streams run dry much sooner now than they did formerly.

The deforestation and the clearance for cultivation of the waste lands (scrub or grass) has considerably diminished the grazing ground of the people, and they have, in consequence, to send their cattle further in the hot weather. The supply of firewood is also diminished, and, in consequence, straw and cowdung are burned that ought to be put in the soil. No attempts at reboisement have been made in any systematic manner.

r. Horsfall.

Kistna.—There has been a gradual and progressive denudation of forest. The testimony of all officers is unanimous on the point. It is a fact within the personal knowledge of every official of any service in the district. Formerly, the Government ryot was not allowed to cut the trees on his puttah lands; but this restriction was withdrawn some years ago, and within my own knowledge many valuable trees, such as tamarind and mango, were cut down and sold. In some instances, lands were taken up temporarily for the sole purpose of cutting the timber thereon, and as soon as this object had been effected thrown up again. This disastrous procedure has been checked to some extent by the rule that applicants for fresh lands have to pay the value nominally of the trees standing thereon. The rule is good as far as it goes; but is, I fear, very generally evaded. There are no statistics showing the extent of forest or scrub jungle which has been cut down. Such lands were entered in the old accounts as porumboke. Up to the time of the recent survey, the area occupied by forest or scrub jungle was not ascertained; but there is no doubt that, as cultivation has gone on increasing from year to year, the jungles have been encroached upon. Between Faslis 1271 and 1274 the cultivation of cotton increased from 100,000 to nearly 250,000 acres; the greater portion of the increase is known to have been jungle taken up for cultivation.

The difference in area under occupation in Fasli 1269, when the Kistna district, as now constituted, was first formed, and that under occupation in Fasli 1287, amounts to nearly four lakhs of acres, being 14 and 18 lakhs respectively. So far as is known, there has been no diminution in the rainfall. A rain register has, however, only been kept since the year 1852; nor has any alteration been observed in the abundance or permanence of water in the streams, wells, and subsoil. No noticeable denudation of soil has occurred. The soil is said to have deteriorated to some extent owing to cattle dung being used instead of firewood, which has become scarce.

There has been no reproduction of forest.

ieut.-Colonel Beddome.

The denudation of forests for actual cultivation—paying assessment—has been very great during the last 20 years, as I have ascertained from reports received from the collectors and forest officers of all our districts, and it is of course very much greater in some districts than in others. In Wynad it is said to be 22,526 acres, and it has been very extensive on the Nilgiri. In the face of railways and an ever-increasing population, it must of course go on extending, and there is still ample room for much extension, though of course there must be a limit. Revenue officers will be too anxious to open out the hill tracts of their district and realise a revenue from the land, and can scarcely be trusted entirely with the question as to what tracts are to be reserved. This should in future be almost entirely under the Forest Department, who should be responsible to Government that the water-supply of the country is not affected to any great extent. Unless this reservation be placed under the trained and responsible department, the very tracts which it is most desirable to reserve will often be the first to be alienated.

Coffee and tea bushes will never protect the soil and water-supply in the way that forest does; the soil being constantly broken up is washed away, and there is no accumulation of humus.

Coffee appears to be anything but a permanent cultivation, as shown by the long list of deserted estates in the Wynad.

The practice of felling and burning hill forests for temporary cultivation (kumeri) is most injurious to the country, and must sooner or later be put a stop to altogether. In some cases this pays assessment, but there is much carried on illicitly, of which no returns could be forthcoming. Only two or three crops (sometimes only one) are taken off the ground, which is then deserted, and reverts to jungle, but only again to be felled and burnt after a few years, each successive growth being poorer than the one preceding it, till in time the tract becomes the merest scrub or bare rocky ground with scarcely any soil. This I have seen exemplified in many of our districts.

Mr. Ferguson, the forest officer of Nilambur, explains the process of forest gradually turning into the poorest scrub, and he states that 4,000 to 5,000 acres are thus destroyed annually in Malabar.

Messrs. Peet and Morgan, the forest officers of Coimbatore and Wynad, state that kumeri holdings are often not the bonâ-fide property of hillmen. They often belong to well-to-do ryots and merchants in the plains.

Apart from the question of the inroads of cultivation and the destruction of forest by felling and burning for temporary cultivation, there is the fact that almost all our dry deciduous hill forest tracts are rapidly deteriorating before armies of goats and cattle, constant fires, and the unpitying axe and bill-hook of every goatherd or cowherd. The jungles and grazing grounds below the hills and often on the slopes have of late been cleared for cultivation, and the people now invade our mountain forests. This is a far more important question than either of the others, and cannot be grappled with except through a Forest Act. Cattle-grazing beyond the jungles or forests of village limits must be taxed, and under the supervision of this department, so that the graziers can be punished if they take axes or bill-hooks into the forests or light fires. Grazing must be restricted to certain tracts, and large tracts of forests must be reserved against it and fire, or only be open by blocks in rotation, as can be arranged under scientific and systematic management.

Our forests are still vast, and it is not too late to introduce systematic conservancy, which can only be accomplished with the assistance of an Act and strict rules; but the destruction has been rapidly increasing year by year since the introduction of railways, and

CHAP. I. QN. 2.

MADRAS.

Lieut.-Colone
Beddome.

there is not now much to be time lost. Unless we shortly have a Forest Act and a regular system of reservation, I feel certain that another two or three decades may materially alter the climatic conditions of many of our districts.

The Forest Department has only been in existence 22 years, and for its first decade or more it was only a department for the collection of the revenue from the forests belonging to the State. Of late years the more important questions connected with the upkeep of forests have attracted much attention, but the department has been, as a rule, utterly unsupported by any of the revenue authorities; the native officials particularly have been in every way opposed to it, and have thwarted it in every way, as they have suffered much in pocket and in influence by its introduction, and its rules have in every district, it is feared, been more honoured in their breach than their observance.

It is possible that Government might deal with the State forests without the introduction of an Act, but even this is very doubtful. There are however vast tracts of mountain forest belonging or supposed to belong to private individuals, the upkeep of which as forest land is absolutely necessary in the future unless the water-supply and climate of the country are to be seriously tampered with and to deteriorate year by year. Government must be in a position to say that certain mountain forests, steep slopes, or ravines protecting the water-supply must not be destroyed, that they must be treated as forests, *i.e.*, worked only to their reproduction, but not be cut down or burnt, whether they belong to Government or to private individuals.

The protection of every mountain stream is of more or less importance, but I may just mention two or three all-important questions which, if they do not receive attention very shortly, may bring much ruin on the country.

The magnificent evergreen forests protecting the slopes of the ghats in the Tinnevelly district are now threatened with destruction for coffee; in fact, the destruction has already commenced. Vast tracts of these are now acknowledged as the property of Native zemindars, and if their clearance is effected the Tamrapurni river will suffer considerably. Tremendous floods and corresponding droughts must be the result, and the district may be ruined. It will only be the work of time.

The vast evergreen forests on the mountains between Coimbatore and Manar are now threatened with destruction for coffee, &c. These protect the sources of the Bhavani river, and their destruction would seriously affect that river. It is not known whether these forests belong to Government or to a Malabar Nair who has lately claimed them.

The splendid evergreen forests on the mountains at the south-east end of the Cumbum valley protect the sources of the Vaige and Shurli rivers; if these were destroyed it would bring ruin on the Madura district. Large tracts of these belong to the Gantamanayaknur zemindar, and some belong to this Government; but it is believed that Travancore disputes the right to portions of the "highway"—a most important tract with reference to the water-supply of the Madura plains.

The forests on the Nilgiri, Wynad, and Coorg have been rapidly disappearing during the last 10 or 20 years. If this destruction is allowed to go on the Cauvery river must in time be seriously affected. There are still vast tracts of forest, and many splendid forest-clad ravines protecting numerous streams, but what if they all go? And if there is no legislation on the subject and no official reservation to be guarded by a responsible department what is to prevent it? At the present rate of destruction there would be probably nothing left in another century or less.

Collectors can furnish returns showing the amount of forest-land cleared for cultivation and paying assessment during the last 20 years or so; but this will not show the numerous tracts illicitly felled for hill cultivation, and no returns can represent the vast tracts of forests naturally deteriorating by reason of unrestricted grazing without supervision and fire.

To obtain any reliable specific facts as to the mischief caused by deforestment would require observation and data collected for a long series of years.

The Forest Department is only of very late introduction into most districts, and little or no attention has ever been given to questions of this nature. The revenue authorities seldom remain more than five or six years in any particular district, and they very rarely go into the mountain forests, or know what is going on in them. It is rather to other countries, where statistics have been collected for many years, and where the forests have been allowed almost entirely to disappear (which is anything but the case as yet in India), that we must look for facts of this nature. The numerous books now being published on forestry and kindred subjects in Europe and America are full of statistics of the mischief caused in many comparatively temperate countries by the destruction of mountain forests. Can it be doubted that the same destruction can go on in a tropical country like India without similar results? Considering our vast tracts of forests and our splendid chain of ghats and isolated blocks of hills it must be slow, but it will be equally sure.

Mr. Turner, lately assistant agent on the Jeypore hills, with only a four or five years' experience of the district, spoke to the drying up of streams caused by deforestment. Major Jago, the officer in charge of the Nilgiri, and Mr. Morgan, lately in charge of North Coimbatore, speak to similar facts in their letters now forwarded. The clearing away of forests protecting a spring or head of a stream almost always dries it up, and the denudation of the forests protecting the slopes of ravines down which it runs seriously affects it, causing a great rush of water after heavy rain and corresponding diminution at other times. These facts are too patent to require proof, but can be established by most forest officers. To illustrate the ill effects of deforesting steep mountain ravines I could mention nothing more appropriate than the Coonoor ghat ravine, the approach to the Nilgiri from Mettapolliem. I have been up and down this many times nearly every year since 1857, and watched the gradual destruction of the forest, trying hard to stop it, but with what result is very evident, although Government have passed several orders forbidding the clearance of the forests (this is the result of forests being under the revenue authorities instead of the Forest Department, and no one of course being responsible, as the revenue authorities are constantly being changed). When I first knew it the ravine was all forest-clad, both sides, and in the heaviest rain there was no very apparent wash of the soil, no landslips or rolling-boulders, and the rivulets feeding the river down the centre of the ravine all running tolerably clear. Now the north-east slopes or the slopes above the road have been almost entirely deforested, and it is quite dangerous to go up the ghat during very heavy rain, which often occurs in October, November, and the beginning of December, and sometimes in May. Boulders of rock of various sizes from several cwts. to 100 tons come rolling down, rendering the old and new ghats impassable and destroying the bridges, and the soil in many places pours over the road like lava, and the water in the streams is of the consistency of cream. Most of this deforested land has been planted with coffee, and many people would argue with advantage to the State; but the forest officer says steep mountain slopes like this must be protected from denudation for coffee, as it is utterly impossible that the soil can last very long. The forest has now been replaced by coffee, and in the future coffee will be replaced by a rocky barren mountain slope with no trees or cultivation of any sort, and the State will then say how improvident our ancestors were. Tree-planting will then be too expensive, and though in the course of time protection and conservancy might even then cause the débris of

AP.I. QN.23.

MADRAS.

eut.-Colonel Beddome.

grass and weeds, &c. to form a soil which in time would produce jungle and eventually forest, this would in any case be the work of centuries and perhaps in the face of such a rainfall impossible even to the length of time. Deforestment on the other slopes of the same ravine has now commenced. I mention this particular ravine as one with which most people in this presidency are acquainted, and the mischief brought about in which has been noticed by many even casual observers. The same results, however, are occurring in all other steep ravines brought under the same treatment.

Artificial reboisement by planting on our mountain slopes and hills will be far too expensive, and we have not yet arrived at a stage when it may be said to be necessary. Natural reboisement by reservation of tracts against goats, cattle, and fire is all that is necessary, but to effect this a Forest Act is necessary, and forest officers must have more power.

No forest conservancy could probably be effected with the consent of the people, if they were consulted.

They, of course, cannot be expected to think or care about the future. Present profits and present comforts and privileges are all they think of. It is the State that must take care of the future, and legislate so that the introduction of railways, an ever-increasing population, and cultivation are not allowed to bring ruin on the country at a future date, even though that date may be a distant one. It is difficult to say what the vested rights of the people are. They have never been defined, and are, for the most part, only privileges which can be regulated or restricted by the State as circumstances require, and which, if not so regulated and legislated for, must rapidly disappear altogether; as forests will cease to exist without systematic management and many restrictions. It is calculated, however, by this department that in most districts one-fourth or one-fifth of the hill forests might be strictly reserved without much undue interference with present privileges. Every year, however, will make the question a more difficult one. The sooner it is grappled with the better. It is with the private proprietors of forest that there will be the greatest difficulty. They, of course, will look to immediate profits, and if by cutting down or selling a forest they can realise a revenue they will care nothing what may occur in the future from such action. This is a subject that can only be touched by special legislation.

MYSORE.

Mr. rishnaiengur.

MYSORE.

The measures for the reproduction of forest having been adopted only a few years ago, and the conserved forests being yet too young, I am not now in a position to say that the evil caused by the clearing of the wood has been remedied to any extent. The step which I propose towards reboisement is that which has been adopted in this district to some extent, and that is, simply conserving the suitable tracts, putting down there in the rainy seasons the seeds of indigenous trees ordinarily grown in the locality, preventing the cutting of the saplings and keeping out the cattle, especially goats and sheep, as this method is cheaper and more successful than the artificial planting which is so costly, and which in a financial point of view is impossible to be carried on extensively. Simple conservation such as that adopted in this district is easier, and the desired object can be gained more effectually with little or no cost, if we carry the ryots with us. There would be no necessity to interfere with any vested rights of the people, as there is plenty of Government inarable wastes in the country* to which no private individual has any claim, and the co-operation of the ryots can be secured, if judiciously managed. For further particulars of the system under which conservancy of forests is carried on in this district, I beg to refer to my memorandum dated 31st July 1878, which was submitted to Mr. C. A. Elliott, C.S.I., Secretary to the Famine Commission, as desired by him in a demi-official letter.

Memorandum on the Management of District Forests in the Kolar District of the Mysore Province.

1. This district has or had no forest producing any valuable timber such as teak, black-wood, and honne, but there are many tracts where other species of wood, such as jalari (lac), babúl, nim, karag, &c., could be grown, and numerous forests of this kind appear to have been in existence in former days. These had all, I believe, been formed and conserved by the villagers with the aid of kavalgars or watchmen, who were, as a rule, remunerated by the village agricultural community, the Government only supplementing the remuneration by small grants of inam lands in some special cases; but these forests gradually disappeared, as the patels gave up their interest in them in consequence of their service inam lands having been thoughtlessly resumed about 60 years ago by the Government of the day.

2. I was sadly struck with the barrenness of the country when I first took charge of the district in 1864; and having spoken to the intelligent and influential patels on the subject, pointing out to them the great benefit the ryots would derive from having wood in their neighbourhood, and assuring them that their services in conserving forests would be recognised by the present Government, they conserved suitable tracts within the limits of their villages, and their example is now generally followed by others.

3. At the outset there was, of course, some difficulty in reviving the good old custom of the country about the conservation of forests; but it is no longer felt, as under the arrangements made in this district the sympathies of the very parties from whose reckless and clandestine felling of the wood we have to protect the forests are enlisted, and they are made responsible for their conservancy, bearing themselves all the cost of it, instead of employing any outsiders to watch the forests and subjecting the ryots to all sorts of annoyance and hardship.

4. The following are the arrangements:—

I.—No lands cultivated or cultivable which are close to the village, nor those conveniently used as pasturage common to be taken up for forest.

II.—Mountains and hills, and in their absence other uncultivable lands at some distance from the village, to be reserved for growing wood.

III.—In rainy seasons, the ryots to put down in the reserved tract seeds of indigenous trees commonly grown in the locality.

IV.—The patel to employ one of the village servants where available, and some one else in other places, to watch the forests of his village, making arrangements with the ryots about the remuneration of the servant so employed.

V.—The ryots of the village concerned to be allowed, in return for this service, to collect dried brushwood for fuel and cut long grass for thatching, &c. in the reserved tracts.

VI.—None to be allowed to let the cattle, particularly goats and sheep, into the reserved tracts until at least the trees grow to such a height that the beasts

---

* About 416,000 acres of inarable lands lie in this district alone.

Mysore.

Mr. Krishnaiengur.

could do no injury to them, and none to enter into them with any cutting instrument.

VII.—No one to fell any timber or bamboo without obtaining a license from the district officer, and no license to be issued without previously consulting the patel as to the fitness of timber or bamboo to be cut, as he is held responsible for the growth and protection of the forest of his village.

5. It is the duty of the patel to report if any mischief is done to his village forest, and such mischief is punished for either under the forest rules or the Indian penal code.

6. The shekdars of hoblies are to inspect these forests as often as possible, and see that the above arrangements are carried out properly, reporting on their condition to the amildars, who are again to submit their reports to the district officer after their periodical inspection.

7. The forest conservancy under the above arrangements is working smoothly, and the patels and shanbôg generally take so much interest in this good work that in many places they have employed men to watch the forests of their villages, either setting apart the produce of a particular portion of their own holdings or cultivating and paying the assessment of a separate field for their remuneration, and also arranging with the ryots to pay their quota of the remuneration in grain at so much for a plough; and I have also in a few cases obtained the Chief Commissioner's sanction for the continuance to the hereditary watchmen of their service inam land which had been resumed under the recent settlement of the Inam Department.

8. There are now many forests thus managed in all the 10 taluks of this district, the number of the extensive ones being 67, and their approximate area in round figures being 152,000 acres, excluding the petty village forests, of which there are hundreds. Sir Richard Meade was pleased to inspect some of these forests when he made a tour in this district in 1874, and distributed presents to some of the patels in recognition of their services in this matter.

9. There are still many tracts in this district fit for growing forest, and with some exertion on the part of the revenue officers they can also be easily conserved, as new inam lands or other emoluments are now attached to the office of patel.

10. With the object of encouraging the individual ryots to grow forest, I proposed some time ago that the system introduced by the Survey and Settlement Department of putting up annually to public auction the unarable lands for grazing purposes may be discontinued, and such lands leased out to individual villagers at a fixed pasturage rate which, in this country, is one anna and nine pie per acre, the Government reserving their right to all the wood therein grown; and the Chief Commissioner, Mr. Dalyell, was pleased to observe in his proceedings of the 7th May 1876 that the matter was under his consideration, and that information was called for from the commissioners of divisions on the subject, but the question still remains unsettled. My belief is that if this proposal be carried out, it will not only enable the Government to get permanently more revenue than the fluctuating income it now derives from the annual sale, but will also obviate the trouble of selling each number every year, a practice by which the Government loses when there is a combination in the village, and the ryots suffer if there are factions among them, one party bidding against the other, not for gain but from spite.

11. If one man is allowed to take up such tracts of land as may not be required for the Government forest, at fixed rates for pasturage, he will necessarily let trees grow, as a piece of land under the shade of trees retains more moisture, which adds to the growth of grass, whereas the purchaser of the grass at the annual public sale simply looks to his gain for the year, without caring for the trees growing in the land. This is not my mere conjecture. There are instances of lands leased out at pasturage rates in some part of the country not yet surveyed being covered with trees, while those annually sold are quite bare and treeless.

Captain G. J. Van Someren.

The question as to whether there has been within the historic period any sensible denudation of the forest in, or bordering on this province, may, I think, be safely answered in the affirmative. Wilks, in his History of Mysore, speaks of "dense forests," meaning apparently evergreen forests, where now there is little more than deciduous scrub. This is, I think, very manifest in the Anvatti Mágani of Sorab taluk.

Buchanan, in his Travels through Mysore and Canara, speaks of a teak forest at Tuduru in Nagar division where there is now no such forest. The manner in which he writes of the "woods" in the Arkavatti valley near Bidadi, of those about Magadi, and at Madgiri in the Tumkur district all seems to show that these woods then carried much more tree vegetation than they now do.

The remains of the hardwickia forests in the Sira taluk, and in the Chitaldroog district north of Bomagundanakere, show that these now desolate plains were covered with trees. At page 7 of "Notes on Mysore" (see selections from the Records of the Mysore Commissioner's Office), Succroypatam" is mentioned as forming a part of the "Oyagoor" pollium, and is described as a country "thickly wooded, like the Nuggur province." Sakrepatna is now a poorly wooded district. I have myself seen and measured a teak tree stump, with a shoot one foot in diameter, in the Siddara Kanave valley near the Mari Kanave in Chitaldroog, where, though the country is not absolutely void of trees, still it is clear that it has suffered greatly from the loss of forests which it once carried.

A careful inspection of a large part of north Dod Ballapur taluk in Bangalore district, and of parts of Kortagiri, will show evident traces of extinct tree forest; and this is confirmed by tradition. The same may be said of the country between Nelamangala and Tavarekerre, still known as the Chandanaranya, or sandal forest. To be so called it must have carried much deciduous forest. This has almost all disappeared, and with it the sandal.

The northern portions of the Kolar district suffered greatly from the raids of the Pindari freebooters in the old days, and to the devastation caused by them and the Mahrattas must be due much of the present treeless state of the country. But it is difficult to believe the tales told of the towns that were formerly scattered over the district (one of them, Adlikot, is said to have had gates of brass) without also believing in the existence of much more tree vegetation than now exists. A careful inspection of the wide plains in Srinivaspur taluk leads to the same conclusions, and these are confirmed by the direct statements made to me by ryots regarding the once far greater extent of the jungle, which is now almost entirely limited to the Mudumalagu and adjoining hills near Royalpad.

Then to come down to the present days. The demand for firewood in Bangalore alone has caused a very perceptible decrease in the extent of wooded land near Closepett, about Mirlwadi in Kankanhalli taluk, about Rajihalli in Anekal, and in the Kortagiri taluk where it borders Dod Ballapur, near Ujni Betta.

With these observations I will answer the question to the best of my ability. (1) "*In respect to the fall of rain.*" Taking an average over a long course of years, I think it improbable that, unless all the forests in Mysore were cut down at once, any very great difference would be found in the quantity of rain that falls yearly on the soil. This would result from the geographical position of the country.

HAP.I. QN. 23.

MYSORE.

Captain G. J. Van Someren.

But where there has been any local denudation of the soil rain-bearing clouds will pass over such places, and discharge themselves elsewhere where more favourable circumstances exist; or they will gradually disperse themselves. An accumulation of such instances will tell on the yearly rainfall, while the local distress is out of all proportion to the resulting diminution in the total rainfall of the province. Without being able to appeal to registers any opinion is liable to be set aside, but I would here instance the following. The forest officers who have had most opportunities of judging (Mr. King, Assistant Conservator, and I myself) are certain that more rain falls on the area covered by the Madgiri State forest than on the area covered by the rocky hills which bound it in parts and which lead up to the town of Madgiri, or on the country on the other side of the hills. Clouds coming either from the north-east or from the west drift round the hills and discharge themselves in the wooded valley. I had many opportunities of noticing this one year during the month of October, and Mr. King has arrived at the same conclusions from independent observation. To this I would add the fact that the rainfall at Bangalore itself, and in the country immediately adjoining it, is higher than it is a little further off. I attribute this entirely to the great number of trees growing in the town and its environs. There is no apparent reason to account for the fact of the higher rainfall. In my letter, No. 1423–160, of the 14th September, 1878, I have pointed out that the fall of rain in the heavily wooded valley south of the Mysore province is almost certainly due to the forests in that valley. On these grounds, I reason that the deforestation of say parts of the Chitaldroog district and of Sira taluk has injuriously affected, and continues to affect, the rainfall there.

(2) "*or the abundance or permanence of water in streams.*" At first sight, it might be thought that I should be able to produce many instances under this head to prove my belief; for there has been much felling of forest in Coorg for coffee cultivation. But here again it would be difficult to bring many specific instances which might not be hotly contested. When land is felled for coffee it is necessary to build a pulp house on it. Water power is pretty sure to prove the cheapest means of turning the wheel of the pulper, and every endeavour will be made to utilise all available water by turning streams from their natural courses. The mere fact of a stream not now running where it formerly did cannot be always or entirely attributed to the fact of the forest being felled. Farther on I will adduce reasons for believing that, making all allowances for such diversions of streams, the supply of water is both less abundant and less permanent. But I can give three instances, all in Coorg. (A) From 1862–1864 I was with my regiment at Mercara. The high road above the Chinchona gardens to Mercara then ran past Runga Chariya's estate, and the hill to the right of the road and between that estate and Mercara was at that time covered with trees. A stream used to fall on to and cross the road. It was unbridged, but paved with rough stones. It used to run all the year round, and in the hot weather was some three or four inches deep and some four feet wide. The hill is now pretty well cleared of all trees. This clearing, I think, began in 1866. In 1872, and again in 1874, I had occasion to go down the old and abandoned road in the hot weather. I noticed that though the stream apparently still ran in the monsoon it was quite dry when I crossed it, and the bed full of dust. The stream has not been diverted. (B) In the same years, 1862–64, I used frequently to go from Mercara four or five miles to the Fish River to bathe; going either by a track bordering on and south and west of the Mercara estate, or passing through the estate reached it by a track running below Bettimullay. Since 1864 a good deal of land has been cleared in this part of the country, and on two or three occasions when I went down of late years to the same point on the river I missed many little streams which used to run all the year round. These streams could not have been diverted to the pulp houses on any adjoining estates. (C) There is a small patch of evergreen devarakadu (sacred forest) along the road which, running through several of Mr. Stewart's estates and the Catharine estates, unites the Tittimatti Virajpett and Siddapur Virajpett roads. All the deciduous forest round this patch of devarakadu has been cleared away. The evergreen trees in the patch are dying out, and it is perceptibly drier and less shady, and all ferns and moss are either gone or fast disappearing. But better evidence than enumerating instances of single streams or wet places having disappeared is to be found, I think, in the fact that some kinds of birds which are usually found only in drier localities than Coorg, and which used not to be found there years ago, are now becoming numerous in parts. The common meina is by no means rare now in the coffee estates in South Coorg. This bird has only come there of late years, and this shows that the climate has altered, and must be far more dry than it used to be.

(3) "*or wells or the subsoil.*" I am not able to speak from experience.

(4) "*or the denudation of the surface soil so as to render it unfit for cultivation.*"

When a planter takes up virgin forest he finds a splendid soil, covered with humus; he fells his forest and puts down his coffee. One has only to read the numerous letters that appear in the public prints, especially those of Ceylon, which are almost entirely kept up by planter subscribers, to see how a planter's mind is exercised as to how to keep his soil from being washed away. Look at the abandoned estates between Virajpett and Wotakuli in Coorg. Years ago the hills carried high timber forests on a rich though shallow soil on rock. But the forests attracted rain, regulated its distribution, and prevented scouring. The planter's axe levelled the trees with the ground, and now almost every planter who can get away from the place is glad to go. I do not think the rainfall is less, but the soil has gone from the hill sides. A tangled mass of weeds and jungle is springing up, and years must pass before the soil can be renewed. In Mysore, I could point to an instance where the felling of 300 acres or so of a forest for coffee resulted in the same way.

"*Can you adduce any direct evidence that any such injury as you think has been caused by the clearing of forest has been remedied by its reproduction?*" As reproductive measures are what is wanted, this question is necessarily difficult to answer. But I can adduce the present state of the Devaroydroog State Forest as showing how the growth of trees during 10 years has improved soil, distributed water, increased the area of land fit to carry vegetation. It is most cheering to mark how soil is gradually creeping up on what a few years ago was bare rock. In the fuel plantations of Nundydroog large bare patches of soil are now either carrying trees or are covered with grass owing to the proximity of trees.

Chap. I. Qn. 2.

Rajputana.

RAJPUTANA.

Mr. Saunders.

Ajmere.—There is no doubt that within the last 50 years there has been great denudation of scrub jungle. It is, however, surprising how quickly it recovers itself. Five years' conservation has already made a visilbe difference in the hill sides, while springs which were ceasing to yield water in the hot weather are now perennial. The history of our attempt at reboisement at an average cost of Rs. 20,000 per annum for the last 50 years has been repeatedly reported upon, and the Inspector of Forests, after an absence of five years, has revisited the spot, and informs me he is satisfied with our success and economy. The experiment may, therefore, be considered satisfactory, for even the villagers, who at first most strenuously opposed us, are now on our side; this result has only been obtained by careful consideration of the requirements of the people and an absence of harshness in enforcing the forest regulation.

Mr. J. White.

The reproduction of forest on a considerable scale is still an achievement of the future; but where, as in parts of Merwára, the reserved tracts are well advanced, there are signs and symptoms that the results which are naturally to be expected are even now appearing. Water appears in hollows and nullahs, where it has not been wont to accumulate, and the runnels and springlets that appear in the rainy season continue to flow much longer than they used to do. My answer to this question is that 93 square miles of hilly ground are now under direct conservation, and that it is hoped that Government will find it possible to extend this area before long very considerably. Extreme care has been taken to avoid injuring the interests of the people, and the forest law provides that the villagers, who formerly enjoyed the privilege of indiscriminate grazing and felling, shall now receive a large proportion of all net profits accruing from forest conservancy. It is hoped that within a few years it will be possible to declare a dividend in some tracts; in fact, it would be possible to do so at once in some of the tracts in Merwára; and this once done afforestation or reboisement will naturally become extremely popular, and the good example set by Government will doubtless be followed by many of the wealthier istimrárdárs, who now only preserve their jungles for the sake of the wild hog, their favourite game. The chief difficulty encountered in this matter of extension of the protected area lies in the fact that the people are still semi-pastoral, and have been long accustomed to graze their enormous herds of goats and of undersized horned cattle over the hills without any sort of restriction. If half this grazing area be fenced in and protected, it is not sufficient to say that they may come and cut the grass. One man can herd 100 head without difficulty, but it would take 50 men to cut and carry the grass for so many. For the first few years of conservancy there can be no doubt that the villagers suffer inconvenience, but after that time they are amply recouped by the immense increase in the quantity of the grass and improvement in its quality. From a forester's point of view this grass cutting is, of course, most undesirable, but we have not found it possible to forbid it, and the probability of arson is never a remote one. During the late severe scarcity the value of the reserved tracts was freely admitted by the people.

Central India.

CENTRAL INDIA.

Mr. Wingat

In Bhopal, Colonel W. Osborne says, there has been no denudation.

Baghelkhand.—With the unreliable data at present in his possession, Lt.-Col. Bannerman is not in a position to answer this para. satisfactorily; but he should say that, looking to the very extensive area over which forest extends in Rewah, although denudation has occurred to a limited extent, still local wants and exports are so limited that he does not consider any of the injurious effects referred to in sub-para. 3 have been the result.

In the Rewah forests (some of the finest in India at present) conservation ought to be, and is to a certain extent, maintained. Interference of some sort seems unavoidable; and although the State claims the absolute right to those forests, it had better be done, as far as possible, with the consent of the parties, who although they may not have a valid claim, have, from the apathy of the durbar, enjoyed a right to a great deal of their produce.

In Rutlam, Mir Shahamat Ali thinks, the consumption of firewood calls for attention.

CHAP. I.
NS. 24, 25.

CHAPTER I.—QUESTIONS 24, 25.

Can any estimate be made of the number and proportion of deaths which are the inevitable consequence of famine, not being due directly to starvation, but to such privations as adults in health can bear with safety, but which prove fatal to children or the old and sickly, or to such diseases as follow in the train of famine, from eating unwholesome food, roots, berries, leaves, &c., or arise from other and obscure causes, like cholera and fever, commonly concomitant on famine? What statistics exist as to past famines to show the depopulation that they have caused, and how far it is due to an increased death-rate, to emigration, or to a decreased birth-rate? If any special census was taken after the famine, state whether any trustworthy information was obtained as to the different classes of population which have suffered most; whether the early stages of a famine affect certain classes more or less severely than its later stages; whether the loss of life has been greater among males or females, among adults or children; to what extent the birth-rate has been affected; and how far local influences, peculiarities of administration, or tenure, climate, soil, water, density of population, systems of cultivation, &c., have tended to mitigate or intensify the inevitable effects of scarcity.

If no such census was taken, state what information is to be got from the mortuary returns for the period embraced by the last famine in your province, as compared with those for ordinary periods, and what conclusions may be drawn from those returns.

PUNJAB.

The Sanitary Commissioner reports that he is unable to furnish replies to these questions, as there are no statistics on record.

NORTH-
WESTERN
ROVINCES.

pt. Pitcher.

NORTH-WESTERN PROVINCES.

These questions, which may be conveniently coupled, embrace the following points:—

(1.) An estimate is asked for of the number of deaths in a famine year directly or indirectly due to starvation.

(2.) Statistics showing depopulation resulting from past famines.

(3.) If any census was taken after any of the past famines, what conclusions can be drawn therefrom?

(4.) If no such census ever taken from which conclusions can be drawn, how far do the mortuary returns supply the void?

The Sanitary Commissioner, as custodian of mortuary returns, embracing the scarcities of 1868–69, 1873–74, 1877–78, should give the most pertinent replies to these questions. The Sanitary Commissioner, however, distinctly affirms as his opinion regarding point 1 that no such estimate can be furnished, and, further, that to form such estimates is impossible. And as regards No. 2, that no statistics are available.

Adverting to point 4, the Sanitary Commissioner comments on the mortuary returns from January to June 1878, pointing out that while the mortality for the whole of 1876 was registered at 21·9 per mille, and that for 1877 at 19·6 per mille, the mortality for the first half of 1878 was registered at 39·1 per mille. Eliminating deaths from cholera and small-pox, and taking the returns for 1877 for comparison, the Sanitary Commissioner puts down the excess of 1878 over 1877 at 318,470, "to represent the mortality resulting from the prevalent distress."

It does not seem clear why, when 1877 was a more healthy year than 1876 (which latter was in no wise a famine year), the comparison should have been taken with 1877 rather than 1876, and why the excessive cold of December 1877, January and February 1878, and the increased activity in reporting, should, as factors, have received no notice.

With regard to the ages of those who died, the figures show that children and old people suffered more than infants in arms and adults.

The opinions of the various civil surgeons on the whole coincide with that of the Sanitary Commissioner as to the impossibility of forming a correct estimate under headings No. 1 and No. 2. Civil surgeon of Rai Bareli suggests, like the Sanitary Commissioner, that the difference in ratio between 1877 and 1878 may be taken as the per-centage due to famine. For this estimate to be of any value it must first be proved that the returns of the year taken for comparison, whether it be 1877 or 1876 are even approximately correct, a point which a reference to the appendix to the Basti report, giving the deaths' report from injuries for 1877 and 1878, must leave in considerable doubt.

All are agreed that the mortuary returns of 1877–78 show a remarkable increase over those of 1876–77, and that every district shows a large increase of male over female deaths and of juvenile and aged people over infants in arms and adults, but no one offers any reasonable explanation of these facts. The civil surgeon of Agra and the collector of Moradabad notice that the birth-rate during the scarcity exceeded the birth-rate of former years. This increase points, I think, to increased zeal in reporting.

The rate of increase due to famine has been rendered less easy of determination on account of the severe epidemics of small-pox and of fever which have prevailed, and have visited rich and poor alike, while unusual cold and rain out of season proved fatal to many who might otherwise have tided over hard times. Many people able to earn wages sufficient to purchase food were unable to purchase a sufficiency of clothing. Insufficiency of clothing probably turned the scale as against the aged and juveniles, adults having more vitality, and infants in arms benefiting from their share in the clothing and body warmth of their mothers.

The excess of male over female deaths may be accounted for by the known dislike of villagers to having their female relatives referred to in any way, and consequently to having their deaths reported. Other theories have been advanced by the civil surgeon of Sahárunpur as to women finding protectors, and by the Assistant Commissioner of Rae Bareli as to women requiring less food than men, which latter seems the most reasonable.

The civil surgeon of Agra draws attention to a feature of the returns which is most deserving of notice. It seems that while in Agra relief works and poorhouses were organised on a large scale, none such were organised in the adjoining districts of Aligarh and Etáwah; yet though the price of grain in these latter districts was but one seer lower than it was in Agra, the mortality was no higher. From this doubts are imported as to whether Governmental relief really lessens the mortality inevitable on high prices, and whether, if zemindars were helped by remissions or suspensions of revenue, and held responsible for feeding those dependent on them, the result would not be at least as satisfactory as the present system. The paragraph is worth attentive consideration.

Capt. Pitcher.

Of the district officers there are only eight or nine who have given us the benefit of their views on these questions, and Jhánsi is the only district which attempts to supply some estimate of the deaths due to famine in past years. The Deputy Commissioner, quoting from the returns for 1868–69, gives 27 per mille in excess of the ordinary rate as the rate due to famine, remarking at the same time that the proportion of deaths due to direct starvation is probably very small. As regards the past season, he observes that the deaths have been yearly increasing since 1875. In Bari Banki the increased death-rate prevailed from November to March, corresponding to the period of intense cold, while after March it fell to the usual rates. The grain rates for Bari Banki have not been supplied, but from those for the adjoining district of Fyzabad I find that wheat sold in September at 12 seers 1 chittack, in October at 11 seers 10½ chittacks, in November at 11 seers 14 chittacks, in December at 11 seers 12 chittacks, in January at 11 seers 1½ chittack, in February at 10 seers 7 chittacks, and in March, when the deaths were greater than in either November or December, at 12 seers 13½ chittacks per rupee. The Lucknow Deputy Commissioner points out that excessive cold, an extraordinary visitation of small-pox, abnormal activity and energy in the matter of reporting deaths, and want, combined to raise the returns.

The Rohilkhand returns exhibit for the winter months of 1878 a very marked increase in bowel complaints. From the collector of Budaun's report it would appear that the peasantry, accustomed in all years to supplement their diet of grain with the young leaf of the grain crop, with a weed called batua, and other green food, took this year, when grain was dear, to eating these weeds, &c. in unwholesome quantities, hence the fatal and great prevalence of bowel complaints.

The Assistant Commissioner of Rae Bareli writes at great length on these questions, giving numerous tables. His conclusions as to age and sex are much the same as those of the Sanitary Commissioner, but I think his estimates of the number of deaths due to famine are rather fanciful. He gives the average for three years of deaths from "all other causes," and then places the excess of 1877–78 over that average as due to direct starvation, leaving no margin for excessive cold or increased activity in registration. This last point is a most important one in framing estimates of mortality. In my replies for Basti I have pointed out that as a rule the deaths from "all other causes," compared for the same month in each year from 1875, increase in each year. The same may be noticed in the returns for Agra, which are appended, and the same may be noted in the Rae Bareli returns drawn out by the Assistant Commissioner. This steady progression in a series of numbers, and the increase shown in the birth-rates during the late scarcity, can be due to improved registration alone.

So also as to fever and small-pox, the increase under those heads is attributed by the Assistant Commissioner to starvation, which is scarcely admissible. As I have elsewhere noted, small-pox increases apparently in virulence as the subsoil water falls. Fever is raging at the present time of writing from Calcutta to Peshawar, affecting places which have and which have not suffered from famine. Grain is no longer at famine prices, yet in Agra thousands have died, rich and poor being alike affected.

The collector of Moradabad is the only officer who has given food-rates in juxtaposition with mortality-rates, a comparison most necessary when the connection has to be traced. The conclusions of that officer may be quoted :—

"It will be observed that the period of the greatest mortality was coincident with the time of the greatest cold, the price of food remaining tolerably constant from September 1877 to March 1878.

There are three districts left, Jaláun, Mirzapur, and Kheri, in which, strange to say, the mortality during the late period of scarcity was considerably less than in the previous year. For Jalaun this is said to be due to extensive emigration; for Mirzapur an unusually severe epidemic of cholera in 1876–77 is made answerable for the difference; while in Kheri it is supposed that, less rain having fallen, fever was not so prevalent as usual.

Figures, however, to support these various suppositions are not given.

Dr. Planck.

I do not think any estimate can be made which shall provide any near approach to the truth as a statement in regard to the proportion which the four causes of death mentioned as prevalent during a time of famine (namely, starvation, privation, hurtful effects of unwholesome food, and disease proper) each bear to the total excessive mortality resulting from famine prevalence.

Indeed, I do not think it can be possible ever to frame such estimate, because in so many cases two or three, or even all four, of the death causes mentioned operate together in the same individual in bringing about a fatal termination to the period of suffering.

II.—No such statistics are in existence as regards past famines in these provinces.

Perhaps a loss of 12 per cent. of the population may be looked for as the result of an extended period of famine prevalent over a wide area of country, the loss being due to all three causes mentioned—excessive mortality, emigration, and decreased birth-rate ; but in what ratio of each I cannot say.

In this province a period of distress approaching to famine has been experienced during, at least, the last six months, January to June 1878, inclusive; and now the escape from famine during the coming year depends entirely upon the sufficiency and favourable distribution of the rainfall of the present season, so far favourably recorded in most portions of the province. Being in the midst of the difficulty, no census operations can yet be possible or useful. But I think the information contained in the mortuary returns of the period mentioned merits attention, though little of accuracy is claimed for the results recorded.

During the year 1876 a total of 937,490 deaths from all causes was recorded in the North-Western Provinces and Oudh, the ratio per 1,000 of population being 21·94.

During 1877 the total was 840,538, the ratio per 1,000 of population being 19·67.

For the six months, January to June of 1878, a total of 836,054 deaths has been recorded, being in the annual ratio of 39·13 per 1,000 of population.

It appears, then, that the mortality of the last six months has been comparatively very great, and to those who have seen much of people during this period there can remain no doubt that much of the excessive mortality recorded has been due to distrest and disease, the result of insufficient nourishmens. I need scarcely say that the mortuary record takes no separate note of deaths resulting from starvation. If provision had been made for such separate record, I believe, as the result of conversation with many police inspectors who immediately control and observe the registration, that many deaths would have been recorded under that head.

At the same time it is necessary to say that all the excess of mortality recorded during the first six months of 1878 has not been due to insufficient nourishment, for there has been during that period a record of unusual mortality from small-pox. It is possible that children who are ill-nourished may be more prone to die from attack of small-pox in years

CHAP. I.
QNS. 24, 25.

NORTH-WESTERN PROVINCES.

Dr. Planck.

of scarcity. But that is quite uncertain, and the excess of deaths from small-pox may with propriety be eliminated from the total excess of mortality recorded, the remainder being taken to represent the mortality resulting from the prevalent distress.

Prepared on this basis, the record presents the following aspect:—

For the first six months of the year 1877 the total mortality recorded in the North-Western Provinces and Oudh was 388,676. In the first six months of 1878 it was 836,054. The difference is 447,378. For the same six months of the year 1877 mentioned the deaths from small-pox recorded were 18,676. For the first months of 1878, 147,584 deaths were recorded from small-pox. The difference is 128,908, which, deducted from the total excess of mortality, leaves 318,470 deaths attributable to the abnormal conditions resulting from famine prevalence.

In regard to the portion of the population which has most suffered, the records of age at death throw some light.

Thus for the two years 1876 and 1877 the average age at death was thus recorded:—

Ages at Death recorded in 1876 *and* 1877.

Year.	Infants less than one Year.	Boys and girls from 1 to 14 Years.	Adults 14 to 40.	Old Persons above 40.	Total.
1876 - -	228,798	210,231	232,514	265,947	937,490
1877 - -	234,157	194,439	180,287	231,651	840,538
Average -	231,482	202,335	206,400	248,799	889,014

For the first six months of 1878 the age at death has been thus recorded:—

Age at Death recorded in first six Months of 1878.

Infants.	Boys and Girls.	Adults.	Old persons.	Total.
206,219	222,205	153,927	253,703	836,054

Taking the average of the two years 1876 and 1877 to fairly represent the normal ratio which the different ages at death bear to the total mortality, by comparing the figures of the two tables a very considerable departure from the normal ratio is noticeable in regard to the ages at death for the first six months of 1878, and this will be more clearly and immediately apparent by a statement of proportions.

Thus, the normal ratios provide the following proportion of ages in every 1,000 deaths:—

Infants 261, children 228, adults 232, old persons 279.

Whilst for the six months of 1878 every 1,000 deaths are thus apportioned: infants 246, children 266, adults 184, old persons 304. Placed side by side the figures have this appearance:—

Age at Death.	Proportion to 1,000.	
	Normal.	First six Months of 1878.
Infants - - - - -	261	246
Children - - - -	228	266
Adults - - - -	232	184
Old persons - - - -	279	304

And it may be seen that the increased mortality has been borne in greatest measure by the children and old persons.

BENGAL.

BENGAL.

Mr. Toynbee.

There are no records or reports from which any estimate can be made of the number and proportion of deaths which are the inevitable consequence of famine, but which are not due directly to starvation, but to such privations as adults in health can bear with safety, but which prove fatal to children or the old and sickly; or to such diseases as follow in the train of famine from eating unwholesome food, roots, berries, leaves, &c.; or which arise from other and obscure causes, like cholera and fever, commonly concomitant on famine. Such statistics as exist showing the depopulation past famines have caused in this province are given on page ; but as no special census was taken either after the famine of 1866 or after that of 1874, no accurate replies can be given to the remaining portion of question No. 24.

Although registration in Bengal was in its infancy in the first five years of the present decade, a certain amount of information can be obtained from the mortuary returns for the famine year 1874. The deductions to be drawn from these returns are supported by the statements made in the Sanitary Commissioner's annual reports for 1874, and in the annual sanitary reports for 1874 from several districts where extensive relief operations were undertaken. In the statement alluded to a summary is given of the ratios of deaths per 1,000 of population in the worst famine districts of 1874 from cholera, small-pox, fevers, bowel complaints, and other causes for the three years 1873, 1874, and 1875. It will be seen that the grand total of deaths from all causes in Behar and Northern Bengal was 6·43 per 1,000 in 1874 against 7·33 in 1873 and 8·13 in 1875. The year 1873 was one of the early years of registration, and probably a very small proportion of the actual deaths occurring were registered. It is presumable that in 1874, owing to the large staff of officers scattered throughout the districts supervising famine relief, registration of deaths was better effected than in the preceding year. Taking the individual headings, we find that in Behar the death-rate from cholera in the famine year 1874 was only 0·26 against 122 in 1873 and 1·06 in 1875; in Northern Bengal the death-rate was 1·10 in 1874 against 0·57 in 1873 and 1·61 in 1875, the total for the whole of the famine districts being 0·49 in 1874 against 1·04 in 1873 and 1·21 in 1875. With regard to small-pox the two years 1873 and 1874 showed nearly the same ratio of mortality, while 1875 was a year of general low death-rate from the disease. Again the death-rate from fevers in 1874 in nearly every famine district was less than that of 1873, the grand total for all the famine districts being respectively 4·57 in 1873, 4·27 in 1874, and 5·32 in 1875. From bowel complaints the ratio of deaths in Behar was less in 1874 than in 1873 or 1875, and only slightly greater in Northern Bengal. As bearing generally on the subjects raised in questions 24 and 25, the following observations by Dr. Coates relating to the famine districts visited by him, as recorded in the annual report of 1874, are reproduced:—

"A short abstract of the observations noted in my former and latter tours through the famine districts is as follows:

"In the former, begun in May, Burdwan, Tirhoot, Chumpárun, North Bhagulpore, Purneah, Julpigoree,

CHAP. I.
QNS. 24, 25.

BENGAL.

Mr. Toynbee

Rungpore, Dinagepore, and Maldah were visited; in the latter, starting in August, Hooghly, Burdwan, Moorshedabad, Rajshahye, Bhagulpore, Monghyr, Tirhoot, Chumpárun, and Chuprah were gone through.

"In the first I found Ramnuggur in North Chumpárun, Madhubunni in North Tirhoot, and North Bhagulpore, and North Purneah to be the worst districts as regards disease and condition of the people. Here there were extra bowel diseases, dropsies, sloughing ulcers, the presence of pregnant women in the hospitals, and orphans or deserted children in the poor-houses; in all the other districts the people were largely anæmic, and more emaciation also prevailed. In the former, particularly Madhubunni and North Bhagulpore, the able-bodied men had in the cold weather gone away to seek labour and food. I was told they chiefly crossed the Ganges to the Monghyr side to obtain work in cutting the rabi crops there; they thus left the women, the old, the feeble, the young, and the diseased at home. The stronger of these crowded our relief works; the others remained in their homes or sought food in poor-houses. These places were farthest away from large towns and main roads; they were thus more isolated and difficult of access, and hence it was, I believe, that their previous want affected them so much and so long. In these out-of-the-way villages I found 50 to 75 per cent. of the people anæmic and emaciated; nearer to large towns and main roads there were 15 to 25 per cent. so affected, while in the sudder stations these were under 10 per cent. The planters, zamindars, and villagers were loud and unanimous in their opinion of the necessity there was for the free distribution of rice to the people. They told me that, before the golas were opened, the people had begun to collect together to call on those zamindars who they supposed had rice in store, begging for food; and threatening that, if it was not distributed, they would burn the stores in question. Messrs. Tripe and Gibbon, of North Tirhoot and Chumparun, stated that these fires had begun, and that they quite ceased as soon as the Government golas were opened. Except a few accidental village-hut fires, none were afterwards heard of. That pregnant women, unable to work for their food at our tank, road, and bund-making works, and unable to get food any other way, were forced into our poor-houses, particularly in the Ramnuggur and Madhubunni circles, there to await their confinement and remain till fit for work again; and that orphans or deserted children should have sought refuge and sustenance in our hospitals, proved how real was the scarcity, how closely relief pressed on it, and how necessary it was that preparations for a large sickness and mortality should be rapidly completed. The people of Belsund, Bongong, and Pooprее, and the planters there, told me that but for the measures adopted by Government a greater mortality than that of 1866 would certainly have occurred this year among the people. They said that cholera and dysentery followed on the people eating bad and insufficient food, and that during the five months that ensued on the failure of the rabi crop that year at least three out of four in every village there died; some of the villages were entirely deserted, and many of the dead remained unburied. This fact and the presence, in this northern tract, from Ramnuggur to Purneah, of sloughing ulcers, dropsies, and extra bowel diseases, made us run up a double set of hospitals in every circle—one for ordinary, and one for contagious, diseases. The medical department pushed in an ample supply of medicines, which were divided into three—one lot to be massed in the head-quarters stations, one to be sent to out-circles, and a third to be carried about by native doctors from village to village. Native doctors were obtained abundantly from all parts, Madras on the one side to Punjab on the other, and distributed where the need was greatest. Six extra English surgeons, too, were specially deputed to the subdivisions or districts where pressure was greatest. The insanitary state of relief centres and great works of towns and villages was pointed out, and remedied as fast as possible. Here I must revert to the outlying villages to which there were no roads, only field paths interrupted by streams and nullahs, and therefore difficult of access; in these were left the old, the feeble, and the diseased. Here it was that the plan of sending the food direct across country, and distributing it in every village where want or suffering showed itself, met an urgent difficulty, and prevented an amount of disease and death that must have been very great and would probably have been little heard of. It was in these villages, deserted by the able-bodied, that I found as far as 75 per cent. underfed, and that the food distribution was most important and most beneficial. It was here that the native doctors did most good; they went from house to house, treating the sufferers in their own homes, and when cholera or small-pox showed itself the surgeon of the district or subdivision was soon on the spot; extra native doctors were quickly at work, and each case was separately treated and stopped on the spot where it arose. Cholera broke out in every one of the distressed districts, yet in no instance did it become a general epidemic. Wholesome food and prompt treatment prevented its spread. The Royal College of Surgeons at home, anticipating as large an amount of sickness and mortality as in previous famines, desired a special deputation of scientific medical officers to investigate the condition of the people and the extraordinary sickness and mortality ensuing on the scarcity. A circular, suggested by the Sanitary Commissioner with the Government of India, was sent to every civil surgeon in Bengal, calling for a weekly report on the health of the people, that, in the event of extraordinary disease appearing, he and Dr. Lewis or Dr. Cunningham might at once visit, examine, and report on whatever disease or condition prevailed. No such investigation turned out necessary; the civil surgeons made but one report all the season through, which may be thus epitomised:—'No scarcity unrelieved, therefore no extraordinary 'sickness. Cholera in sporadic form mastered in its 'own homes. No deaths from starvation. Health 'of the people improving or better than usual.' The deputation, therefore, never came. In the visit to the districts previously noted and now just completed, I found no pregnant women in an hospital or poor-house in the places where they had been previously; where sloughing ulcers had been, now those that remained were healing; no one was gangrenous. These are proverbially slow of recovery. Fevers, cholera, dropsies, and bowel diseases had decreased to an unusually small number in every district, but, more extraordinary still, the endemic fever that had for years past broken out every August in Burdwan, Hooghly, and Bankoora is so far entirely absent. Though enfeebled by previous disease, not only was want, but also special disease, prevented by the timely and free distribution of food, fortifying and protecting the recipients against the malaria from which they in previous years succumbed so largely. Our many extra hospitals have been little used. Had we had the usual amount of rainfall in July, August, and September, and had the diseased and emaciated not been fed and treated in their own village homes, but been allowed to crowd into our central hospitals, no matter how much and how carefully these had been organised and attended to, an enormous increase of disease and largely fatal results must have ensued. In my last round through the worst, or what had been the worst, parts of Tirhoot and Chumpárun, I found the people averaging six per cent. anæmic, and in the centre stations four per cent.—a condition which I consider is better than their usual health. It must be admitted that the gangs of the poorest had then been broken up, and the worst cases had separated each to his own village. The planters and people acknowledge, however, that they could not remember a year when the villagers had been so healthy and

Chap. I.
Qns. 24, 25.

Bengal.

Mr. Toynbee.

when sickness and mortality had been so little, and attributed it to the full and perfect arrangements for feeding the poor and those wanting food. Cattle disease, too, was unusually absent. The people of Dinagepore and Rungpore, feeling the scarcity last cold weather, had sold about half their cattle at half the usual prices to men who come for this purpose from the districts further eastward, expecting large numbers at cheaper rates. In these districts the cattle were healthy. In Tirhoot, where the bullocks were hard worked, massed together, and exposed to all weathers, small-pox or gooti did break out, particularly about Poosah; those that died were buried, the rest were isolated and recovered. The mortality was inconsiderable. There is thus abundant evidence to show that the famine year of 1874 in Behar and Northern Bengal was a year of smaller mortality than usual and of improved general public health."

Statement showing the Mortality of 1874 compared with that of 1873 and 1875.

Note.—During the famine of 1874 the following deaths were reported, and after inquiry ascertained to be due to actual starvation: viz., in Tirhoot 15; in Monghyr 2; in Bhagulpore 5; total 22.

Central Provinces.

Dr. Barter.

CENTRAL PROVINCES.

Births in the Central provinces are recorded at an average of 6·30 per mille of population per annum in excess of deaths for the 10 years 1868–77, the aggregate excess being 495,940. In 1869 only did the deaths exceed births. The aggregate excess was 75,405 in that year, and the ratio per 1,000 of population was 15·5 in excess of births; in that year there was famine, which was felt most severely in the Jubbulpore and Chhattisgarh divisions.

Registration of vital statistics during 1868 and previous years was not perfect; the following figures are, however, extracted from the Sanitary Commissioner's report:—

Deaths in the Central provinces in 1868 being returned at 16·50 per 1,000 of population, the following districts showed highest:—

Jubbulpore	29·0
Chhindwara	26·4
Bhandara	25·0
Seoni	22·9
Nagpur	21·2
Saugor	22·2
Bilaspur	17·7
Raipur	10·2

Mortality falling in 1869, per 1,000 of male and female population, at 35·9 in the provinces, the following are the highest district figures:—

	Male. Female. Total.
Jubbulpore	*38·1+25·0=6·31*
Damoh	*33·9+26·8=60·7*
Saugor	*31·3+24·7=56·0*
Bhandara	*23·8+2·09=44·7*
Bilaspur	*22·3+17·4=39·7*
Raipur	*20·6+16·0=36·6*

and in 1870 the totals fell to the following:—

Jubbulpore	23·5	Bilaspur	9·7
Damoh	21·2	Raipur	12·7
Saugor	21·0	Murwara	10·3
Bhandara	8·0		

CHAP. I.
QNS. 24, 2

CENTRAL
PROVINCES.

Dr. Barter.

The ratio for towns for 1868 is not given; that for 1869 is here extracted:—

Jubbulpore	Jubbulpore district.	123·3
Panargarh		101·3
Sehora		87·7
Garha		71·5
Mandla		102·8
Garhakota (Saugor)		90·7
Gadarwara (Narsinghpur)		82·1
Damoh		78·4
Bilaspur	Bilaspur district.	76·7
Ratanpur		62·6
Raipur		73·2

To cholera was due the heavy mortality in Seoni, Jubbulpore, and Mandla in 1868; 42, 27, and 27 being the ratios of cholera deaths per cent. of deaths from all causes; and to this disease and to small-pox, to fevers, bowel complaints, and to famine was due the heavy mortality in 1869*, which exceeded that of 1868 by nearly 100,000 souls.

The Sanitary Commissioner's statistics do not give deaths the result of famine separately; the following figures show to what mortality was due during the years 1868, 1869, and 1870:—

	1868.	1869.	1870.
Cholera	7,952	51,387	107
Small-pox	2,843	16,849	2,348
Fever	47,160	68,999	81,244
Bowel complaints	5,175	12,550	14,497
Other diseases	13,928	23,488	13,407

The rise from 13,928 in 1868 from "other diseases" to 23,488 in 1869, and the fall to 13,407 in 1870, would point to famine as the cause of the increase in 1869, but to what precise extent famine raised the mortality in 1869 I am unable to say; these diseases follow in the wake of famine or want.

Failure of crops was complete in some places and partial in others; the north-east part of the Raipur district suffered most, and the eastern part of Bilaspur. Relief works were started early. Accustomed to abundance of food, obtained by light labour, the people could not be induced to go 40 or 50 miles to work; they preferred semi-starvation on berries and other jungle produce to fair labour at a distance from their homes, and works had to be designed on the score of accessibility to the suffering classes.

Cholera broke out in these gangs in May, and committed great havoc. The return for the two districts show a mortality of 18,569.

The northern districts suffered from an influx of starving people from adjoining native states. Saugor, Damoh, and Jubbulpore were the districts chiefly concerned. In Murwara, the northern subdivision of Jubbulpore, failure of the crops was complete, and followed two bad years. As relief operations were taken in hand early, to this point flocked the starving from Rewah, Nagode, and Punna. The condition in which many of these emigrants arrived was very bad; reduced to the lowest state of exhaustion, many survived only a few hours, whilst others were unfit for work until after a protracted convalescence.

A table (B) is here given showing deaths in Saugor Damoh, and Jubbulpore, also in Raipur and Bilaspur in 1868–69 and 1870. This shows that the Jubbulpore district suffered most from the diseases more closely relating to famine, as bowel diseases and those undefined and grouped under "other causes." The losses from these two diseases were as follows in the three years:—

B.

Deaths.	Saugor.			Damoh.			Jubbulpore.			Raipur.			Bilaspur.		
	1868.	1869.	1870.	1868.	1869.	1870.	1868.	1869.	1870.	1868.	1869.	1870.	1868.	1869.	1870.
Cholera	256	9,295	—	—	2,285	—	2,940	3,796	25	3	9,349	—	4	9,220	—
Small-pox	238	5,434	1	63	2,014	9	398	2,372	59	123	400	273	193	495	66
Fever	5,901	8,605	7,759	1,474	2,441	1,714	2,831	16,791	6,447	4,438	9,894	9,023	8,641	10,060	4,000
Bowel complaints	717	1,012	848	229	810	854	767	4,918	2,007	391	776	476	124	375	278
Other causes	2,731	2,924	1,491	573	1,406	874	3,691	8,684	1,377	813	912	713	77	776	89
	9,843	27,270	10,099	2,373	9,492	3,461	10,627	26,561	9,915	5,768	21,331	10,185	9,039	20,926	4,433

1868.	1869.	1870.
4,458	13,602	3,348

thus 10,000 in round numbers perished in excess of the deaths of a normal year from these two causes; the figures for the other districts mentioned are not so marked; those for the Saugor are—

1868.	1869.	1870.
3,448	3,936	2,339

and those for Raipur give no clue to the real mortality that took place there as the result of famine. Since that date the registration of vital statistics has been vastly improved.

Mortality due to privation.—The statistics at my disposal do not enable me to form any estimate of the deaths due to privation, as affecting "children or the old and sickly," but the figures I have just given, vide answer given at pages 96–98, show that about 10,000 in round numbers died in 1869 from diseases which are classed under the general heading "other diseases" in excess of the mortality of a normal year. It is probable that a large number of these deaths were due either directly to famine or to such diseases as follow in its train from eating unwholesome food. The deaths arising from diseases concomitant on famine, as fevers, cholera, &c., for the whole provinces are given in the foregoing answers under group 2. The total mortality for the provinces for 1869 is stated by the Sanitary Commissioner to be nearly 100,000 in excess of that for 1868, and the returns show that it was about 60,000 in excess of the mortality recorded in 1870.

Depopulation caused by past famines.—I have in my answers under group 2 given increased death-rates during the famine years. I have no statistics to show the extent to which emigration was resorted to; and the fluctuations in births and deaths for the 10 years 1868–1877 I give in the table annexed; this shows that there was a decrease of 7,606 births in 1869 with reference to 1868; that in the following year 30,112 children were born in excess of 1869; and that each of the following two years, 1871 and 1872, showed a still further increase in the births of 75,000. These are aggregate figures, but the averages in column 7 of the table bring the matter out more clearly; thus in 1869 deaths per 1,000 of population exceeded births by 15·5, due to a low birth and a high death rate; in 1870 the birth-rate had not recovered itself, and the excess of births over deaths fell at 2·20 per 1,000 of population.

				495,940 = 6·30 births per 1,000 of population in excess of deaths for the 10 years.				

BOMBAY.

Dr. Hewlett.

BOMBAY.

No accurate estimate can be made, in my opinion, of the number and proportion of deaths which are the inevitable consequence of famine, not being directly due to starvation but to privation or disease. Our system of registration of deaths is in its infancy, and is of course most inaccurate in every respect. The deaths are, by order of the Government of India, classed under one of the following six headings—cholera, small-pox, fevers, bowel complaints, injuries, all other causes. The registrars are too often ill-educated men, who possess no medical knowledge whatever. They are generally the kulkarnis (village, accountants), who do not reside in the village, but who periodically visit a given number of villages, and are informed by the patel, who oftentimes can neither read nor write, of the number of deaths that have taken place since the last visit of the kulkarni. With such an organisation, it, of course, happens that many deaths escape registry altogether, and that the causes of death are extremely inaccurate. I believe, however, that the causes of death under the headings cholera and small-pox are, with some margin, pretty correct. The rapidity with which death follows the attack in the one case and the symptoms in the other are so distinctive that, in my opinion, comparatively speaking, many mistakes do not occur. The returns under the heading "injuries" also may be accepted as comparatively speaking correct, but the returns under the heading "fever" are absolutely incorrect. Any disease accompanied by increased heat of body is classed under the generic name of *tap*, and deaths from pneumonia, pleurisy, and other inflammations appear under this heading. Under the heading "all other causes" would be included deaths from starvation and from anæmia, the result of long-continued privation.

MADRAS.

Dr. Cornish.

MADRAS.

This question, in regard to its first clause, cannot be clearly answered. An attempt was made by the Orissa Famine Commission to obtain the mortality under two heads: 1st, deaths directly due to famine; 2nd, deaths indirectly due to famine; but the failure was complete.

The registered causes of death are not in any degree trustworthy; but this much is certain, that in the famine areas the people died (in round numbers) in three times the proportion they did in non-famine districts during the year 1877. I have shown in my annual report for 1877, and illustrated by diagrams, that there was a very close correspondence between prices of food and mortality in the famine area; and as excessive mortality was confined to the famine area, or districts bordering thereon to which people fled for help, there can be no reasonable doubt that the excess mortality was famine mortality, and nothing else.

The use of the term "starvation" in this question is not clear. There are two distinct forms of starvation recognised by all authorities—"acute starvation," where persons are deprived for a time of all nutriment whatever; "chronic starvation," in which the daily food is insufficient in quantity or quality for the repair of the daily waste of the body. Acute starvation is a diseased condition admitting of relief if the victims are seen in time and judiciously treated. "Chronic starvation" which has continued so long as to cause severe bodily wasting is practically beyond remedy. It is the latter form of starvation that famine administrations have to deal with. Owing to a want of precision in description, non-professional persons have generally confused the results of the two forms of starvation. They have noticed that coal miners shut up in the works or shipwrecked mariners have recovered after being totally deprived of food for several days, and it has apparently been surmised that partial rations of food continued for weeks and months could be borne by the famine-stricken with impunity. History and physiological

CHAP. I.
QNS. 24, 2

MADRAS.

Dr. Cornis

science give no warrant for such an opinion. In applying the term "starvation" in connection with famine, "chronic starvation" is always implied. This form of the disease is so much the worse than acute starvation that in the one case food judiciously given will restore health and strength, while in the advanced forms of the other the most costly of nutritious dainties are powerless to restore vitality. I have commented elsewhere on the want of precision in the use of the term "starvation."

I am not aware of any experience showing that adults in health can bear privation "with impunity" which proves fatal to children or the old and sickly. My personal experience went to show that in the early period of the distress the earliest victims were the old and the young of the labouring people. But, as these classes are not bread-winners, the probabilities are that they were the first to be stinted in their daily food. As the distress increased, and the food became more difficult to procure, the adult men and women broke down just in proportion to the degree of privation to which they had been exposed. All that can be safely stated in regard to the superior endurance of adults is, that, having a greater stock of vitality than the old, they necessarily can hold out for a somewhat longer period under an equal amount of privation; but our jail experience altogether opposes the notion that, even as regards these classes, they can bear "chronic starvation" for prolonged periods with impunity. At page 81 of my report of 1877 is given a table showing the mortality of the general population according to age, and it will be seen that the proportion of mortality of children from one to six years had increased from 29 per mille in 1876 to 58 in 1877; of children from six to 12 years, from 11 per mille in 1876 to 32 per mille in 1877; of adults from 12 to 50 years from 16 per mille in 1866 to 40 per mille in 1877; and of old people above 50 years from 67 per mille in 1876 to 166 per mille in 1877. Of all these classes of the population the proportion of increased mortality was lowest in children under six years of age. This, I suspect, was owing to the decreased population of young children from diminished births.

This clause of the question assumes as a fact that adults can bear a greater degree of privation than the old and young, but the experience of the famine and an analysis of the proportions of the populations returned as dying at various ages in 1877 does not entirely bear out the assumption.

In my opinion, it is only fair to debit all excess of mortality in famine areas beyond the ascertained mean of ordinary years to famine either as directly or indirectly connected with failure of food supplies. It is quite impossible to draw any line, and say, "This is a famine death, pure and simple," and of another, "This is a death indirectly due to the famine." Famine brings about so many abnormal conditions, *e.g.*, bad water, bad housing and clothing, promiscuous herding of the people on works, and exposure to communicable disease, that no one, however desirous of arriving at the truth, could satisfactorily classify the mortality in the way suggested. Thousands of persons, for instance, on relief works, fell victims to cholera, small-pox, and fevers who, if they had remained in their own villages and in their own occupations, with an adequate allowance of food, would probably have been alive to this day. Famine means agglomeration of the population under peculiar insanitary conditions as well as dearth of food.

MYSORE.

MYSORE

Colonel Peo

Their usual food grain is ragi; rice in ordinary times is never eaten by the Canarese-speaking people of this division, excepting in very small quantities. In fact, the poorer classes among the Canarese population of Mysore say unhesitatingly that rice does not agree with them. Now during this famine, and when it was just culminating to its severest time, the food of the poorer classes of the population, in consequence of the dearness and scarcity of ragi, was changed in about the space of one month to rice almost exclusively. In ordinary times I believe it will be admitted that such a change would have affected the health of the people very seriously, and therefore at a time when half the population were living on scanty fare, supplemented by all kinds of unwholesome food, the sudden change in their staple diet must have had the most injurious effect on them. The complaint, even among well-to-do people, was that the imported rice, which was of very inferior quality and dirty, brought on diarrhœa; and therefore it is more than probable that the fearful mortality of May, June, and July 1877 was due to this unavoidable change of diet, acting upon people debilitated and reduced by scanty and unwholesome food.

CHAPTER I.—QUESTION 26.

It has been laid down by the Government of India as a settled principle that local financial responsibility should be enforced in the case of a famine as far as possible. With this view special taxation has recently been imposed on the country, the proceeds of which the Government has proposed to apply as a mutual assurance fund which will be available for the benefit of the people on whom the calamity of famine may actually fall. But it has been recognised that it would be preferable if some portion of this taxation could be made more strictly local, both in its levy and its application to relief purposes. Can you suggest any way by which it might be rendered practicable to provide that where State funds have been expended on the relief of famine, such expenditure should be recovered from the locality which has benefited by it under any system of (taxation in modification of or in substitution for that recently adopted and not in addition to it) in a manner that should bring into operation a sense of local responsibility, first in the direction of securing the lives of the people, and second of protecting them from unnecessary expenditure on relief? How could such a principle be applied to a smaller area than that of a province or presidency? Could the expenditure in a single district, or sub-division of a district, be recovered from that district or sub-division by such special taxation wholly or in part, or under any special circumstances, or in reference to any class of the community requiring relief, leaving a smaller or larger portion of the charge to be made good from the province or presidency at large, or from the resources of the Government of India? Could any plan be suggested under which, subject to similar limitations, a municipality might be required to bear the cost of feeding its own poor? What kind of special local taxation should be adopted for this purpose? What would be the probable effect (1) on the minds of the people, (2) on the temper of the officials, of the knowledge that the cost of famine relief expended on their behalf or by them would have to be recouped by local taxation? Is there any reason to suppose that the sense of local responsibility, if it could be brought to bear, would not operate beneficially in the case of relief of the distressed portion of the population in India?

PUNJAB.

Lieutenant-Governor.

2. This question, accepting the principle which has been laid down by the Government of India as settled, that local financial responsibility should be enforced in the case of famine as far as possible, is whether it be practicable to provide that, where State funds have been expended on the relief of famine, such expenditure should be recovered from the locality which has benefited by it, under any system of taxation (in modification of or in substitution for that recently adopted, and not in addition to it), in a manner that should bring into operation a sense of local responsibility.

3. I am to observe that any opinion given in reply to this question must, from the nature of the case, be theoretical; as the taxation imposed as an insurance to meet famine expenses has been imposed, and is collected, as a part of the general taxation of the country, and may be used on emergency for general purposes, in accordance with the declaration in the speech of the Financial Member of Council, of the 9th February 1878, quoted at paragraph 283 of Financial Department Resolution, No. 1249, of the 13th March last.

4. The question further states that it has been recognised that it would be preferable if some portion of this special famine taxation should be made more strictly local, both in its levy and in its application to relief purposes. But the Lieutenant Governor holds that, in its levy, it is impossible that it should be more local than it is at present: the enhanced land rates, and the License Tax of 1878, are distinctly local; they include in their operation all those who contribute towards Government land revenue, and the trading and artisan classes. There is scarcely anyone able to pay at all, with the exception of the official classes, who is exempted from them, and it is clearly impossible to make any taxation which is collected in anticipation, by way of insurance against famine, more local in its collection than these taxes are. In its application, the proceeds of this special taxation may, it is true, be made more local; but, with regard to the establishment of a separate fund, the policy of the Government of India has been authoritatively declared in paragraph 283 of the Financial Department resolution before quoted. It was there held impracticable to form a separate fund from the produce of the new taxes, by law set apart strictly from the general revenues, and only to be applied to specified purposes; seeing that if any sudden change of circumstances arose, calling for seriously increased expenditure or causing a considerable falling off in the revenue, the Government would have to choose between the imposition of fresh taxes and the abrogation of the law constituting the fund.

5. Such being the declared policy of the Government of India, and questions of Imperial taxation and the expediency of particular methods of raising a required revenue being beyond the scope of the labours of a famine Commission, whose discussions, where the policy of Government has been distinctly declared, can have little more than a speculative interest, the Lieutenant Governor is not prepared to suggest, as he would otherwise have been disposed to do, the formation of a provincial famine fund from the proceeds of special taxation. From the provincial or district point of view, this would be, no doubt, an advantage; but it would bind the hands of the Government of India in a manner in which they have declared that they will not be bound. Yet, from the local standpoint from which the Famine Commission have apparently viewed the subject, and in answer to the question asked, his Honour has little doubt that it would be advantageous to invest, year by year, the proceeds of special famine taxation of each district in interest-bearing securities, drawing upon them, as occasion required, for the relief of extraordinary distress, or of famine when it occurred. A certain contribution, which might be 20 or 25 per cent., should be withdrawn each year from the receipts of all districts into the common fund for the construction of works protective against famine, such as canals, roads, or railways, designed and carried out under the orders of the Local Government, after having, if necessary, obtained the sanction of the Imperial Government.

6. The proper proportion would be credited to municipal or district committees, equivalent to the amount of special taxation imposed upon them; and the employment of the fund on ordinary famine works, or on the relief of extraordinary distress, should be left to the district and municipal committees. In this way alone does the Lieutenant Governor anticipate that the taxpayers would have confidence that the money collected by taxation for the relief of famine was really applied to that object.

7. With reference to that part of the question which inquires whether famine expenditure should be recovered from the district in which it has been incurred, I am to observe that the Lieutenant-Governor is

CHAP. I. QN. 2

PUNJAB.

The Lieutenant Governor.

opposed to any specially local taxation, as unsuited to the habits of the people, and as likely to increase selfish exclusiveness. The application of such a plan would, moreover, cause considerable interference by Government officials, which would be exceedingly distasteful to the people. It is impossible without a poor law and a law of settlement to localise famine taxation and relief on anything like a parochial or union system, as suggested by the Famine Commission; while any approach to a parochial system must tend to check the stream of private charity Hitherto, and until the system of State interference dislocates the habits of the community, the Indian custom has been, and will be, for each town or village to support its own poor; while professional and religious mendicants are supported by the common charity. This system necessarily breaks down in the presence of a true famine; but all measures of relief, under such circumstances, must collapse without the direct interference of the Imperial Government, drawing famine funds from the general treasury, or from the surplus resources of such provinces as are unaffected by famine. The proposal to localise insurance funds would virtually amount to the creation of a poor law, and their distribution would have to be confined by strict rules to those times only when distress, in the opinion of the Local Government, had become so intense as to be too severe a strain on private resources. It would be in every way undesirable to discourage private charity, which is in India as large and conspicuous as in any country in the world.

8. These remarks cover the question whether any plan should be suggested under which, subject to certain limitations, a municipality might be required to bear the cost of feeding its own poor. In ordinary times the municipality does feed its own poor; and in times of great distress, such as have recently affected the Punjab, the municipalities are bound—and Amritsar, Sialkot, and Rawalpindi have fully admitted the obligation within the last few months—to spend the whole of their surplus municipal revenues in the support, not only of permanent residents of the towns, but of strangers temporarily residing within their limits.

9. The Lieutenant Governor does not think that when a famine is over districts can be specially taxed to recoup Government for any extraordinary expenditure. In the first place, and supposing no change to be made in the imposition and incidence of the special taxation which has now been imposed, the money spent will not have been expended by Government at all, but will have been contributed by the people themselves for the very objects to which it has been devoted. But, even supposing that the proceeds of this special taxation have been exhausted; and that the Provincial Government is compelled to contribute to famine relief more than has been raised in the district, or that the Imperial Government has been compelled to grant more than has been raised by famine taxation in the Province, the Lieutenant Governor still does not think that, after the cessation of famine, any additional or special taxation should be imposed to recoup the Provincial or Imperial Government for the excess expenditure. Should the Supreme Government at any time determine, as it resolved and declared in the Madras famine, though unfortunately in vain, that, whatever the distress, no life should be lost by famine, and undertake measures which are far beyond the power and resources of local committees or the Provincial Government, it must itself provide the necessary funds, without hope of repayment. Nor, if the calculation of the amount required annually for famine insurance be correct, would it be necessary to ask to be recouped, as the surplus collections of one part of India would be set against the excess charges in another. To specially tax a district to recoup Government for exceptional expenditure is, in the opinion of the Lieutenant-Governor, the exact reverse of what the policy of Government should be. It would only have the effect of sinking the population further into debt, difficulty, and bankruptcy; each year they would be more impoverished, and more unable to meet the next scarcity, which would again increase their liabilities and burdens. It would, in his Honour's opinion, be far a wiser policy for the Government, after the occurrence of a famine, to remit in a particular district, rather than increase, the revenue demand, thus allowing the people to regain their elasticity and recover from their misfortunes.

BENGAL.

BENGAL.

Mr. Toynbee

Famine Finance.—None of the officers consulted have been able to propose any feasible scheme under which famine expenditure, provided in the first instance from State funds, should be recovered from the localities benefited in such a manner as to create a sense of local responsibility. If famines were due solely to causes under the control of those who suffer from them, there would probably be little difficulty in the matter. But to tax a particular district or particular tracts of country because the soil in them is drier, or because the rains of heaven are more frequently withheld from them than from other districts or tracts, is, on the face of it, unjust in the extreme. Over-population and improvident habits are certainly causes of the aggravation of the effects of a famine occasioned by drought, but they are hardly grounds for taxation or for legislative interference, unless indeed nature's laws are to be superseded and a system of State relief and poor laws substituted. The principle of such a system of local taxation would be to fix the burden on the shoulders of those least able to bear it, and it would tend to demoralise the people by making them look more than ever to Government for aid. If each district were a unit complete in itself and quite independent of other districts, the principle would not be so difficult of application. But in Bengal hardly any two districts, indeed hardly any two pergunnahs of any one district, are exactly similar in physical and economic conditions. Each would have to be treated on a separate principle to avoid inequality in incidence. The localities which benefit from famine expenditure are not solely those in which famine exists. The more fortunate and prosperous districts make a large profit by selling them their surplus stores. Why should they not bear their share of the famine taxation? Even granting that a district subject to famine should in theory be made to bear the expenses of that famine, how is the taxation, when imposed, to be realised? It is not the trader alone who is benefited; but is he to be the only person to pay? Landlords have to wait for their rents until better times come. Beyond the system of provincial taxation now in force in Bengal it seems impossible to go. In the road cess and public works cess the land already contributes its share of famine expenditure. The road cess funds are purely local in their application. When scarcity comes, work is given, at first, from them only. If scarcity ripens into famine, large works are opened under Public Works Departmental supervision. The former provide for those unable to do a full day's work; the latter for strong and professional coolies. The one class of work benefits the district in particular, the other the province at large as well. The profits of the trading classes are already tapped by the license tax. There would be no difficulty in setting aside a portion of any of these three funds for expenditure in the districts in which there was famine. But there is not a district officer in the province who would willingly incur the odium or responsibility of introducing anything beyond this in the way of direct taxation. It must never be forgotten that new modes of taxation are almost as disagreeable to the people as new taxes themselves. To modify a tax even is to unsettle the minds of the people, unless the modifica-

HAP.I.QN.26.

BENGAL.

r. Toynbee.

tion be in the way of reduction. If, then, it be impracticable to make the district the unit of taxation-decentralisation, how much more so would it be to make the municipality? The municipalities in Bengal already pay quite as high taxes as they are able to bear without more than outward grumbling. In times of distress the poor flock to these towns, where the richest natives live, and are fed and maintained by them. The share they pay of the license tax is, of course, far greater than that paid by the rest of the district; and so they already bear their full share of the burden. It would be impossible to make a municipality provide for more than its own poor; but how would it be possible to prevent the usual influx of poor from the interior and from smaller towns? There is no doubt that there would be this further effect of any system of purely local famine taxation, that it would at once entirely dry up the springs of private charity. We must then come to a vast system of State relief founded on a comprehensive poor law. Where is the district officer, his hands already full enough of work and anxieties, who could contemplate such a prospect without a shudder? The sense of local responsibility, as far as he is concerned, is quite strong enough already; and no system of local taxation, such as that suggested, could ever affect a district officer's sense of his duty to save life and to prevent unnecessary expenditure. The individuality of no human being can be touched by a system of taxation, which cannot make him otherwise than he is. On the head of the district administration alone would it depend, in reality, whether the expenditure of funds, however raised, was lavish or parsimonious, or whether the golden mean was hit off.

All the officers consulted are generally agreed as to the general principles enunciated above, and there is no doubt that such a scheme as that indicated in the committee's 26th question would be received with disfavour and heartburning by governors and governed throughout the whole length and breadth of the land. It is hardly necessary to mention some of the alternative suggestions that have been made. One officer would resuscitate the old village communities and give landlords the power of compulsory labour, would tax tobacco, seals, ferries, and markets, and would have a committee on lands left for charitable purposes. Another would store grain on behalf of Government, tax stallions, and revive the income tax. Such proposals are hardly worth serious consideration, and are beyond the points mooted by the question.

Any attempt at further increasing the taxation of the country would be attended with the most mischievous results. The present taxes ought to provide ample means for carrying on the administration. The new license tax obtains a fair contribution from the classes who, as shown above, have reaped the greatest advantages from the influx of money into the country of late years. An income tax would tax the class least able to pay, the men with small fixed inelastic incomes—the very class which suffers most from rises in price and scarcity.

Mr. Beadon.

The subject has had my careful consideration, and I have taken every means in my power to consult native opinion on the various points which arise for consideration in paragraph 26, chapter I., of the Famine Commission's inquiries.

2. Feeling that the intelligent object of affording relief is to raise the person relieved to a position of independence in the future, I am sure this can only be attained by a well-regulated local system of charity. It has long been known that co-operation, co-operative schemes, and facilities for saving money are the best cures for poverty; but, except in the direction of the last mentioned, this country is not yet ripe for official interference and guidance so far as chronic poverty is concerned. No doubt, whatever phase of poverty has to be contended with, the chronic or the acute, what is wanted is not to diminish private charity, but to fit it to receive better organisation and to co-operate with the official systems of relief, instead of being, as at present, wasted in numberless spasmodic andill-directed efforts.

3. We should, however, have to work with threads which, for ordinary requirements, it would be impossible to weave at present into a harmonious whole with our few and over-worked officials and our want of general intelligent aid from without. At present, public opinion applauds the unsystematic and somewhat ostentatious charity which is daily indiscriminately bestowed on the deserving and undeserving poor alike. At present, relief to the hungry stomach is recognised as a duty; but no natives give thought to the incurable or painful disease, or the mis-shapen limb, of the indigent cripple. I would, therefore, dismiss at once the scheme hinted at in the questions before us for a poor law for municipalities.

4. The most we can do at present is to create an intelligent local responsibility as regards the distribution of relief in times of general distress and starvation. In ordinary times the natural liberality of the well-to-do as regards food is sufficient for the purpose of supporting those who are reduced to beggary, nor has the time yet come when even on occasions of general dearth the system could be introduced which, in England, throws the responsibility of managing for its own indigent and helpless upon each union or circle, and any attempt to introduce a system of that kind would infallibly end in jobbery and embezzlement or feuds and slander.

5. Still there is a medium between the extremely small areas in which efforts towards relief are localised at home and the practically unlimited region throughout which all measures are matured under high pressure at the time of a famine in this country.

6. The unit which I consider the country best fitted to adopt is the district.

7. In the first place the headquarters of the district, except in a few favoured subdivisions in the most advanced parts of the country, such as Serampore and Baraset, is the lowest point at which we can hope to secure any continuous public effort and non-official co-operation in raising and controlling funds for relief operations. There nearly the whole of the intelligence of the district, such as it is, collects, and communication, either public or private, with the outlying parts is constant.

8. Local responsibility may well be centred here; and if it be based upon and regulated by firm and independent lines, taxation imposed by a deliberative assembly in the district, and collected by the agency, and in the form that that assembly shall determine, would readily be submitted to, to an extent that would give rise to intense murmuring if carried out direct by the Government.

9. The disbursement of funds so collected might well be left to the control of the district assembly, subject to the same restrictions which Government might think it necessary to lay down regarding the constitution of the assembly to secure the performance of any broad lines of policy which it may have determined on. This assembly should of course contain a strong official element in it, besides being composed chiefly of native gentlemen selected on account of position, wealth, high character, or special intelligence, and taken from all classes and all parts.

10. I will now proceed to enter into some detail as to how the views sketched above might be carried out, and then to consider the form of taxation or other sources from which funds for relief may be raised in this district.

11. To meet the famine in India let the Government of India lay down the sum which it desires to reserve as a general famine assurance fund, say 10,000,000*l.*, or 10 crores of rupees. This should be partitioned out to the different local Governments and administrations, to be raised by taxation or otherwise according to the taxable means of each province and its liability to famine. The two con-

CHAP. I. QN. 2

BENGAL.

Mr. Beadon

ditions are antagonistic, but they ought both to be considered. Say the contributions from Bengal, Behar, and Oritsa are to be two millions sterling, or two crores of rupees. It might in turn be considered proper that Cuttack, a medium district of Bengal, should contribute 4½ lakhs. This might be collected in nine years by a tax annually yielding about Rs. 50,000, *i.e.*, about as much as the present license tax. When any district has contributed the full share prescribed by Government, whatever that share may be, it should be relieved of all further taxation; in other words, after it has contributed its quota to the assurance of the whole, it should not be called on to give anything more unless the capital of the general assurance fund has to be increased, in which case a small increase to the district contribution must be made in common by each district throughout India.

12. A district relief assembly should be appointed, consisting of all the chief officials and 40 non-official members, somewhat as noted below* as regards the Cuttack district.

13. Directly the Government decides upon the portion to be contributed by the district, the assembly should be bound by legislation to prepare a scheme as to the method by which the money should be found. If the assembly be unanimous, or the question be carried by a majority consisting of ⅘ths of the whole number of members, the interference of Government should be unnecessary, and the tax might be imposed and levied by an executive order of the assembly. If there be any less majority, or even the unanimous consent of a meeting at which ⅘ths of the whole number of the assembly be not present, the report of the proposals of the assembly and the views of the majority and minority, if necessary, should be laid before Government for decision and orders.

14. When the district is first attacked by famine or there is probability of the same, the executive council of the assembly should have power upon its own responsibility to call upon Government for a moderate advance to meet immediate necessities, but the general assembly must be convened at once to determine what sum of money it should ask Government to place at its disposal for protective or relief measures; further sums from time to time being asked for in the same way, and any balance unexpended being cancelled or repaid to Government for return to the fund.

15. On the close of famine operations in a district, it should be determined by the assembly in what way the sum expended under its deliberations should be again raised, and, subject to the approval of Government, what period should be allowed to lapse previous to taxation in order to avoid any special severity attaching to its imposition. On the sum originally assessed being made full, taxation should cease.

16. The executive council of the assembly shall be composed of at least 10 members of the assembly selected by the assembly regardless whether they are officials or non-officials, but any member of the assembly shall have the right to be an additional executive member if he desires to be so. The whole of the actual distribution of relief shall be carried out by the Executive Council under the instructions conveyed at monthly meeting by the General Assembly.

17. As long as the General Assembly works unanimously, or as nearly so that ⅘ths are agreed, there should be no interference on the part of Government to any further extent than has been lately the practice in the case of relief administered from private subscriptions.

18. The assembly should have full power to appoint a salaried secretary, clerks, accountants, visitors, overseers, tax collectors, &c., as may be necessary from time to time, and all charges on account of the imposition and collection of the tax should be provided for by taxation over and above the proportional sum which has to be collected.

19. Government supervision should be exercised through quarterly reports when relief operations are in execution, but the whole management should be conducted by the assembly and its officers, and the accounts should be kept and audited in the district.

20. Any extra officers required in famine time should be supplied and paid by Government from the funds at its disposal from the interest of the accumulated capital; such officers Government would decide to send or to withhold on report from the Commissioner of the division.

21. In general terms, such should be the constitution of the fund and the assembly which should control and manage it. All such members should be public servants as defined by the Penal Code.

22. It would be easy for Government to exercise very great influence on the operations of the assembly through the influential officers who would form part of it, but it is essential that the working of the assembly should have the appearance of being promoted by free will.

---

*In Cuttack**—

Officials.
- Commissioner of division.
- Judge of division.
- Collector.
- Superintending engineer.
- Civil surgeon.
- District superintendent.
- Executive engineers (two).
- Deputy collectors (two).
- Joint magistrate.
- Subdivisional officer.
- The Government pleader.

Fifteen land-owners taken from different parts of the district.
Ten makdoms or thain ryots.
Three pleaders other than Government pleader.
Five merchants, English or native.
Two money-lenders.
Two cloth-traders.
Three men specially fitted by training or intelligence.

Mr. Glazier

The question so called seems to divide itself into the following parts:—

(*a.*) Whether it is desirable that a portion of famine insurance taxation now levied should be kept in hand for local apportionment in case of need, instead of being paid wholly into the Government revenues.

(*b.*) Whether money spent in relief from State funds could be recovered from the locality in which the same had been spent.

(*c.*) What sense of local responsibility would be created when money thus accumulated in a local fund, or advanced from State funds, with a liability to be recouped from local taxation, was expended; and what effects it would have respectively on the minds of the people and of officials in the matter of securing life and ensuring economy in the administration.

(*d.*) To what extent should this local responsibility be carried, whether to a district, subdistrict, municipality, or any special class of people who had been relieved.

(*e.*) Whether any new taxation should be imposed in modification of that portion which would not be credited to Government revenue, but kept to be used locally.

I opine that I have rightly put in question (*a*) the suggestion of the Commission, where it proposes that a portion of taxation should be local in its levy and application. The famine taxation now levied in this district is public works cess and license tax. The former yields Rs. 75,000 a year, and the latter is expected to yield the same amount, making an annual total of Rs. 150,000. At present all this money goes into the State treasury. It is, I believe, proposed to spend it on public works, if not wanted for immediate famine purposes, and thereby relieve the Government of the necessity of borrowing to a certain extent; and

BENGAL.

Mr. Glazier.

in the event of famine, the Government will then be enabled to borrow to the extent that it has previously been saved from doing, and a famine fund will thus be in existence when wanted.

Under a scheme of local responsibility, we might lay down that half of this famine taxation only should be paid into Government revenue and half funded locally; and that, in the event of famine, the Government would bear half the cost of the local relief measures, and the other half would be paid for from the local funds. In this district there would thus be (half of Rs. 150,000) Rs. 75,000, raised yearly, to be locally funded. This could be invested in Government paper in the name of a strong body of local trustees.

In the event of no famine occurring for some time, and when the local fund had consequently attained respectable dimensions, that portion of the local taxation representing the local half could be reduced or remitted. Such a scheme would, I consider, be certainly desirable. Its effect I shall consider further on.

Question (*b.*)—If a famine occurred before the local fund was strong enough to support its half of the expenditure, the Government would have to advance what was required; and if the arrangements I have suggested above were adopted, that extra payment of Government could be recouped in future years from the receipts of the local funds, and, if necessary, special temporary taxation could be imposed for the purpose.

Question (*c.*)—The effects of this local arrangement *would be good. The people would see that a part of the money avowedly raised for famine purposes* was distinctly set aside for that purpose. At present all money is lost in the abyss of the Government Treasury, and no one can trace it afterwards. If, too, in the event of there being no famine, the local portion of the taxation was reduced or remitted when the fund had increased to a certain amount, the people's satisfaction would be mightily increased.

Even if, in the circumstances suggested in the answer to question (*b*) a debt was incurred to Government which had to be recouped, the taxation rendered necessary would be borne with less discontent when the debt had been incurred for a definite object than if taxation was imposed for general purposes only.

As regards the effect of this local responsibility on expenditure as far as officials are concerned, I do not think much difference would take place. As the Government would be half sharer, its control would be much the same as now. But I imagine the effect of this local funding system would be good in securing useful local effort, if the control of the local trustees was allowed to be effective. The tendency would be somewhat that of the poor law guardians in England—a tendency to economy and harshness. This, I think, would be useful to a certain extent, and the control of the Government officials would prevent such economy from being carried to a dangerous extent.

CENTRAL PROVINCES.

CENTRAL PROVINCES.

Mr. Nicholls.

I do not think that it would be expedient to levy the cost of relief within the area of distress, at any rate not for four or five years after the occasion which had called for relief. Otherwise the recovery of the locality would be very greatly retarded, if not rendered impossible. I think the same objection would apply with even greater force as regards any particular classes, (the very poorest of all) of the community requiring relief. I am averse to "hitting a man when he is down."

I think the same objection applies to the making one province bear all its expenditure, at least to the rigorous enforcement of such a rule.

In good years the Central provinces do much towards supporting populations beyond our limits; for instance, Cuttack, the lower parts of the North-western provinces, Bundelkand, Malwa, and especially Berar and parts of the Bombay Presidency. These parts can never, when we are in difficulties, restore to us an equal quantity in grain for the money which we would repay. In times of distress at home we have had also the burden of supporting swarms of immigrants others than remunerative labourers from Cuttack, Berar, Central India, the North-western provinces, and above all, from the states of Bundelkand and Baghelkand. In case of future distress, I think we might fairly expect help from the adjacent British provinces, and, if there should be no obstacles of a political nature, from Berar also.

I think also that the efficiency of our own arrangements to meet the famine of 1868–69 was unfairly taken advantage of by, at least, some of the adjacent native states.

At the same time, I think that no hard and fast rules should be laid down on this subject; that, on the contrary, the Supreme Government should, on the merits of each occasion, as it may arise, apportion the shares of the expenditure which may be held to have been absolutely requisite to the neighbouring provinces which may equitably be deemed liable. In doing this, it would no doubt be recognised that in the same way that one district officer differs from another in his estimate of what is distress calling for relief at the expense of the State, of what is famine, and of what is absolutely expenditure, so will local administrations differ.

I do not think that it would be at all expedient to attempt to make the municipality bear the cost of feeding its own poor; townspeople are always ready, according to their utmost ability, to afford relief, first of all by private charity, and, in case the numbers of applicants become too great or unmanageable, by organised efforts, when supported by the countenance of the district officers. They make no distinction between the sufferers, whether fellow townspeople or outsiders.

Where there are municipal committees, these liberally afford employment and supply the machinery for organised charitable relief. State relief is scarcely asked for by townspeople, unless they are swamped by villagers crowding in.

I am of opinion that, if municipalities had to look forward to after-taxation, their charitable efforts would be grievously restricted, and that much ill-feeling might result from the drawing of a distinction between sufferers who happened to live in the town and those who live in the surrounding country, and who contribute to the octroi which forms the municipal income.

The knowledge that the cost of famine relief expended on their behalf would have to be recouped by local taxation would, I think, at the times when famine is not imminent, fail to induce any extra industry or providence. In a time of famine, I am inclined to think that on the people it would have a bad effect. At the present the "Sirkar," sometimes still spoken of as the "Company Bahadur," is a distant, vast, and vague, but beneficent power that must not be provoked. They hope that if they themselves are well-behaved, the local representatives of the Government can obtain money from the "Sirkar" to save them. And hitherto they have been wonderfully well-behaved, and have never claimed, as a right, to receive State relief. But if

Mr. Nicholls.

the people knew that it was not the funds of the State which would be disbursed by the district officers, but only money advanced from the Treasury to be recouped by subsequent local taxation, in a way their own money, I believe that the result would be first that private charity would dwindle, if not stop, that employment on costly tanks and works of permanent utility would, if carried on at all, be only undertaken on purely commercial considerations, that more especially the landholders, but in general all the bettermost orders of the people, would be placed in direct antagonism to those who require or look for relief, and would, while giving no relief themselves, oppose the giving of relief by Government officers, the cost of which would have to be repaid by themselves under some obnoxious form of taxation. On the other hand, among those who would not be, in their own persons, liable to direct taxation, I believe every man would be tempted to strive and scramble to get as much as he could at the common expense, and would cherish feelings of resentment towards those among his own people who would venture to oppose his clamour and importunity.

In parts of these provinces like Chhattisgarh, where the people are eminently migratory, there would be manifold greater danger, for there the lower people would get all they could from our relief so long as the famine lasted, and when the cost came to be levied, they would cross the borders into the feudatory states and into our zemindaris, and laugh at our schemes of subsequent and strictly local taxation, while the tax crushed those whose previous efforts and frugality had given them interests in the land, interests which would now chain them to their homes, and would not allow them, like the improvident ones, quietly to remove themselves beyond the jurisdiction of the tax collector.

As for the temper of the officials, I think that in the hopeless task of arriving at the truth amid the conflict of interests and misstatements, of keeping order between the opposing claimants, the one for economy, the other for lavish expenditure of the money of their betters, and being in want of the insight now afforded into the condition of the lower strata of society by the flow of charity and the result of individual efforts to give employment on works of "dharm"—they would be very unwilling to take decided steps in good time, and that eventually those whom it might be intended to benefit would be the greatest sufferers. It must not be forgotten that only those who would have to bear the after-taxation, and therefore who would be likely to oppose relief measures, could possibly make their opinions publicly known through the press. And, again, it is only by their agency that relief measures could possibly be carried out, unless we fill the country with borrowed Government officers, who could do but little good if the leading people of the rural tracts were opposed to their efforts. I think it will be an unfortunate day when the idle or improvident villager can demand as a right support at the hands of a Government officer, to be afterwards paid for by the industrious and provident inhabitants of his own village. Yet the same people, under present circumstances, though paying to some mysterious assurance fund, would be quite ready and willing to help their idle, improvident, or unfortunate fellow villagers so far as they can, if they be allowed to do it in their own way.

Mr. Neill.

It is asked what would be the effect on the minds of the people, and on the temper of officials, of the knowledge that famine relief would have to be repaid by local taxation. On the people I believe the effect (at the time when the famine is on them) would be nil. Who are those who have chiefly to be relieved? The poorest. They take no thought for the morrow; they pay no taxes (that they know of, the effect of indirect taxes and state monopolies being hidden from them); they have nothing to fear from fresh taxation, even if they thought of the matter at all. On the better classes the effect would not be greater. They would no more than the others realise that they would have to pay for the expenditure that was being incurred—they still believe the Government purse to be inexhaustible, and they cannot even now always understand why the Government is so grudging in its general expenditure. In famine times the better class of natives are liberal; they would expect the Government to be so also, and they would not count the cost, even if they could count it, and I doubt if they could even form an estimate of the rate of expenditure being incurred, and the pressure of taxation which they would subsequently have to submit to.

Neither do I think that the effect on the temper of the officials would be great. They are not permanently attached to localities. They are moved from place to place as the exigencies of the Government service demand. It is not by any means sure that they would have to raise the additional taxation which the famine expenditure involved; even if they had to do so, it would not necessarily be a concern to them. It seems to me they can have no motive in knowingly spending more money than is necessary; and if they are mistaken in their views as to the amount of relief necessary, the knowledge that the expenditure will have to be provided for by local taxation would not give them a truer insight into matters. An honest official would do what he considered necessary, regardless of consequences. I am inclined to think that lavish expenditure is not more to be feared than niggardliness; that officials are, as a rule, careful of the Government money; and that, generally speaking, they would look for and try to obtain the approbation of the Government by doing what appears much at a small cost. Officials generally take their clue from the Government which they serve, and it depends very much on the nature and tone of the instructions issued by the Government whether a famine is encountered in a calm and sober, or in a flustered and extravagant, manner. This being the case, I admit that in the interests of the Imperial exchequer it may be desirable that a province which has suffered from famine should meet from its own resources a portion of what has been expended on famine relief, and should not draw on the "mutual assurance fund" and the Imperial treasury for the whole. What proportion of the whole expenditure should be thus made good would, I think, have to be settled by the Government of India in each case as it arose, and would depend on the severity of the famine, the condition of the province, the extent to which it had permanently benefited by the famine works, and its contribution to the mutual assurance fund; and the way in which the repayment would be made would be by the Government of India demanding from the Local Government a larger contribution on account of the sources of revenue and departments made over to it, than it now receives. This larger contribution would be paid for so many years, until thereby the provincial contribution to the famine expenditure had been made up. The Local Government would then have the choice of reducing its expenditure on administration—of proceeding more slowly with public works, or of resorting to fresh taxation. In this manner provincial responsibility would, I think, be sufficiently enforced without the general principle of mutual assurance being departed from, and without the difficulties noticed as attending an attempt to localise taxation on account of famine relief being encountered.

CHAP. I. QN. 26.

CENTRAL PROVINCES.

Mr. Neill.

With regard to a municipality bearing the cost of feeding its own poor, I think municipalities would generally do in that way all that could fairly be required of them. Experience has shown that in times of scarcity or famine the poor from the rural districts make their way to the towns, where they beg for relief; and in the towns not only are large numbers fed daily by private charity, but municipalities also organise relief houses. I do not think it would serve any good purpose were the duties of municipalities more strictly defined. I think there can be no doubt that they would always co-operate with Government in times of famine, and that no compulsion is necessary.

Mr. Grant.

It is a more open question whether the famine fund might not be applied so as "to bring into operation a sense of local responsibility;" but it would be perhaps difficult so to direct this sense as to combine the objects "of securing the lives of the people, and of "protecting them from unnecessary expenditure on "relief." These are almost opposite ends; and the same incentive would not work towards both of them. People spending what they knew to be their own money would, of course, be more careful of it than if they were dealing with funds coming from an unknown, and to them apparently an inexhaustible, source; but I cannot see how the sense of local responsibility, developed by localising taxation and expenditure, could possibly have the effect of stimulating the humanity and generosity of the taxpayers. Of course, if to this increase of localisation be superadded direct local responsibility for life, relief committees would be induced, both by their own respect for authority and by the pressure of the executive, to interest themselves in combating starvation; but both the incentive and the line of action would be different from those of operating in the cause of economy.

Admitting, however, that authoritative pressure might be relied upon to counteract the economical promptings of self-interest, it would be a clear gain to enlist the natural impulses of taxpayers on the side of economy. One fault of the present system of applying famine taxation is that it is over the heads of ordinary tax-payers; they cannot see, and perhaps might fail to see even if it were explained to them, how they are to gain in times of distress by the fresh imposts. To them the famine taxes must appear very much in the light of mere additions to existing taxation, and must thus fail to carry with them their proper recommendation; forming part, too, of the Imperial income, they may create a tempting, if delusive, show of surplus assets, and thus may prove a source of embarrassment to the Government. I think much stress should be laid on the first of these objections, looking to the admitted difficulties and risks, in this country, of fresh taxation and the consequent desirability, if not necessity, of carrying the people as much as possible with us in all such measures. To this end the establishment of local famine funds, visibly built up from the proceeds of the special taxation, and applied in the times of famine by members of the local tax-paying body would be serviceable, as bringing the scope and working of the new measures within the experience of all.

Of course, if these funds are to be created in order to develop a sense of local responsibility, and to satisfy the people of the good faith of the Government in its fresh taxation, they must be strictly localised, and they must be so employed as to be readily available in case of need. There would be no difficulty, with our existing organisation, in adding to existing local funds a fresh department for famine purposes, and in controlling its management, in a sufficiently representative manner, by means of some modification of the present local Committees. It might not be quite so simple to find suitable employment for famine funds. In some few cases they might perhaps be devoted to remunerative public works such, for instance, as a town water scheme, guaranteed on municipal revenues. A more appropriate way of using them would be in loans to clear off encumbrances on estates placed under the management of the collector by embarrassed landholders. Money is often wanted for this purpose, and is never procurable under 6 per cent., rarely at so low a rate. The security being excellent, famine funds might be lent out to these estates at 5 per cent., subject to withdrawal in case of famine, which it would always be possible to foresee soon enough in advance to admit of the funds withdrawn being replaced by loans taken on ordinary terms in the open market. The encumbered estates would thus gain by enjoying loans for a time, at any rate, on reduced interest; whilst the famine fund would be always capable of mobilisation with sufficient promptitude. Such projects as these, however, obviously require to be weighed and tested by local experience before they can be entertained; and I merely throw them out as suggestions for discussion should it be determined to localise famine funds, and to seek some means of employing them profitably. It must not be forgotten that, however great may be the advantages of throwing light on the objects of the special taxation, and of awaking a sense of local responsibility, by providing local insurance funds against famine, yet that any scheme of the kind must infallibly end by substituting State aid for self-help, and thus in laying the foundations of a terrible incubus on the country.* It may be that, as manufactures develop and communications increase, the poorer classes will be more and more cut off from the supports which they now find in the peculiar fabric of Indian society, and that a poor law will be forced upon us. But that time certainly does not seem to have yet arrived; and, so far as I know, the relief of the poor may still be treated as an exceptional emergency. I should much regret to see it take a visible place in the ordinary administration of the country; and for this reason it may, on the whole, be best to devote the proceeds of famine taxation to the reduction of debt,—not, as at present, indirectly, by allotments to reproductive public works, but separately and specifically, so as to interpose no complications of account between the objects of the Government and the more ignorant of its tax-paying critics.

To the minor questions in this group I have very little to add to Mr. Nicholls' replies. I see no reason why the principle of local administration, if adopted, should not be applied to tahsil subdivisions as well as to districts. At present there is a single local committee for each district; but I am aware of nothing to prevent the constitution of similar committees at the headquarters of each tahsil. They would aid the tahsildar as consultative bodies, and sometimes in executive duties. In this part of India, at any rate, the office of "panch," or committee man, is quite familiar to the people, and is not unappreciated by them. Every town has its municipal committee, and most large villages find members enough for a local school-board. The position of "tahil panch" would be more honourable and more sought after than a seat in less important committees; and, if circumstances even required it, then sub divisional "panchayats" might pave the way for some modified form of representation. They would in the meantime, to some extent, strengthen the hands of the executive in any attempt to deal with the relief of the poor by local organisation.

Municipalities cannot, I think, be charged with the cost of relieving all applicants coming within their

---

* On this point I need not say much, as I have already written at length on the subject; and my views, if worth having, may be found in the 1877 volume of the "Nineteenth Century."

Central Provinces.

Mr. Grant.

limits until similar measures be extended through the length and breadth of the country. Even now, every town is, in times of famine, a focus for the collection of distress; and if the present occasionally intermittent efforts of private charity were to be replaced by an organised drain on the pockets of the townspeople, far more than their legitimate share of poor relief would be thrown upon them.

BOMBAY.

Bombay.

Colonel Anderson.—Instead of waiting entirely till famine came on, it would be preferable to anticipate it by reserving annually a certain small portion or percentage of local or provincial funds to meet at any rate the first calls of a famine year, and further, for the future realisations of the famine reserve fund to be liable up to a certain number of years' accumulations to repay the debt to the Imperial Exchequer. This would have some effect in enforcing and bringing home the sense of local responsibility for famine expenditure. I do not think that any plan for compelling a municipality to support its own poor would work; there would be extreme difficulty in discriminating between its own poor and immigrant poor.

The probable effect of a knowledge that a part of the famine expenditure would be recovered from the country by future taxation, first, on the people, would be to dry up all private charity; secondly, on the officials, it might tend to economy; but in consequence of the check to private charity, the expenditure of a larger sum on public relief would be rendered more absolutely necessary than would otherwise be the case. In every point of view, therefore, it would appear that the forestalling famine by the establishment of a reserve fund is more expedient than attempting to meet it in the main by additional and special taxation at the time or soon after.

Mr. Spry, Kaladgi.—The municipalities in this district have during the last famine borne their full share in affording relief by expending their cash balances, and even by raising loans, for the purpose. This has been done voluntarily, and probably the same has been done in other districts, and would be again. Therefore I do not see any cause for making such a burden compulsory.

The probable effects of special local taxation, and of making people think that they would be responsible for local relief, would be at once to shut up all private charity, and much more harm than good would be done; and I doubt whether it would be any check upon officials. I do not think that the public mind is sufficiently advanced to appreciate local responsibility, at least in this out of-the-way part of the country.

Mr. Ramsay, Kaladgi.—I am not prepared to recommend any scheme such as that here adverted to. It would be like an introduction of a form at least of the English poor law into India, and would be most obnoxious. The idea of municipal taxation for the support of the poor would be most repugnant to the feelings of the people. Charity is a virtue highly prized and practised in India, and taxation as above would tend to break down this feeling. The people should no doubt support their own poor, and this they do in their own way. Government interference would destroy the very springs of all private charity, and produce much more evil than now exists. In times of distress private individuals and committees have always been found ready and willing to act and to contribute, and it would be a fatal error to do anything to check this most creditable tendency on the part of the people. Government interference should be restricted as far as possible to guiding and assisting, if necessary, private efforts for the support of those unable to do anything for themselves, while its main action should be in the way of providing work for those fit and able to do it. Local and partial taxation is most obnoxious, and should, I think, as far as possible, be avoided. It is the partial nature of the recent license tax that has called forth such a very general feeling of opposition to it.

Mr. Norman, Poona.—From the purport of this question, I presume Government hope to devise some scheme under which districts or subdivisions of districts can be made to reimburse the State for famine expenditure. I do not consider this possible. The famine was most intense in that part of the district which is most impoverished, where, owing to the scanty and precarious rainfall, a good harvest is the exception. To a great extent this must be the case everywhere. The poorer districts owe their poverty either to inferior soil or to unfavourable climatic conditions. The cultivators have little opportunity of accumulating capital, and at once feel the effect of a bad season. The land is already assessed as high as it can bear and the existing settlements render it impossible to increase the land assessment even if it were possible to do so. It is true that until the imposition of the license tax the trading and artisan class had, for some years past, escaped all direct taxation; but in the poorer talukas these classes are not very numerous, and it would be impossible to compel them unassisted to bear the cost of a famine. For these reasons I consider it would be impracticable to make local communities responsible for the expenses of a famine. I do not think that any attempt should be made to apply this principle to any less area than a province; and in Bombay, I think, the Presidency limits should be accepted as the area within which an attempt might be made to insist on the people bearing the expenses of any local famine.

As to the manner in which funds should be raised for this object, I can suggest nothing better than an income tax. This is not the place to discuss the financial measures of Government, but I cannot help expressing an opinion that the present license tax will prove most unpopular with the mass of the population, and that it will yield a minimum revenue with a maximum of annoyance to the poorer classes of traders and artisans. A moderate income tax, which did not touch the lower class of incomes, would yield a much larger sum, and would be collected with much less difficulty. It would be for the financial advisers of Government to decide how this fund should be expended, and on this point it is very difficult to offer an opinion, but the greater portion should be invested in the public loans. Irrigation works, when the sources of supply are undoubted, are a great preventive of famine, but in this part of the country it is doubtful if any new schemes of this nature can be discovered. Irrigation from tanks must depend upon the rainfall, and when that fails the works become useless. No new roads are required in this district, the means of communication being ample, as was proved last year; and though many of those which have been commenced are still unfinished, the completion of them may be left to the local fund committees without aid from Government.

With regard to the liability of a town or municipality to support its own poor, I think this is a principle which might be carried to a greater extent than has hitherto been the case. In prosperous times all village communities support their own poor who live by begging, and the same is the case in towns. The people thus supported are those who are incapable of doing any work, such as lepers, cripples,

&c., a list of whom could, without difficulty, be prepared. I think the village communities might be compelled to support this class, the expenditure being in the first instance advanced by the State, to be recovered eventually by a house assessment. The relief thus afforded should be managed by the village officers or by the municipal committees, under general instructions from their superiors.

Mr. Charles, Dharwar.—The principle here mentioned seems to me exceedingly difficult of application. A very large proportion of the persons supported on relief works in the Dharwar collectorate belonged, not to the district, but to Bellary, Maisur, Raichor, Kaladgi, and the several native states, Sirhatti, Ramdrug, Kundgol, &c. It would be very unjust to the people of the Dharwar district to make them pay for the support of people who do not belong to the district at all, and, on the other hand, it would be next to impossible to either restrict the relief to Dharwar people or make an accurate estimate of the proportion of outsiders on the works, the latter varying from week to week.

The expenditure in a single subdivision should certainly not be recovered from it, as it would constantly happen (as in the case of the Kalghatgi taluka) that large and expensive works were carried on in it, not because the people of the taluka required help, but because it was a convenient and healthy place to concentrate the famine labour.

On the other hand, some of the talukas which suffered most had hardly any famine works in them, the famine labourers being sent elsewhere, partly in order to apply the distance test, partly because there was no work available in the taluka. My own feeling is against this principle entirely. No municipality could stand the expense of feeding the famine-stricken who flock into it, and it would be impossible to tell how much of the expenditure was on account of outsiders.

Mr. Percival, Sholapur.—In a district the whole of which has suffered from famine the local funds fall off and get into debt, the municipalities exhaust their balances, the cultivators lose half their cattle and most of their savings, and there is the Government revenue in arrears to be paid. If a famine covers a whole province or presidency, that province is similarly affected. To add to the arrears of revenue, a very large sum for famine expenditure would crush the district or province; it would be impossible to collect it all. There are two classes of persons to be provided for during a famine—(1) the labourers and poor cultivators who can work, and (2) the sick and feeble who cannot. It is the duty of Government, as the owner of the land, to arrange for the first either by providing them with work in their own district or elsewhere, or by encouraging and assisting them to go where they can find it. Government can turn their work to the advantage of the country, and see that a fair return is obtained for the money spent. On the other hand, the people of India are in the habit of supporting their sick and infirm; they willingly give labour, money, and grain for the purpose, and they can do it cheaply and effectually. If Government try to do it they are cheated in all directions, the tests they are obliged to enforce are hateful to many and drive them away, and the system is costly and ineffectual. It should be left to the district to provide for the incapable. The knowledge that if they failed Government might interfere and collect the cost from them afterwards would act as a stimulus, if any was wanted. Distressed persons from other districts would be kept out, and each town and large village would be forced to look after its own poor, while taluka and district committees would watch the rest of the villages and collect funds from far and near for systematic distribution. As a matter of fact, during the famine three-fourths of the charitable relief was from private sources, but it was not so systematised as it should have been.

Mr. Erskine.—I view with extreme distrust any proposals of the nature of those made in this paragraph by which it might be rendered practicable to provide that, where State funds have been expended on the relief of famine, such expenditure should be recovered from the locality which has benefited by it. It seems to me that, in case of famine, funds expended to meet the necessary charges should not be repaid by any single district. If a district has suffered from famine, it is presumably in a worse condition to repay any part of the cost than other parts of the Empire; and any attempt to make it bear such charges would, in my humble opinion, be not only unjust, but impolitic. To begin with—the expenditure incurred is so incurred without consulting the population of the district; they have no voice in the matter, neither do they exercise any control over the expenditure. Such expenditure seems to me essentially in its nature an Imperial charge incurred for the well-being of the State. It would be as just to assert that, if an expedition was fitted out to punish frontier tribes who had been plundering frontier districts, the whole cost of such military expedition should be borne by the frontier districts concerned, as they "benefit by it," or that the whole cost of an expedition to suppress pirates should be borne by the merchants whose trade was affected by the acts of piracy, as they benefit by it. Yet I have never heard such an idea broached. The suppression of a famine is quite as much an Imperial matter as the punishment of frontier tribes or the extirpation of pirates, and the cost should equally come out of general revenues.

Private charity steps in to supplement public expenditure, and to the credit of the natives of the country be it said that they have always come forward liberally to aid the distressed; but were any endeavour made to tax localities in consequence of famine, the springs of private charity would inevitably dry up, and much unnecessary odium would be incurred by Government in raising by taxation those sums that are now voluntarily paid.

In like manner, I do not think a municipality in times of famine should be compelled to bear the cost of feeding its own poor. Scarcely any municipality has sufficient funds to do this, and extra taxation would therefore be necessary at a time when, owing to increased expenses of living, such increase would be unusually unpopular, and would be looked on as a great hardship. Were any attempt made to compel municipalities to feed their own poor, they would be sure to refuse to feed non-residents, and these, who form in many cases the larger number of applicants for relief, would still have to be provided for from State funds. Were such a system in force, it would lead, I fear, to those who require relief being sent frequently from one relief-establishment to another, and would give rise to confusion and complaints. Not having had any experience in a district where real famine prevailed, I am unable to say whether the sense of local responsibility could be brought to bear, but I am inclined to think it could not be so with any real advantage.

It appears to me that the system of local responsibility for the relief of famine sketched in this question amounts in principle to nothing more or less than a poor law. In my humble opinion, the introduction of a poor law in India would be the most fatal error we could commit, and would be equally ruinous to the finances of the empire and to the character of the people. At present, every family, every locality, every community, is by custom responsible for the care of its own helpless or destitute; and the readiness and thoroughness with which the responsibility is accepted is one of the best traits in Hindu character. When, in the case of famine, the people cease to take care of their own poor, it is simply because they are no longer able to do so; and I fail to see how any enforced system of local responsibility will restore to them the power they have lost.

Mr. Pedder.—We—being apt to adopt any phrase that happens to be current in England—usually think

CHAP. I. QN. 26

BOMBAY.

that the native habit of almsgiving demoralises the people. I very much doubt it here. The people know each other's circumstances very well; and a family will not maintain a member who could work for himself, nor neighbourhood a person whose own family are able to maintain him. With the single exception of religious mendicants (and their case could not be touched by a poor law), I believe that all the people who live on the charity of the public are really destitute, who would otherwise have to die, or under a poor law to be supported by the public, no matter what tests might be applied.

But once we declare the principle of local responsibility for relief,—that is, as the people will understand it, that Government are going to take care of the poor,—we shall find in a few years that the people will decline to take care of their own poor. "Why," they will argue, "should I maintain my own halt and "blind, and also pay taxes to maintain other people's?" Then the charge on local revenues will be ruinous; the people will be demoralised, because Government agency can never distinguish real destitutes as the people now do themselves; and from imperfection of agency, and from the desire of avoiding indiscriminate relief of the undeserving, the really destitute will not be half as effectually supported as at present, and there will be constant scandals and complaints of a cruel Government which allows the poor to starve.

But even supposing that this local responsibility can be restricted solely to the case of actual famine, the result of the principle, it seems to me, is simply to throw the burden on those localities which are least able to bear it, and thus to check the natural recovery, when better times come, of a famine-stricken tract.

As for the effect on the temper of the officials of the principle of local responsibility, I should imagine that a worldly-wise official would try to prevent deaths from famine, no matter at what cost; and, on the strength of his success, would endeavour to get promoted somewhere else before the *mauvais quart d'heure* of payment arrived.

In fact, it seems to me that the old rule is safest—that, when one member suffers, all the members shall suffer with it. I must say I do not believe in nostrums like this of local responsibility against famine. We had best, it seems to me, stick to the straightforward plan; admit that there will from time to time be heavy charges on account of famine relief; economise the resources of the Empire, so as to be able to meet these occasional extra demands; not start a famine till we are sure that the distress is such as cannot be met by the ordinary resources of the people; then meet the local calamity with the power of the country generally; and get what set-off we can against the misfortune by utilising the labour-test to provide those public works which, from not being directly remunerative, cannot be afforded under ordinary circumstances.

MADRAS.

MADRAS.

Sir W. Robinson.

I do not myself appreciate the principle of a mutual assurance fund as applied to the financial exigencies of a tropical famine; the principle of a local poor rate seems to me more in keeping with precedent and circumstances. The moral obligation that a population must not be permitted to let its poor starve to death under any circumstances holds good in India, as it does elsewhere It is, of course, more difficult of administration here, from the spasmodic and large proportions of the occasional demand for poor law aid; but it is not on the whole an impossible matter to meet it with some moderate success, either as respects the administration of relief or adjustment of the consequent poor rate burden. This is, as it appears to me, a matter of distribution. The poor in India get on fairly well under ordinary circumstances without taxational aid, and we do not need a regular poor rate as yet. But a famine comes, and the accumulated obligation appears at once in a very aggravated form, and the additional burdens cannot be borne by the people while the calamity is running its course. The question seems to me to be:—How best to arrange for the recovery of the necessary expenditure. The collection of a practical poor rate by taxation in advance does not commend itself to my judgment; and always must, I think, be (as in the case of the license tax) received with feelings of distrust by the people. I confess that I cannot devise a more practical solution of the financial matter than to advise that the fisc advance the needful poor rate from the public purse as a local loan, to be recouped with interest as the country recovers after the disaster has passed. I have stated my views on this point somewhat more fully in my answer to Mr. Ballard's questions. The mutual poor rate should be provincial, and of course the necessity of repayment would have the usual effect on the minds of the people and of the Executive; and, what is equally important, I think that there would be less anxiety on the part of the fisc than has ruled of late. Do what we may, famine rescue must be costly and long-protracted.

CHAPTER II.

RELIEF DURING EARLIEST STAGES OF DISTRESS.

1. Indications of Approaching Drought.

How does distress consequent on drought first make itself felt among the people, and how is it first brought to the notice of the district officers? What are the indications by which the district officer would judge whether the distress is due to temporary or local scarcity, or is likely to be the forerunner of very severe general distress ending in famine? What steps should be taken to ensure that such indications are brought to his notice? To what extent does the existing district organization suffice to ensure early and trustworthy reports, and if not sufficient, what other measures are suggested as requisite? - - page 1.

2. Classes of Rural Population first Affected.

Which classes of the rural population are first affected by serious failure of crops likely to produce famine? In what way are they affected, and how is the effect manifested? Do the early applicants for relief consist of whole families or of isolated individuals? Are all sexes and ages equally represented, or do women and children preponderate among them? So far as the applicants are field labourers deprived of employment, does this arise because the employers have no money or grain to spend on wages, or because there is nothing to do in the field? - - - - - - - - - - page 10.

3. Classes of Urban Population first Affected.

What classes of the urban population are the first to feel the effects of famine, and in what way do those effects operate on them, and how do they manifest themselves? How may they best be watched and met in their first stage? - - - - - - - - - - - page 19.

4. Proportion of Population Supported by Private Charity.

There is a considerable number of poor and infirm persons who in ordinary years are supported by their richer relations and friends or caste fellows, and of habitual mendicants, but who become claimants of State relief when scarcity or famine arises. What is approximately the proportion of this class to the total population, and at what stage do the springs of private charity begin to dry up? - - - page 22.

5. Forecast of Condition and Requirements of District.

It is obvious that if an accurate forecast of the condition of the people during the approaching season, following any more or less serious failure of the ordinary harvest, could be made by the district officer, it would be of great utility; in what way could he make it, and on what data should his calculations be based? Suppose, for instance, that he estimates that half the average food crop has been lost; for the support of how many people does the balance that is saved suffice? How are the rest of the people to be fed? He must form an estimate of the food stocks in the country and of the power of trade to bring in more. Supposing these two elements sufficient to supply what is wanted there would be no famine of food. But there may be lack of money to purchase food; how is an estimate to be framed of the number of persons who would probably be able to purchase, and of the number who [illegible] assisted by the State, either by employment which will bring them wages, or by food if they [illegible]? These would consist mainly of the classes indicated in questions 2, 3, 4, viz., the field labourers, [illegible] poor, and infirm dependants or mendicants. What numbers approximately of these classes would you expect to have on your hands if the food crops in your district failed to the extent of ⅓, ½, or ¾? and if this happened in two consecutive years? - page 25.

6. Measures to be Adopted to meet Temporary Distress.

What measures should the district officer adopt for relief supposing that he believes the distress to be temporary, or is not satisfied that it is indicative of approaching famine? Should applicants be first employed as far as practicable on the ordinary works in progress, whether under provincial or local officers, or under agents of the Public Works Department or municipalities? Under what tests should applicants be admitted? Under what circumstances may it be desirable to open special works? How should such special works be arranged? Whether so as to collect the applicants in comparatively large numbers at a few localities, or to give them employment in smaller bodies at many places in the distressed region and in the vicinity of their homes? May such works be best placed under the Public Works Department or under civil supervision? State the arguments in favour of and against either course. How may the Public Works officers be best placed in communication with the district officers for these purposes? How should the Public Works officers be guided in their selection of works for relief? And on whom should the responsibility rest in the district for seeing that all needful steps are taken by all branches of the public service concerned?
page 41.

7. Poor-house Relief without Labour Test.

Under what circumstances should poor-houses be opened to give relief without a labour test? Are there any other practical ways of affording relief at this stage except through private charity? - - page 62.

8. Field for Private Charity at Early Stage of Distress.

Is there at this stage of the operations any field specially appropriate for the intervention of private charity? If so, what is that field, and how should the charity be organized and directed? - page 67.

9. LOCAL COMMITTEES AND NON-OFFICIAL CO-OPERATION.

To what extent and in what manner may the organization of municipalities and local fund committees, so far as they exist, be utilized in this stage? In the absence of such local bodies how could the co-operation of influential non-official persons be best organized and utilized either in connexion with the regular district authorities, or otherwise? State specifically what plan would be suitable in your district? - - page 70.

10. VILLAGE INSPECTION.

Have cases occurred in which such measures as those referred to in paragraph 31 *of chapter III., regarding village inspection, could properly be introduced during this, the earliest stage of distress?* page 77.

11. LOCAL CHARITIES FOR DISTRIBUTING FOOD.

What local charities exist in your district for distributing food to the people? Are they appropriated to any particular class, or are they available in times of distress for feeding people of all classes? What is their annual value, and how many people are benefitted by them? How are they managed? Could they be made more effectual for charitable purposes in times of famine? - - - - - page 80.

12. INDICATIONS OF DISTRESS HAVING BEEN UNDERRATED.

It is assumed in question 6 *that the district officer believes the distress to be temporary, or is not satisfied that it is indicative of approaching famine. But it is possible that he may be mistaken in his appreciation of the facts he at first observed. What indications would lead him to conclude that he had been mistaken and that famine is imminent? What steps should he take to have any such indications brought to his notice? The most obvious points would be such as these: to obtain the best information as to the character and progress of the crops on the ground; as to the prices and the kind of grain exposed for sale in the markets; as to the fullness of stocks in the market, and the quarter whence they come; as to police returns of lawlessness and crime; mortuary returns of deaths; reports of deaths by starvation in villages, and more especially roadside deaths; emigration or movements of the people in any direction; sales of ornaments and jewels. Are there any other such indications, and in what way should he secure that such facts should be immediately brought to his notice?* - - - - - - - - - page 83.

13. INDICATIONS OF DISTRESS HAVING BEEN OVERRATED.

On the other hand, the distress which the district officer has held to be serious, though temporary, may turn out to be so slight as to require no special measures of relief. What are the indications which would lead to the conclusion that this is the case, and what steps should he take when he comes to that conclusion? Are any precautions requisite to guard against an erroneous estimate of the necessity for offering relief other than those which are supplied by the application of suitable labour or other tests? - - - page 87.

CHAPTER III.

FAMINE RELIEF.

N.B.—*In answering this and all other questions in this chapter, remember to draw the distinction (where necessary) between the three periods of famine—its beginning, height, and decline—and also between P. W. D. and civil relief-works.*

It may be assumed that the State is responsible for offering the means of support to all persons not able to provide for their own maintenance during time of famine, subject to the imposition of such tests as will prevent relief being given to persons not really in want, and will protect the public finances as far as is practicable. The methods of affording direct famine relief to persons in want in time of famine hitherto adopted by Government are—

(1.) *Relief given subject to a labour test or in return for labour.*
(2.) *Gratuitous relief not subject to any labour test.*

Relief work may be divided into that which involves—

(1.) *Unskilled labour, commonly earth-work.*
(2.) *Skilled labour for artizans.*

Gratuitous relief may be divided into—

(1.) *Relief given at poor-houses.*
(2.) *Relief at home.*

SECTION 1.

2. Public Works Department and Civil Agency Works.

The first division of relief-works for unskilled labourers may be into works supervised by officers of the Public Works Department and works supervised by the civil officers; the former will generally be works of greater permanent utility, requiring more skilled supervision, and taking a longer time to complete; the latter will usually be less important, less generally useful, and simpler in character. State what are the circumstances under which either class of work is preferable. Referring to the considerations mentioned in paragraph 7 of the Resolution of the 16th May 1878, quoted in the margin, state also if you consider that there is any class of labourers to whom the one kind of work is more suitable than the other, and what are your reasons for this division? - - - - - - - - - - - page 90.

“ Officers trained in the Public Works Department should possess the knowledge and experience necessary for keeping order among crowds of relief labourers, for exacting from them adequate tasks, and for turning their work to the best advantage; but works conducted under their agency are not free from the danger of providing insufficiently for those who are feeble or unable to give a fair out-turn of labour. District officers without professional training do not ordinarily possess the above qualifications in the same degree, and are commonly occupied with other duties. On the other hand, it is peculiarly the province of district officers to make arrangements for receiving applicants and admitting them to relief, for classifying them according to their strength and capacity for labour, for organizing them into gangs, and thus encouraging members of the same village to keep together.”

3. Large and Small Relief Works.

Relief-works again may be conveniently divided into small and large, that is to say, works employing (say) 300 *or* 500 *labourers for about one month only, and works employing a larger number of labourers for a longer period. Though this division generally corresponds with the division into civil and Public Works Department works, it does not necessarily do so; a small work might be under a Public Works Department officer, and a large one under a civil officer. State under what circumstances you consider small works to be admissible, and what the advantages and disadvantages attached to them are at different periods of a famine* page 106.

4. Tests for Admission to Works.

The three main tests hitherto adopted to justify the admission of persons to relief-works are—

The Distance Test.—Under which the need of relief is proved by willingness to go a certain distance to obtain it.

The Wage Test.—Under which the need of relief is proved by willingness to accept a wage which is little more than a bare subsistence.

The Labour Test.—Under which the need of relief is proved by willingness to do a fair day's work according to the strength of the labourer.

Would you propose to adopt any other tests than these? If so, describe them. Would you reject applicants for labour because their appearance, clothing, or the ornaments they wear do not indicate penury? If so, would you do this equally at the beginning, during the height, and in the decline of a famine? - page 111.

5. The Distance Test.

State how this test has been applied within your experience of famine, and how you think it should be applied. What amount of distance has been considered sufficient for the test? Was it enough that the labourers should have to go some distance to and from the work? Or was it insisted on that they should live away from their homes? If A is a work near village Z, and B is another work 10 *miles off, have the inhabitants of Z been refused admittance at A and directed to go to B? If so, what measures were taken to ensure that they did go to B? If the test has been relaxed, state under what circumstances. Has the test been effectual, and has it kept away persons who were not in distress? Has it been too severe and kept away people who were in distress? What modifications would you, from the experience now gained, propose in applying the test?* - - - - - - - - - - page 116.

6. THE WAGE TEST.

Where relief is given in the form of money wages, the wage will be chiefly based on the quantity, kind, and price of food required to support life, with a margin for condiments and contingencies. What are the assumptions as to the quantities of food to be given to labourers of different ages, sexes, and capacities for labour, and the extra allowance for condiments, &c.? Have you any data by which to test the accuracy or error of the assumption made as to the quantity of food required? State your experience as to the physical condition of labourers who have for some time subsisted on any given relief wage, giving the amount of that wage, and the quantity of food it supplies? What have you ascertained as to the actual kind and quantity of food purchased by labourers with their wage? How is the price ascertained of the standard kind of food on which the wage is based? How would you, with your present experience, formulate the conditions of the wage test? - - - - - - - - - - - page 128.

7. SYSTEM OF PAYMENT.

What is the best way of paying wages, daily or less frequently; at morning before work begins, during the day, or at evening when work is over; by calling out nominal rolls, or by tickets, or by a combination of these? To whom should the payment of wages be entrusted? Explain the system of supervision most approved by experience of checking payments and of preventing laxity and fraudulent practices in the disbursement of wages? Have labourers been paid in grain, or partly in grain and partly in money? Under what circumstances is this desirable, and, if necessary, how is it best arranged? Have wages ever been paid by tickets, on presentation of which at a trader's shop food would be delivered? What would you advise in this respect? - - - - - - - - - - page 155.

8. PREVENTION OF FRAUD.

What system do you recommend to prevent frauds by persons on the works, such as the receipt of wages by those who have not worked? What steps should be taken in the case of persons who have been absent at any of the roll-calls, or who have worked part of the day, but not all of it, or who, having worked during the day, are accidentally absent when wages are paid? - - - - - - page 165.

9. WAGES IN SICKNESS.

What wage should be given to those who are prevented from working by sickness (1) *when there is a hospital attached to the work,* (2) *when there is none?* - - - - - - page 167.

10. THE LABOUR TEST.

What are the principal descriptions of work on which fixed daily tasks are applicable, and what tasks have been insisted on? How are the labourers classified according to their physique; by whom and in how many classes? What steps are taken for raising labourers from one class to another, according as their physique improves, or vice versâ? How are they ganged, and into how large gangs? How is their work measured up; by whom, and how often? How are they punished for not completing their tasks? What steps should be taken to test the report of the measuring official to secure that the labourers are justly punished or deservedly paid in full? What steps are necessary to compel persons receiving relief to work? In those sorts of work on which it is impossible to apply the task test, what test can be applied to ensure that the labourers earn their wage properly? - - - - page 168.

11. PIECE-WORK.

Under what conditions, if any, is payment by piece-work practicable on relief-works, that is, payment for quantity of work done at a fixed rate, irrespective of the amount of daily earnings? What are the advantages and disadvantages of the system? When it is advantageous, how can it be best adopted on a large scale, and what precautions would be necessary to prevent its abuse? - - - page 176.

12. HOUSING, SANITARY ARRANGEMENTS, AND DISCIPLINE ON RELIEF WORKS.

What is the best form of hut for labourers on a relief-work, and what the best method of arranging them in a camp? What is the cost of hutting per head? Should the huts be erected by specially hired labour or by the relief labourers themselves? What points require consideration in selecting a site for such a camp? What sanitary arrangements should be prescribed in it, especially as regards latrines? What establishment is necessary to look after these arrangements? What Police or other establishment is necessary to preserve discipline and to prevent robberies? How should this be organized? - - - page 185.

13. BAZAAR ARRANGEMENTS IN CONNECTION WITH RELIEF WORKS.

What arrangements do you recommend for a bazaar? Should an arrangement be made with one man to supply the labourers on certain specified terms, or should any traders who wish to do so be permitted to open shops? If the supply of traders is for any cause insufficient, what steps should be taken to induce persons to open shops, or otherwise to provide for the sale of food, &c.? Where should the bazaar be located? Should the huts be erected for the traders at the cost of Government, or at their own cost? Should any supervision be exercised over what they sell (for instance, to exclude luxuries or unwholesome food), or over the prices at which they sell? and, if so, in what way? Should they be allowed to keep their shops open all the day, or only when the labourers are off work? - - - - - - - - - page 189.

14. HOSPITAL ARRANGEMENTS IN CONNECTION WITH RELIEF WORKS.

In what cases should a hospital be attached to a relief-work? What system of sanitary inspection of the labourers is desirable? How far should the sick be treated without being sent to hospital? If there is no hospital what arrangements should be made for those who fall sick? When a hospital is necessary, what should be the shape and material of the sheds, what space should be allowed to each patient, what clothing, bedding, &c., what provision should be made and what class of people entertained for cooking and nursing?

What professional supervision should be provided over the Hospital Assistant? What authority should be exercised over him by the Public Works Department officer, or the civil officer in charge of the work, if there is one? - - - - - - - - - - - - - - page 192.

15. RELIEF WORKS.—ADMISSION, CLASSIFICATION, AND PAYMENT OF APPLICANTS.

What system do you recommend for the admission of applicants for relief on works for securing that no hindrances are placed in the way of their coming, and no bribes taken for admission? How would you provide for classifying them and placing them on gangs? If payment is not made daily how would you arrange for their receiving advances till the first wage day comes round? And, if paid daily, what pay should be given to those who come on during the day and work for a broken period? - - page 196.

16. THE KEEPING OF REGISTERS ON RELIEF-WORKS.

What registers should be kept up of the number and classes of persons on the works, the numbers who are daily admitted, or who leave, the wages paid, the number punished by fine, the quantity and value of the work done? - - - - - - - - - - - - - page 200.

17. ORGANIZATION OF RELIEF-WORKS.

Describe the organization of a well-managed relief-work, the number of gangsmen and of labourers in each gang, of overseers over the gangsmen, of registering clerks and paying clerks or cashiers, and how the upper supervising staff is constituted. State also in what form, and at what periods, progress and other reports are sent up to higher authorities - - - - - - - - - page 201.

18. DISCHARGE OF LABOURERS FROM RELIEF-WORKS.

What arrangements would you propose for discharging labourers from relief-works when the famine is declining, or over, or when the work is closed? Has it been customary to give money to persons discharged to enable them to reach their homes and start again in their ordinary way of life? How have persons been dealt with who to the end continue in a physical state in which they are unable to support themselves?
page 206.

19. DESERTIONS FROM RELIEF-WORKS. MOVING BODIES OF MEN TO WORKS OVER LONG DISTANCES.

Has it been found that persons after admission to relief-works wilfully desert from them, and to what extent do such desertions commonly indicate excessive severity in the application of tests, insufficiency of food, or improper treatment of other sorts? Are they often due to other causes, and if so what? How should such results be guarded against? Under what circumstances would you recommend moving bodies of men to works over considerable distances? Should this ever be done as a preventive measure to weed out those who are not in absolute want of relief or only as a step that is expedient for the sake of transferring them from less useful to more useful work, or to admit of their being more easily fed or supervised, or to prevent sickness and the like? If the distance is more than one day's march, what arrangements should be made for hutting them for the night and for paying them or feeding them on the march? Narrate the history of any case within your knowledge in which more than 500 people were moved, or attempted to be moved, more than 20 miles, and state any difficulties the movement involved, and how they might best be avoided - - - page 210.

20. ASSOCIATION OF CIVIL WITH PUBLIC WORKS DEPARTMENT OFFICER ON A RELIEF-WORK.

Under what circumstances should a civil officer be associated with a Public Works Department officer in the management of a relief-work? What is the proper field of duties of the civil officer? What parts of the duties should be wholly under him and what parts should be entirely beyond his sphere? If it is proper for him in any way to interfere with or control the discipline of the labourers, the management of the camp and bazaar, the tasking, the measuring, and the payment of wages, state how this can best be done without undue friction and annoyance - - - - - - - - - - page 216.

21. THE REGULAR EMPLOYMENT OF ORDINARY IN CONJUNCTION WITH RELIEF LABOUR.

Besides the persons to whom employment is given with the special object of affording them relief, the Public Works Department usually employs on the works it carries out a large number of both skilled and unskilled labourers, who are dependent for their regular livelihood on the receipt of wages more or less all through the year. State how the continued employment of these may best be made compatible with relief labour if the works on which this class of men is employed are closed or turned into relief-works - page 221.

22. RELIEF-WORK FOR ARTIZANS, WEAVERS, &C.

Have you had experience of any kind of relief-work other than earth-work? If so, describe it. Has any attempt been made to employ artizans, such as weavers, smiths, carpenters, &c., in pursuing their own professions, and with what success? In the case of weaving or spinning when raw material is given out, and thread or cloth received back, is it best to pay the difference of price between the raw and the worked-up material, or to pay daily wages to the workers? State your views as to the best method of distributing the raw material and exacting a proper tale of work, and make any general suggestions on this subject that occur to you - - - - - - - - - - - - page 223.

SECTION 2.—GRATUITOUS RELIEF.

23. The Poor-house.

The commonest mode of administering gratuitous relief is through the poor-house. What is the proper situation for a poor-house so as to secure accessibility, discipline, space, water, and proximity to food supply? Is an enclosure wall or fence necessary, and of what should it be made? What total area is desirable in proportion to the whole number of inmates? What shape and material are best for the huts, and what sleeping space (in superficial area) should be provided for each inmate? How may they best be arranged with a view to ventilation, &c.? How should the latrines be placed and managed? What is the maximum number you would accommodate in one poor-house? How should the inmates be separated and classed together so as to provide for the requirements of caste, for the keeping of families together, and for the separation of the sexes in the case of persons who do not belong to families? - - - page 227.

24. Conditions of Admission to Poor-house Relief.

What should be the conditions of admission to relief in a poor-house? The usual conditions are (1) *inability to work on a relief-work;* (2) *willingness to reside within the enclosure;* (3) *willingness to accept cooked food. Under what, if any, circumstances may these be relaxed, or may the food be distributed without residence, or may uncooked food be given? What arrangements should be made for the admission of applicants, and to whom should the duty of selection be assigned?* - - - - page 236.

25. Compulsory Detention in Poor-house.

Under what circumstances does it appear desirable that entry into a poor-house should be made compulsory on persons who appear to be starving, or to be in such a state of want as to show that relief in some form is essential to the preservation of their lives? and under what circumstances would you allow them the discretion of refusing to submit to this? If compulsion is used to take them in, what steps are required to ensure their stopping there? How should such a rule be applied to vagrants, and how to persons on relief-works, or seeking relief otherwise? Does it appear necessary or expedient to obtain legislative authority for such action as may be desirable in these respects? If so, suggest what seems most suitable. Would there be any special objections to such legislation, having in view the risk of exciting fears in the population, or for other reasons? - - - - - - - - - - - - page 239.

26. Rations in a Poor-house.

What ration should be given to the ordinary inmates of a poor-house, and what special diet to those who are much reduced by innutrition? Have you any experience of the effects of the ration for adults which consists of 1 *lb. of raw flour with condiments? What is the proper quantity of condiments? State the results of your experience, as fully as possible, whether this ration has or has not shown itself sufficient to support life.* page 243.

27. Organization of a Poor-house.

Give as fully as possible your views as to the organization of a poor-house. State how the food should be purchased and stored; what stock register of it should be kept, and by whom; how given out to be ground; what the grinding task should be; how it should be received back and tested when ground; how given out to the cooking department; how information is to be given to the store-keeper or the head of the cooking department as to the number of rations required for adults and children, for ordinary, special, or sick paupers; in what way and in what vessels the food should be cooked; with how much water and fuel; what the weight of the cooked ration should be; whose duty it should be to test it; how it should be served out to the people; what discipline should be enforced among them while it is being served out and eaten. What precautions should be taken to see that it is eaten when received and not sold or exchanged, and that the children's portions are not taken from them by their parents or other adults? Under what circumstances should warm clothing be given, of what description, and at what probable cost per head? State what the rules of the poor-house should be as to the hours of rising, ablution, calling the roll-call, distributing food, going to and returning from work, and going to sleep. What arrangements should be made for personal ablution and washing clothes? What supervision is necessary to separate and take in time to hospital those who begin to sicken, or to distribute medicine to such as require it but are not sick enough for hospital? State what work the paupers can be set to, what is most suitable, for what cases, and how labour is to be enforced. What establishment is required (per hundred paupers) for cooking, grinding, sweeping the enclosures, cleaning the latrines, maintaining discipline, fetching water, or wood or grass for thatching, removing the sick to hospital, or carrying out and burying the dead? To what extent may such duties be performed by the stronger of the paupers, and in case suitable persons cannot conveniently be obtained from among them, how should the necessary establishment be paid? What amount of general supervision is necessary? What registers should be kept up as to cash outgoings, stores in stock and issued, daily number fed, and daily expenditure of food, sickness, and death? page 252.

28. Poor-house Hospital.

Refer to the questions regarding a hospital attached to a relief-work, and consider how far the arrangements suitable for such an establishment would also be applicable to a hospital attached to a poor-house. If any difference of system seems desirable, state in detail what seems requisite - - page 271.

29. Drafting of Inmates of Poor-house to Relief-works.

What system would you pursue for drafting into a relief-work those inmates of a poor-house who recover strength and health there and become fit for labour? - - - - - page 274.

30. Relief of Parda-nashin Women.

There are two classes who ordinarily receive gratuitous relief without being inmates of poor-houses. The first is parda-nashin, or gosha, women. What test can be applied to prove their necessity? Would you inquire into their cases through an official or a non-official? Supposing they have hitherto been dependent on a person who now refuses to support them, would you admit them to relief, or require him to support them if he is able to do so (1) *if they have close natural ties to him,* (2) *if they have not? Supposing the necessity of relieving them to be established, how would you relieve them, with money or food, or by giving work, such as cotton to spin, or grain to grind? How often should this relief be given, and in what quantity? When, and under what circumstances, should this relief cease? Have cases occurred in which dependants of persons in easy circumstances have claimed or obtained relief, and how have such cases been dealt with?* page 275.

31. Village Relief of Infirm or Sick.

Another class consists of the sick, infirm, cripples, and bedridden folk, in towns or villages, who cannot leave their homes. How would you organize a system for relieving them? How inquire into and ascertain their cases? How convey relief to them when they are put on the registers, and what relief should it be? When should relief of this kind be closed? - - - - - - - - page 280.

32. Orphans and Deserted Children.

What has been held to be the duty of Government in respect to orphans or deserted children, and what appears to be the correct principle to follow? What number of such children have been thrown on the State during the recent famine? What arrangements have heretofore been made for receiving and supporting them, and what has been their ultimate destination? What have been the practical results of the measures thus taken in the past? What appears to be the best system to adopt in the future? - - - page 285.

33. Purchase of Grain by Government and Sale Below Market Rate.

Another form of relief, independent of a labour test, is by purchasing grain and selling it at or below cost price, and consequently below the retail market rate. Was this measure resorted to in your district, under what circumstances, and with what results? Do you consider that there are any conditions under which it is proper for Government to have recourse to such a step? (*This question does not refer to the propriety of Government importation generally, but of importing or purchasing in order to sell cheaper than the market rate*) - - - - - - - - - - - - page 288.

SECTION 3.—MISCELLANEOUS.

34. Proportion of Persons Relieved to Whole Population.

State as nearly as practicable the proportion that the whole number of persons that were in receipt of relief in any form in your district on a selected day, or on the average of some week, when the recent famine was at its height, bears to the whole population. Of the whole number so receiving relief, what were the proportions under the following heads:—

1. *On relief works* - - - - -	*Adult males.* *" females.* *Children.*
2. *Artizans specially employed* (*if any*) *as such* - -	*Adult males.* *" females.* *Children.*
3. *In poor-houses* (*resident*) - - - - -	*Adult males.* *" females.* *Children.*
4. *Relieved non-resident (para.* 30) - - - -	*Adult males.* *" females.* *Children.*
5. *Relieved in villages (para.* 31) - - - -	*Adult males.* *" females.* *Children.*
6. *Others, not resident* - - - - - -	*Adult males.* *" females.* *Children.*

page 293.

35. Emigration.

Has Government ever attempted to organize emigration, permanent or temporary, from districts suffering from famine to other parts of India, or foreign countries, as a relief measure? If so, with what success? Under what circumstances could any such emigration be organized or encouraged? To what extent has emigration been resorted to by the people voluntarily? Have any gone beyond sea? Have any permanently gone off to settle in other parts of India? How many (*approximately*) *left their district on a temporary expedition to search for food or employment elsewhere during the recent famine? Did they go alone or with all members of the family, and with their cattle and property? Where did they go to, and were their hopes of alleviating their distress realized? How many* (*approximately*) *have not come back, and how many are supposed to have died?* - - - - - - - - page 297.

36. THE CONTROL OF AIMLESS WANDERING.

If famine-stricken people begin to emigrate to a part where it is known they would not find things better than in the country they left, or if they wander aimlessly from their homes, settling nowhere, should steps be taken to stop this, and how? Would you employ the police under any circumstances to turn them back, or to compel them to go to relief-works or poor-houses? or would you let them learn by their own experience? If they crowd into a town, say the head-quarters of the district or the province, would you do anything to stop them on the way, or to prevent their begging and straggling about the town when they get there? Refer to paragraph 25 in answering this question, and add anything that seems requisite in relation to the points now raised - - - - - - - - - - - page 304.

37. REMISSION AND SUSPENSION OF THE REVENUE DEMAND.

Is it a recognized feature of the Revenue administration in your district to give relief by the remission or suspension of the demand for land revenue when the crops fail? If there are any established rules, quote them. Is the land revenue assessment based on the principle that profits of good years should cover losses in bad years? Is it assumed that a sufficient margin of profit is left to the landholders to admit of the regular payment of the revenue under all vicissitudes of season, or only in the ordinary fluctuations that occur, excluding seasons of extreme drought? What is the practical state of the case? How far is it found to be possible to collect the land revenue in a year when the crops have totally failed, without pressing unduly on the landowners? What amount of failure of crops is held to justify what amount of leniency in collection? Where the occupier of land pays rent to a landlord, how is the payment of such rent affected by failure of crops, and to what extent does the remission or suspension of land revenue lead to corresponding treatment of rent? What are the arguments in favour of giving relief in the form of remission or suspension, respectively? To what extent has it been customary in actual practice in your district or province to remit or to suspend in such cases? Up to what limits do you consider that it is practicable to recover in future years the postponed demand of bad years, or does suspension practically mean remission in all but a few cases? - page 307.

38. VILLAGE INSPECTION. DISINCLINATION TO SEEK RELIEF.

Is the duty of searching out distress in time of famine in the villages and the people's homes one that properly belongs to Government, or is it sufficient for Government to offer means of obtaining relief, and to expect that the famine-stricken will come of themselves and make use of those means? If it is proper to depute special officers to inspect villages and urge the people to accept the relief offered, what steps do you consider necessary for strengthening the ordinary district staff and enabling them to carry out this duty? What class of officers should be selected for such duties, and what areas assigned to them? May these officers best be servants of Government, or should they be taken from the non-official class? What should be their precise duties, and what supervision should be provided to see that they carry out those duties? At what period may it become expedient to organize such an extra famine establishment? To what extent, and under what general circumstances, has there been any tendency on the part of the people in distress to reject measures of relief offered to them? Where determined disinclination has been shown by any portion of the population to leave their villages and go to relief-works or poor-houses, what has been the probable cause of such a state of things? Can it be traced to improper arrangements for the reception of applicants for relief, or for admitting them to employment on works, to an insufficient allowance of food, or wages, or to any such causes? Can any other causes be named which may have conduced to the disinclination to seek relief, such as physical prostration, or habitual want of confidence in officials, &c.? - - - - - - page 318.

39. EXPEDIENCY OR OTHERWISE OF STORAGE OF GRAIN BY GOVERNMENT.

Did you in the recent famine lay in any stores of Government grain for the purpose of feeding labourers or inmates of poor-houses? Was anything done to stimulate trade by offering advances of money or any kind of assistance or bonus to merchants? Did the Government purchase grain, import it, and sell it again to the general public with the object of keeping the local markets supplied? If any such measures were taken, state the circumstances under which the transactions occurred, the reasons which led you and your superior officers to think them necessary, the manner in which grain was purchased and imported, the quantity, cost, and price at which it was disposed of, and the monetary gain or loss realized; or the nature of the advance or bonus given to traders: whether it checked private imports; also the general effect of the whole transaction. If you did not take any such step, do you now consider that it would have been better to do so? If you did it, or it was done, do you think any error was committed in so acting? And generally what are the conditions under which such measures are proper and necessary? - - - - page 327.

40. ABILITY OF THE ADMINISTRATION TO COPE WITH FAMINE EMERGENCIES.

Do you consider that the events of the last famine have shown that the system of civil administration in your district is strong enough to bear the unusual strain laid upon it, or that any defects have been discovered which might be obviated? Is the area of your district too large for one man to supervise, or of a convenient size? Are your official relations with the officers of the Public Works Department in your district such as are most conducive to the carrying on of relief work? What staff of civil officers have you to carry out your orders, and what duties and responsibilities attach to each? Is that staff of the proper strength and organized in the best possible way, or can you suggest any improvements? Have your native subordinates as a class shown energy, capacity, humanity, and physical activity in carrying out relief measures, or have they been wanting in these qualities? Give a general outline of the manner in which the relief operations in your district were conducted. To what extent did your control go, to what extent was there local independence of action? How was the chain of responsibility maintained between the superior and subordinate officers? How far were you yourself controlled in the relief administration, and how far left to act on your own discretion?
page 335.

41. SYSTEM OF CORRESPONDENCE AND CHAIN OF OFFICIAL RESPONSIBILITY.

Through what channels have orders relating to famine relief reached you from the Government? If references were sent by you, and orders received by you, from the Government or its representative in the

Famine Department direct, state whether you think that course operated well, whether the necessary business was rapidly conducted with consistency and precision, and with due attention to the exigencies of special circumstances and localities, &c.? Do you think this course best, or that the work would have been more effectually done had there been an official (whether Commissioner or Member of the Revenue Board, or by whatever name called) who should have been in administrative charge of a group of districts, and would thus have become acquainted with their wants and circumstances by personal inspection? If, on the other hand, you received the orders of the head of the Government through any intermediate authority, state if, in your opinion, there were any disadvantages attaching to this course, such as weakening the sense of personal responsibility in the local executive officers, delay in replying to references, or want of uniformity of method in different parts of the province, and so forth? - - - - - - - - page 346.

42. Financial Control and Audit of Expenditure.

Under what financial control were the operations placed as to the supply of funds and authority to spend money, or sanction and commence works? State generally the system adopted, and what you think of it? Mention if any irregularities or frauds took place in the application of money, or were supposed to have taken place, and how and to what extent? Is it anywhere currently reported that any persons of any class engaged in the relief operations have become subsequently enriched, or is there reason to think that peculation or malversation were rare and exceptional? Were sufficient means available for checking the expenditure and rendering and auditing the accounts? How was this part of the operations conducted and with what general results; has the whole of the outlay been satisfactorily accounted for or not, and if not, what deficiencies have arisen and in what manner, and how have they been dealt with? - - page 349.

43. Proper Field for Private Charity in Various Stages of Famine.

What do you consider the proper field for private charity in the beginning, at the height, and in the decline of a famine? To what objects should it be applied, and through what channels? Should the funds be expended by Government servants who are also at the same time carrying out relief measures? Should they be expended in saving life and giving food? or should that be left entirely to Government, and the charitable funds confined to other objects, such as setting people up again in their pre-famine position, starting them again with a little capital, and thus assisting them with appurtenances which, though not luxuries, are not absolute necessities of life? - - - - - - - - - page 353.

44. After Effects of Famine on the Country.

What has the effect of famine been in your experience on the subsequent condition of a district? Where villages were deserted have they been permanently depopulated, or has the population returned to them? Has much land been thrown out of cultivation, and for how long has this decrease in the cultivated area continued? Has it been due to want of cultivators, of plough bullocks, or of capital and of seed grain? - page 355.

45. After Effects of the Recent Famine.

In the case of the recent famine what effects, such as those just referred to, have been produced? How many villages have been deserted, how many have been seriously affected; what is the reduction in the area under cultivation now compared with what it was two years ago? How many holdings have been abandoned? Have the landlords, or ryots with whom the settlements are made, been permanently impoverished in a serious degree? Is there any reason to anticipate increased difficulty in realizing rents or land revenue for the next few years by reason of the recent pressure, if the seasons are favourable? What proportions of landlords or ryots are likely to be dispossessed of their holdings through the action of the Revenue or Civil Courts, as a consequence of distress produced by the famine? Has the agricultural population, which has no beneficial interest in the land, suffered more in proportion than other classes? - - - - page 358.

CHAPTER IV.

FAMINE PREVENTION.—PREPARATION OF SCHEMES OF WORK FOR FUTURE USE.

1. Practical Use of such Schemes.

After 1868 *the Government of India gave instructions that schemes of works should be prepared, suitabl for execution in the event of famine. Were such schemes ever prepared? If so, have they been found o practical use during the recent pressure?* - - - - - - - - page 362

2. Difficulties of keeping them up.

Do there appear to be any difficulties in the way of keeping up such schemes in a form which will be really useful in the future? - - - - - - - - page 364.

3. Class of Works to be included.

What classes of works would be included in them? Would the works differ in character from the ordinary works of utility brought forward for execution from time to time? And, if so, how? Give a practical example of works now considered suitable to be taken up as elements of such a scheme in two or three districts, if possible - - - - - - - - page 367.

4. Authority for their Execution.

Should the works in such a scheme be looked on as immediately available for giving employment as relief works at the discretion of the local Governments, or under what circumstances might the authority of the Government of India be held to be required? - - - - - - page 375.

5. Responsibility for their Maintenance.

If severe drought, calling for the employment of labour on a very large scale, and in an exceptional manner, occurs at comparatively long intervals, how will it be best practicable to arrange for suitable projects, which, though suspended, must yet be fit for early execution? On whom should the responsibility of maintaining such schemes in an efficient state rest, and how could it be enforced? - - - page 376.

6. Their Relation to Numbers requiring Relief.

What number of persons is likely to be thrown on relief works in an extreme case, and how should such a scheme be framed as to indicate what portions of it should be taken up on any particular occasion in order to provide for the employment of the anticipated numbers and for the length of time required? - page 378.

7. Should they include Works of doubtful Financial Value?

Should the works include only such as had been sanctioned for construction under the regular rules on such subjects, or would it under any circumstances be right to include in such a scheme large works to which sanction had not been given on account of their doubtful financial value, and their not being of a character that would justify their execution under ordinary circumstances? How far might there be risk of the Government being led into unprofitable expenditure in the completion of works of this sort begun under plea of famine pressure? - - - - - - - - - - page 385.

8. Value of Unskilled Labour during Famine.

Is it probable that the amount of work executed by unskilled labour on any large work during the pressure of famine would be such that the exclusion of the expenditure on it would reduce the ultimate cost of such a work in any important degree, so as to be likely to render it remunerative, though if otherwise executed it would not have been remunerative? Can any illustration be given of such a case as that last referred to? - - - - - - - - - - - page 387.

9. Should large Works not sanctioned by proper authority be included.

Could large works not sanctioned by proper authority, for whatever reason, be properly included in the scheme of works, and if so, what preliminary steps should be regarded as requisite before actually putting them in hand if severe scarcity arose? - - - - - - - - page 390.

10. Risks attending Absence of prepared Schemes.

Considering the circumstances under which labour is applied on relief works, is the risk of waste by reason of there being no regularly prepared scheme ready really great? Is there danger, in the absence of suitable projects ready for immediate execution, of the suffering population being left without proper relief until the necessary relief works have been prepared for execution? How far might the intelligent action of the several branches of the Public Works Department be made to supply, from among projects in course of execution or ripe for it, what was requisite? Could this end be sufficiently secured by distinctly making the Public Works Department responsible for bringing forward suitable works whenever pressure from scarcity arose; and, so far as was necessary and practicable, setting aside or postponing the ordinary work not suitable for relief purposes? - - - - page 392.

11. Difficulty of finding suitable Relief Works.

Has there been practical difficulty in finding suitable relief works during the recent pressure? If so, where and how? Make any suggestions on the subject of providing relief works which may aid in meeting the difficulties that are found to arise in practice - - - - - - - page 396.

IRRIGATION WORKS.

12. Cost of Construction and Maintenance. Area Irrigated and Value of Crops.

What is the capital expended to date in the construction of the principal canals in your province, and what the yearly interest on that capital? What is the annual cost of maintenance? What is the present acreage irrigated? From this calculate the several corresponding rates per acre. What is the average local value per acre of the chief crops raised by irrigation from these canals? What is the difference between this and the average value of such crops raised without irrigation? - - - - page 400.

13. Water Rate and Increased Rent, Revenue or Owners Rate.

What is the amount per acre paid for the use of water for the chief crops by the occupier in the shape of water rate? What is the ordinary increased rent on irrigated over unirrigated land? What is paid by the proprietor per acre in the shape of land revenue or owner's rate? Is there any reason why a proprietor, whether paying land revenue or not, the yearly value of whose lands is increased by irrigation from canals constructed and maintained at the public cost, should not contribute to the State in return for the advantage he thus obtains? What seems to be the best way of obtaining such a contribution from him, first, where the land revenue is liable to revision; secondly, where it has been permanently settled; and thirdly, where the land is not charged with revenue? - - - - - - - - - - page 410.

14. Collection of Canal Dues. Distribution of Water.

In what way, and under what law, are the canal dues recovered in your district? Has there been found to be any difficulty in applying the law in any particular, and if so, how? And what better system can be suggested? It is commonly said that water is used in too lavish a manner by agriculturists when the charge is made on the irrigated area, or otherwise than by the quantity supplied. Is this the case, and what remedies can be applied? Will raising the water rate have the effect of preventing this? To what extent is this likely to have a tendency to throw the poorer crops out of cultivation, or to confine irrigation to the more paying crops? Is water charged for by quantity, and can this be done? Is it ever charged for on a contract system, a whole village or the proprietors or cultivators of a certain portion of the village lands paying a lump sum periodically for the water supplied to those lands through a given aperture? Is this system a good one? What are the difficulties attending it? Where it is adopted what arrangement is made for distributing the water among the cultivators? Have complaints practically arisen where the system has been in force, and how could they best be guarded against? Does there appear to be any objection to making such a system of contract compulsory where the general advantage of the cultivating community calls for increased economy in the use of a limited supply of water? - - - - - - page 419.

15. Water Rate in relation to Cultivator's Margin of Profit.

Having reference to the margin of profit on irrigated crops commonly left to a cultivator after payment of the existing water rates, could these rates be increased without trenching unduly on that margin of profit? How would raising the water rates operate on a cultivator under a lease, and how on the revenue-paying proprietor, if it took place during the currency of the lease or settlement respectively? - page 425.

16. Preparation of Statistics.

How are the statistics of irrigation recorded, and are revenue reports of the chief irrigation works prepared by the canal administration, and in what form? Do you think them necessary? To what extent do you think the record of such statistics valuable or necessary for the proper administration of irrigation works? To what degree of detail may the record usefully go, and how may the facts be best collected and recorded? - - - - - - - - - - page 428.

17. Some mischievous Effects of Canal Irrigation.

What evidence is there as to any mischief being caused by canal irrigation, such as by increasing sickness, or injury to the land by raising the water level, or production of efflorescent surface salts, &c.? To what extent has drainage accompanied, or ought drainage to accompany, canal irrigation? Has the provision of needful drainage been neglected? Is additional drainage needed to meet the effect of the increased quantity of water thrown on the surface, or to remove obstructions caused by canals, channels, water-courses, &c.? - - - - - - - - - - page 430.

18. Purification of Soil.

Has canal irrigation anywhere been combined with attempts to improve soils previously unfit for cultivation from the presence of noxious salts? - - - - - - page 433.

19. General Effect of Irrigation on the Character of Cultivation.

What has been the general effect of continued canal irrigation on the character of the cultivation? Has the irrigated area of the poorer grains, which supply the chief part of the food of the people, been gradually diminished, and has the area of the better crops been increased? If the area of poorer crops has been reduced, is this due to conditions of soil or position of lands and difficulties of access from the water supply, or to the relative profits in the one case being greater than in the other? State the general facts as *to the changes in the areas irrigated during the last* 10 *or* 12 *years, and make any comments that seem desirable. Is there reason to suppose that prolonged irrigation damages the land under any circumstances? Is there any evidence of a reduced production?* - - - - - - page 434.

20. INUNDATION CANALS AND WELLS.

Under what conditions is an inundation canal, giving water only during the rainy season, found to be useful? To what extent is it probable that such irrigation could be usefully attempted in the North-Western Provinces, or elsewhere where not now applied, and where a water supply is available? How far would such irrigation be useful for rabi or kharif cultivation? How far may wells be depended on to supplement the deficiencies of supply in such a canal during the dry season? - - - page 440.

21. CANAL ADMINISTRATION.

What is the system of canal administration? Who is responsible for distributing the water and for collecting the dues? May the functions of the engineer in charge of the works and the technical business of the water supply, and those of the officer responsible for seeing that the available water is distributed equitably to the land that most requires it, and securing water to the extension of irrigation and the realization of the canal revenues and their due assessment and increase, be best combined, or should they be kept separate? State the reasons for your opinions - - - - - - - page 442.

22. CANAL ADMINISTRATION.

What system actually prevails in your province, and if you think it susceptible of improvement, say how? Do you think a special canal law necessary to admit of proper administration? And have you such a law, and is it satisfactory? - - - - - - - - - page 442.

23. SLOW EXTENSION OF USE OF CANAL WATER.

Why has the extension of the use of canal water been commonly so slow? What has been the nature of the obstacles, and how can they best be avoided or removed? Are any of the canals now in an unsatisfactory condition in these respects, and can any sufficient explanation be given of the want of progress? This question would specially apply to the Orissa canals, and to the works of the Madras Irrigation Company, with reference to which last see question No. 30. *Have any of your canals practically reached the state in which any further extension is not likely, or is likely to be small? Say how far this is the case in each. Are difficulties met with in preparing land for irrigation for the first time, in the way of subdividing fields, or levelling the surface, or formation of water-courses, which require more time and money than can be supplied by a limited population otherwise than slowly? If such difficulties are met with, how may they best be removed? Does the existing system provide sufficiently for making advances to cultivators to adapt their land to irrigation, and if not, what changes are desirable? Does shortness of supply during the hot season materially affect progress of canal irrigation?* - - - - - page 449.

24. MODE OF MEETING CHARGES ON UNREMUNERATIVE BUT NECESSARY WORKS.

Where the financial prospects of projected irrigation works are not such as to appear to justify the outlay of public money on them, in the expectation of the income being at an early date sufficient to cover all the expenses, including the charge of interest on capital outlay, do you think that a special rate to make good the deficiency might properly be charged on the district for the benefit of which the works are designed, or on the land that would be protected, and if so, under what conditions? If not, what are your objections? How would you meet the case put in this question if not by some such special rate? Is it more equitable to place a compulsory charge on other districts, which can probably derive no advantage from the works, or only on the districts or lands that can benefit? If the protection to be given by such works to particular districts is deemed of great importance, under conditions such as have been above stated, what course do you think should be taken, having regard to the necessity for protecting the general finances of the country? page 454.

25. EXISTENCE OF CUSTOMARY CLAIMS TO USE OF WATER.

Have any customary claims or prescriptive rights in the use of water from tanks or canals or water-courses grown up in your district? What is their nature and history? Have they led to inconvenience in respect to the general utility of such works to the agricultural community that might benefit by them? Would it, in any case that you know, be desirable to buy out such rights as exist, and to prevent the accretion of others? Have such claims or rights to the use of the water in the upper parts of rivers obstructed the application of the water in the lower parts to purposes of irrigation, or vice versâ? If this has happened in any case, could any remedy be applied which would be equitable? How should disputes on such points be settled? In cases in which the action of the ordinary courts would be impossible or inapplicable, what principles should govern decisions in such disputes? - - - - - - page 459.

26. MAINTENANCE OF CERTAIN WORKS BY CULTIVATORS.

If anywhere it be found that the tanks, &c. are so small and numerous that Government cannot practically carry out their supervision and maintenance, would it be expedient that steps should be taken for imposing on the cultivators or proprietors who benefit by the water the duty of carrying out all necessary repairs or works for securing the irrigation in an efficient condition? Do you think this principle should apply to all tanks, great and small alike? Might the obligation equitably be held to attach without any corresponding relief being given, or should any privileges (such as lowered rent) be conceded to the ryots, if they are charged with the duty of repair? To what extent should the liability go, whether only to minor works not requiring engineering skill, or to all work? How could such a duty be best enforced, and any neglect of repairs checked at its inception? And what penalties should be legalised to punish such neglect when it does occur? Is there any local or other fund from which to pay for such work if it consisted of more than ordinary earth-work? Could such a fund, in case of need, be established? - - - page 464.

27. OBLIGATION OF ZEMINDARS TO MAINTAIN TANKS, &C.

How far do obligations rest on zemindars or other superior landholders to maintain tanks or other irrigation works? Are such obligations properly recognized where they exist, or is any additional power called for to enforce them? Where they do not now exist, are there circumstances or localities in which it would be expedient to impose them on some such basis as that referred to in question No. 26, *and if so, on what general system should it be done?* - - - - - - - - page 469.

28. MADRAS ACT NO. VII. OF 1865 (WATER CESS).

What are the rules made under Madras Act No. VII. of 1865? *Give a statement of the works to which this Act has been applied, and what is the revenue realized by means of it? Give an illustration of the cases in which exemptions are granted under section* 4 *of the Act. What is the nature of the receipts entered in the Miscellaneous Land Revenue under the head "Cess for repair of tanks?"* - - page 471.

29. DISTRIBUTION OF WATER WHERE SUPPLY IS DEFICIENT.

How has the distribution of water been fixed where the supply is less than the demand? Do customary or other established rights interfere with the extension of irrigation from any Government canal, and if so, where and to what extent, and what remedy should be applied? Is it the duty of anyone to see that the available water is made use of to the best possible advantage for the community as a whole, and on whom does the duty fall? Is there any difference in the system of supplying canal water to lands under ryotwari settlement and under zemindari settlement, where the two exist, and what is it? - - - page 472.

30. MANAGEMENT BY PRIVATE AGENCY.

Is there any special difficulty introduced into the spread of irrigation by the intervention of the agency of a company in the management of a canal, and how could such difficulties be best overcome? - page 473.

31. DIRECT AND INDIRECT RETURNS.

In reckoning the return obtained from the outlay on canals or other irrigation works, is full credit given them under the existing system of accounts? Where separate water rates are charged on the cultivators, is the indirect profit obtained by the increase of land revenue properly taken into account? Where there has been no distinction made in the payment to Government between the charge made as land revenue and that for the supply of water, is the canal revenue fairly estimated at present, and if not how do you think it would be best reckoned? - - - - - - - - - - page 474.

INDEX OF EVIDENCE IN REPLY TO INQUIRIES OF THE FAMINE COMMISSION.

Name.	Office.	Experience.	—
PUNJAB.			
Mr. A. H. Benton	Officiating Deputy Commissioner, Karnal.	No famine experience. Scarcity, Karnal, 1878.	II.—Q. 1, p. 2. Q. 2, p. 12. Q. 5, p. 26. Q. 6, p. 43. Q. 7, p. 63. Q. 9, p. 71. Q. 10, p. 77. Q. 11, p. 80. III.—Q. 26, p. 243.

LIBRARY OF THE BOMBAY BRANCH OF THE ROYAL ASIATIC SOCIETY

CHAPTER II.—REPLIES.

QUESTION 1.—INDICATIONS OF APPROACHING DISTRESS.

How does distress consequent on drought first make itself felt among the people, and how is it first brought to the notice of the district officers? What are the indications by which the district officer would judge whether the distress is due to temporary or local scarcity, or is likely to be the forerunner of very severe general distress ending in famine? What steps should be taken to ensure that such indications are brought to his notice? To what extent does the existing district organization suffice to ensure early and trustworthy reports, and if not sufficient, what other measures are suggested as requisite?

Punjab.—7 officers have answered. The purport is the same as for Bombay. The district organization is considered sufficient by the majority.

North-Western Provinces.—30 officers have answered the question.

The purport of the replies is similar to that of the Bombay answers.

Bengal.—17 officials and others have answered.

The views as to the way in which distress shows itself do not much differ from the foregoing. As to the sufficiency of existing district organization, opinions differ, but in some cases the opinion is very strongly expressed that it is quite insufficient. The police are the agency for supplying information, supplemented by a large non-official class. Agricultural and trade statistics are wanting.

Bombay.—12 officers have answered the question.

The substance of their answers is—

Distress shows itself first by a rise in prices and simultaneous decrease of employment for labour.

It comes to the notice of the district officers by personal observation and from the reports of the village and taluka officers, and returns of prices and rain-fall, and of crime.

The district officer would judge whether the distress is temporary by considering the time of the season at which it begins, the condition of crops in adjoining districts.

He would cause all subordinate officials to travel in their charges, and report periodically, and, if needful, would himself make a tour of observation. The existing district organization is considered sufficient.

Madras.—21 European and 4 Native gentlemen have furnished replies, the general tenor of which is as follows:—

Distress consequent on drought first makes itself felt amongst the poorer classes by the enhancement of prices, the scarcity of drinking water for man and beast, the contraction of the labour market consequent on the suspension of agricultural operations, and a difficulty in negotiating the petty loans which in favourable years the village money-lenders are in the habit of granting on the security of the season's crop.

The district officers are first apprised of the condition of matters by the reports they receive from their subordinates stationed in different parts of the district of the state of the crops and season, by the rain-fall and price returns, and by petitions from the smaller landholders praying for a remission of the Government assessment. It does not, however, follow that because prices have risen, and the labouring classes experience difficulty in finding employment, that anything in the shape of a famine is to be apprehended. In many cases the distress is merely local, and may be traced to the failure of the crops in the vicinity, and will disappear with the next rainy season; but should this prove unpropitious, and inquiries show that the surrounding districts are similarly affected, if prices continue to rise throughout the country, if the markets generally are not so plentifully supplied as usual, if the police returns show an increase in crime, if there are panics in the bazaars leading to the closing of the grain dealers' stores, it will be reasonable to conclude that distress is becoming general, and will be followed by famine more or less intense according to circumstances.

So far as Madras is concerned there is a general unanimity of opinion that the existing district organisation is sufficient to ensure trustworthy reports of imminent distress and possible famine.

Central Provinces.—Mr. G. J. Nicholls, C.S., who has been employed in various capacities in the Central Provinces since 1865, and Surgeon-Major J. F. Barter, the Sanitary Commissioner, whose services in the Provinces extend over a period of 14 years, were selected by the Chief Commissioner to reply to the questions circulated by the Famine Commission.

The replies to Chap. II. are from the pen of the former officer.

Mysore.—9 European officers have replied to this chapter of questions. The summary made of the Madras answers is applicable to these replies.

The evidence of Colonel Sankey, Major Moncrieff, Colonel Johnson, and Mr. Ricketts has been selected for publication.

PUNJAB.

CH. II. QN.
PUNJAB.

Captain Wood.—I believe that the official reports of the present *tahsil* agency, together with intercourse with the leading men of the sub-division, were sufficient to furnish me with reliable information with regard to the state of the sub-division.

Lieutenant-Colonel Parsons.—(*a.*) Distress consequent on drought first makes itself felt among the people in increase of price of necessaries of life; the poorer classes, village menials and labourers being unable to provide sufficient food for themselves and families, itinerate in quest of charity. In Gujrat the distress has been chiefly among immigrants from the famine-stricken Jummoo territory, and its indications, the daily arrival of paupers seeking employment and charities at the larger towns and villages, principally in the Gujrat *tahsil.* (*b.*) Earliest indications are afforded to the district officer by reports of *tahsil* and police officials.

(*c.*) In this province all instances of distress are owing to temporary or local scarcity, the probable extent of distress being estimated by severity of the drought, and condition of the people with reference to immediate preceding harvests. (*d.*) The existing district organization has, in the writer's experience, been practically sufficient for obtaining early information in regard to distress, reports being made by *tahsil* and police officials; but it would seem advisable that distinct specific instructions should be circulated for general adoption to secure early reports at sadr head-quarters, and also to Government.

Mr. Roberts.—Distress consequent on drought first makes itself felt by the rise of prices which always takes place in anticipation of the failure of the ensuing harvest, and in this district last year it was first brought to my notice by petitions pouring in from all parts for grants of money for the employment of agricultural labourers and other village servants upon village tanks. This was soon followed by a remarkable increase in offences against property, and by migration from the villages in search of employment, or of pasture for cattle. It is impossible at the beginning of a bad season to judge from the circumstances of any one district whether the famine is likely to be partial or general, as everything depends on the extent of country over which the drought prevails, and on the rainfall of succeeding months, which cannot be estimated beforehand. The failure of one crop, though it will cause a rise of prices, and consequent privation to the poorer classes, will not produce an actual deficiency of food grains; but the failure of two or three harvests in succession, or the total failure of one followed by deficient out-turn in several, will necessitate imports, and absolutely deprive many thousands of the poorer agriculturists, proprietors as well as tenants and labourers, of the means of purchasing, unless they are saved from destitution by timely suspensions or remissions of the land tax. The district officer can best form a forecast of the future by noting the meteorological reports and crop returns of other districts and provinces of India. The *Zaildár* system, introduced with the new settlement, is well adapted for securing the necessary information of the condition of a district, and when it comes into regular working, will, if properly utilized, ensure an early supply of trustworthy information.

Mr. Benton.—From what I have said elsewhere it will appear that I consider something altogether beyond district organization necessary to secure the information requisite for dealing with distress or famine, inasmuch as local distress is nowadays so much influenced by scarcity or plenty elsewhere. To speak, however, of district organization, I think that the utmost attention should be given to securing correct information as to the out-turn of each crop, by determining the exact area under each crop; and the proper average produce to be employed for bringing out the out-turn. This is a laborious work, and the Patwári is the chief agent for performing it. During settlement he has no time or opportunity of attending to it. One half of this district will be seven years under settlement, and the other half may be as long in addition. During all this time this important work must be more or less neglected under present arrangements. I think that provision ought to be made for its performance at all times. Further, distress adds to mortality; and the present mortuary returns, except perhaps for the towns, are so untrustworthy as to be useless except for the sake of making a guess by comparing the untrustworthy returns of one period with those of another. I think in the Punjab the *Chaukídárs'* rules should be altered so as to enable a *Chaukídár* who could read and write to be appointed for the purpose of reporting vital statistics for a circle of villages. This would secure accurate returns at small cost. At present the returns are not submitted through the Deputy Commissioner, but he might obtain perusal of them from the police before they are sent in. A yearly return showing results for each week or month for each locality should be published by the Sanitary Commissioner, to enable comparisons to be made if it were suspected that mortality was due to distress.

NORTH-WESTERN PROVINCES AND OUDH.

NORTH-WESTERN PROVINCES AND OUDH.

Mr. A. Colvin.—By high prices and difficulty of getting food or labour. It is brought to the notice of district officers by their own observation of the changes coming over the people's habits, by petitions addressed to them, by the people asking for employment, and by the reports of their subordinates.

The indications I should look to are the more or less general area of drought, or the severity of drought and the character of the season in neighbouring districts. Information as to rain-fall, area sown, area in which seed is germinating, stocks, and state of imports will give him the information he wants. The existing district organization is good, but statistics as to quantity of out-turn might be improved.

Mr. Sandys.—Distress consequent on droughts makes itself felt, and is brought to notice by the influx of hired labourers into the larger towns, by the state of destitution to which the poorest amongst the weavers and others of the artizan class are reduced in the towns, by the numerous complaints against the grain merchants of refusing to make the customary advances for food, by the increase in the number of cases of thefts and gang robberies of any edible articles, and by the frequent complaint that the export of grain from villages had been opposed by the villagers.

Whether the distress is temporary or is likely to end in a famine depends on what the out-turn of the last crop has been, what the prospects of the ensuing harvest and the state of the stocks are throughout the district, the province, and adjoining provinces.

The district officer's local knowledge as to the out-turn of the last crop and prospects of the next harvest, the weekly weather and rain-fall reports published in the Government Gazette, and the prices current are the best guide the district officer has as to whether the drought will result in distress only, or end in famine. The rain-fall reports might easily, and with advantage, be published up to a much later date than they are at present.

Mr. Kennedy.—The first economic effect of a drought is to restrict the circulation of capital and credit. Among the agricultural community more than three-fourths of the total population is engaged in the actual cultivation of the soil. The principal economic feature in all agricultural communities is the necessity of a large outlay of capital in advance, and the slowness with which it repays itself. All agricultural communities are therefore large borrowers; but while the agriculturists in the more advanced countries of Europe require to borrow capital only for the actual working of their farms, the Indian cultivator needs to borrow for his own subsistence. He thus forestalls yearly the greater part of his crops. Should the prospects of the crops fail, he must fall back on his own resources. The severity of the famine depends so far as the agricultural community are concerned upon the amount of capital which the cultivator has saved, or the amount of credit which he can command, notwithstanding the failure of the year. The proportion which this class bears to the rest of the cultivating population will be the main factor deciding the fate of the district. If the agricultural community as a body can bear the pressure, the district will speedily recover its former prosperity, but if it cannot, the district must become demoralized.

All other classes of rural community depend upon the agricultural class, and although the poverty of these subordinate members of rural society makes distress to be first visibly felt among them, the distress is due to the restriction of the annual credit required by the cultivators. Capital is extremely sensitive of any prospect of disaster, and the system upon which loans are arranged in this district increases the natural restriction of credit at the commencement of a famine. The sums lent by the baniya are from time to time repaid in kind. But the annual settlement of accounts does not take place until an average rate of prices is struck for the whole district. This is done by a meeting of the principal traders, landlords, and cultivators at Baragaon. When the Baragaon *katauti* is struck, the rate for transactions in every other part of the district during the past year becomes immediately known.

This settlement takes place about a month after the monsoon is due, and when the prospects of the young sugar-cane are assured. By this time also the failure or success of the monsoon is certain. The cultivator has already parted with his produce in anticipation of the annual settlement, the baniya has no interest in supporting the cultivator any longer if the speculation appears attended with risk. The first effect therefore of the failure of the monsoon is to withdraw the credit upon which the whole agricultural population subsists.

If we consider that three-fifths of the population depend upon agriculture, that 90 per cent. of this class require to forestall one-half to two-thirds of their annual production, and that the capital invested in household necessaries or luxuries, or in farm stock and implements, becomes utterly unsaleable, it is easy to perceive the calamity which a sudden collapse of credit must create. The agriculturists form two-thirds of the population. The field labourers and the other classes of rural society who depend upon them for employment and subsistence form two-thirds of the remainder. The means of this class are of course smaller than those of the poorest cultivators. The male members of these classes are accustomed to leave home in search of employment. When the rains failed in 1877 and the cultivators were unable to give them employment they usually afforded, a general migration began among the field labourers; this soon extended from individual to families.

This class did not frequent the towns at first, but wandered from village to village. Mendicants and helpless persons also joined in the stampede and were the first to flock to the towns in large numbers. This migration is the first too visible sign that famine has overtaken the country. Two other ordinary effects of famine follow shortly after. The one consists in the general depreciation of every article except food, and the impossibility of finding purchasers for ordinary goods even at the lowest price. I have entered a house of a weaver who had died from starvation and found cloth enough to support him and his family for weeks in ordinary times.

Mr. Leeds.—Distress resulting from drought makes itself felt amongst the people by a rise in prices and a consequent contraction of the demand for labour. It is brought at once to the notice of the district officer not only by the reports of his *tahsildars* and police subordinates, but also by the evidence of the price current, and of his own eyes and ears. It is difficult to specify the indications which would lead a district officer to judge whether the distress were merely temporary, but in practice I think he could scarcely ever be at a loss to decide. He is kept steadily informed of the state of the crops, of prices, and of all other circumstances which affect the condition of the masses in his own district, and has ready means of access to information regarding what is passing elsewhere. The main indication of the extent and severity of distress must always be the price of food grains. When wheat rises from 25 seers, its normal rate to 12 seers for the rupee, and other food grains in proportion, there can be no doubt that very severe distress must be suffered by the labouring classes, whose remuneration at the best of times is not in excess. In the North-Western Provinces the existing district agency appears to me amply sufficient to meet the requirements of the case and to ensure early and sufficiently trustworthy information.

Mr. Cornwall.—In a district like Cawnpore, partly canal-irrigated and partly dry, *i.e.*, practically unirrigable from wells on account of the depth to water, distress first makes itself shown in the dry portion. The reason for this is that in the dry villages the crops, if any were sown, have failed from want of rain, and as the season advances the village *Baniya* plainly perceives that if he allows the cultivators food as usual, upon the understanding that he will be repaid when the crop is cut, he will be the loser. He consequently refuses to sell except for ready money, and thus throws the whole of the tenantry and their dependents, amongst whom I class the petty non-agriculturists, upon the hands of the landlord for support. In some instances the landlord has sufficient resources at his disposal to accept the burden; in others, and especially in *bhaiác-hára* villages, the whole population is thrown upon charity for support.

In the canal-irrigated villages distress does not appear so soon, as there is generally a good area under indigo and sugar-cane, for the former of which a good price is available at an early period of the season, and the latter can be sold as required for fodder of cattle, as was the case with nearly all last year's crop. In these villages there is consequently a certain degree of security for the *Baniya*, and he continues therefore to give assistance so long as that security exists; so that distress is postponed for some time, and may, as was the case last year, not appear at all.

Distress in the villages is very soon brought to the notice of the tahsildar by one of the *tahsíl* establishment, or by the supervisor, *kanúngo* or *patwári*, and through him to the district officer. But the influx of poor people to the sudder station, the unusual number of beggars on the roads, and the increase in petty thefts and burglaries, must also attract early notice.

The nature of the distress and its probable duration depend largely upon the past harvests. To compare this year with last, when the rain failed last year, there was in the early months of June and July no apprehension of scarcity. There had been good harvests, both *kharíf* and *rabi*, and the high prices obtainable for grain of all kinds in consequence of the demand for wheat for export and for other grains for the Madras and Bombay famine districts had enabled the cultivators, or at any rate such portion of them as are not encumbered with debt, to dispose of their produce advantageously. There was therefore considerable purchasing power in the villages, and if more discretion had been used and less grain exported, I think it is highly probable that the distress could have been tided over. The cultivators, moreover, had their seed grain in hand for both *kharíf* and *rabi* harvests. In spite of the failure of the *kharíf* sowings, in some *parganas* almost total, there was little distress except in the dry southern unirrigated *parganas*; and then only in villages where the Baniyas absolutely refused all help, and when the *zemindars* had not the means to assist. This lasted throughout August and September; but with the October rain the Baniyas resumed operations, and distress disappeared to a great extent; and when the December rain fell, and the *rabi* was believed safe, it disappeared entirely. This year the condition of things is very different. Last year's *kharíf* was inappreciable, and the *rabi* was a disappointment. The large area in excess of that ordinarily sown has contributed its quota to the food stock, but the grain of all descriptions is so light and wizened that in actual weight I doubt the crop of wheat and barley being above average, and grain and peas are very bad. In addition to this the failure of the kharíf has left the cultivator without seed, and for the ensuing rabi sowings he will have to obtain seed elsewhere, for none of that grown this year, except perhaps barley, is fit for use as seed grain; and above all this, the rabi has had to bear more than its usual weight, as from it the cultivator has had to pay his full rent, and also the cost of food for his family during the past eight months, both of which would have been ordinarily provided for in a great measure from the kharíf. Now he finds himself with little money and

II. Qn. 1.

NORTH-
VESTERN
ROVINCES
ID OUDH.

no seed, whereas last year he had more money than usual and the full quantity of seed, as well as some grain in store. As last year the distress under the circumstances related was only temporary, so this year, under the vastly altered conditions, there appears, in the event of rain being withheld, every probability of a severe famine. Such comparisons as these seem to force themselves into notice, and require no special steps to bring them forward. The present district staff, both revenue and police, contributes information each in its own sphere, and is quite sufficient to ensure early reports of anything deserving of notice being made. The accuracy and value of these reports must depend upon the reporters. A good tahsíldar's information is invaluable, but there are only a few such in each district. The remainder seem to take no pains or to think what they are writing, and so the result of their reports are sometimes remarkable. As a rule, the best men seem to be those who have gone early in life to active work; but the less active office men, who have worked up step by step, rarely make such good tahsíldars, though there are occasional exceptions.

Mr. Webster.—The increase of (so to speak) non-professional beggars, as it is the first, so it is the most unmistakeable sign of distress. At present—I say " at present," for I discern signs that the exceeding liberality with which Government has relieved the wants of the people at the very first sign of distress of late has tended to induce habits of pauperism, and the people are beginning (only beginning as yet) to take to begging and to clamouring for Government relief under circumstances which formerly would not have induced them to do so; between harvests when work is slack, day labourers, and when trade is bad, weavers and the like, are beginning to take to begging. This is a serious sign, and one that the Government would do well to take heed of. The consequences of pauperizing a population like that of the North-Western Provinces and leading them to rely on Government for their support at the first approach of hard times would be ruinous; and I think our famine policy does tend in some slight degree in that direction in one point; in all others I think it wise and prudent as well as beneficent and generous. The point I refer to is the suggestion (for I believe it is not more at present) that any adult able-bodied male should receive gratuitous relief from the Government because his sense of personal dignity renders him averse to working with his hands to support his life. I consider that if this principle be admitted, and if the State undertake not only to save the lives of those in danger of starvation, but consents also to allow the recipients of its bounty to dictate the terms on which they will accept that bounty, then we have taken the first step, and a very long one it is, towards the demoralization and pauperization of the population. Let this idea that Government will gratuitously support anyone able to work be once confirmed, and every man, woman, and child who does not in ordinary times earn his or her livelihood by manual labour on road or field will find personal dignity in the way of accepting anything but gratuitous relief from the State.

Captain Pitcher.—Distress cannot fail to come under the notice of any intelligent district officer from the outset, in the bare fields, in the unwonted spectacle of whole families on the tramp with want stamped in their faces; in a sudden irruption into the station of begging and starved looking children, sent out to beg by parents who are scarcely yet bold enough to venture on the unaccustomed thing; in the spectacle of men harnessed by the dozen to well ropes in the place of bullocks; by the high prices of grain; by noticing that the streams of the grain traffic are reversed, and that instead of flowing into towns the grain is flowing out; by constant reports from thánahs and tahsíls.

Mr. Lumsden.—The exact shape in which distress consequent on drought first makes itself felt among the people would depend to a considerable extent on the particular season at which it began to be felt; dearth of work for the labouring classes; a steady, if gradual, rise in prices; difficulty on the tenant's part in meeting the landlord's demands for rent, and on the landlord's part in meeting his engagements with Government; a contraction of private charity among the middle and even well-to-do classes of native society, and a visible increase of declared pauperism applying for public relief—these are some of the ways in which distress *consequent* on drought makes itself felt at a very early stage, and are at the same time certain indications to the local officers that distress, more or less severe, is prevalent in the district.

No doubt sometimes first appearances of distress are exaggerated and its severity misrepresented, but there is no risk of their escaping early notice; the risk rather is that, with the knowledge of the existence of distress, the local authorities may either propose measures of Government relief prematurely or delay doing so too long, both errors certain to be productive of evil and involve the State eventually in unnecessary expenditure.

Sir Digbijai Singh, G.C.S.I., Mahárája of Bulrampur.—At the commencement of famine the causes of the first appearance of distress to the people are apparent. The sowing process being over, a very small portion of the grain in store is left to the cultivators. When the rains fail in the month of " Sawán " (*i.e.*, from the middle of July to the middle of August) the prices of food grain in the markets begin to rise, and the poor people that are not cultivators at once begin to feel the effect of famine. The poorer among the cultivators, who depend upon work for their support, having spent away the whole or a greater portion of their grain in store, and seeing no good prospects for the future, are put to much trouble, and are compelled to ask their landlords for loans of grain for their support. The landlords, on their part, do not dare to part with their stores in such times. The cultivators are then subjected to more and more distress, and they keep with great care the small quantity of grain of which they are possessed at the time, so much so that they do not distribute the usual alms to the poor beggars, who are consequently reduced to the most wretched condition, as if near to death. When the report of these circumstances reaches the Government, orders are issued for the organisation of relief works and poorhouses for the support of the distressed people.

In great towns and cities the effect of famine is felt, first of all, by the poor people who depend upon work for their subsistence; for the dealers in grain, as soon as they find the prospects for the future unfavourable, begin to raise the price of food grain, which becomes at once a source of evil to the poor. In this case, if the market rates be carefully regulated by the proper officers of the Government, the distress may be, in a great measure, mitigated. In such towns and cities there are many old and poor people who depend for their support on their wealthier relatives and friends, and there are numerous beggars who depend upon public charity. In times of famine, when public charity vanishes away, such people are left helpless, and they then hang on Government for assistance. Many of them migrate to other districts, and life becomes a burden on them. In this circumstance the Government only can take care of such persons. It will be well to obtain, through a trustworthy official, the census of such afflicted persons, and send those who are able to work to the relief works opened for the purpose, and those who are old or unable to work to the poorhouses.

If it appear to the Deputy Commissioners of the districts that the famine is likely to last for a short period, and there is no fear of it in the future, it will be well to keep open the public and municipal works till the termination of the famine. At the same time it will be advisable to superintend the rates of the market, and keep them on a just scale, and to require the dealers in grain to lessen the price according to the nature of the crops and the supply of grain in the markets. Then such labourers on the relief works as may seem able to earn their bread somewhere else may be dismissed from the works; but those that are employed solely for the purpose of being supplied with food should be retained. When the harvest be gathered in, the market be abundantly supplied with grain, and the rates revert nearly to the original state, the relief works may be closed.

But when the famine be of a formidable nature and do not appear to vanish after a short duration, and the number of helpless persons be so great as not to be supported by the ordinary district poorhouses, the Government should open poorhouses on a large scale, at proper places, and therein feed such persons without extracting any labour from them. For such persons as cannot leave their place of abode, for several reasons, it will be proper to keep, in every great "muhalla" or village, depositories of grain, and to distribute them tickets, by showing which they should be supplied with their daily rations from the said depositories.

BENGAL.

Bengal.

Mr. Barlow.—So far as working upwards and forcing themselves upon the notice of the district officer is concerned, the actual sufferings of the people in the very early period of distress disclose but the smallest outward and visible signs. Close and continued personal observation of individual cases can alone be relied upon to secure their detection. Referring to the Orissa famine, and omitting the case of one particularly isolated tract between the sea and the Chilka Lake, where symptoms of actual famine were discovered as early as November 1865, the state of actual distress, which must have prevailed generally in all districts was not discovered by the officers who were anxiously and carefully watching for it. It was not until May 1866, when the people began to come into towns, and actually famine-stricken objects showed themselves, that the reality and magnitude of the calamity was fully recognised and acknowledged.

Similarly, in February 1874 I made a tour in North Bhagulpore in company with the Collector, to examine into the state of affairs. We had no difficulty in ascertaining the fact that the crops had failed and all classes were freely predicting distress, present and to come; but beyond an unusual congregation of beggars at our camping places, which might be explained by the knowledge of these people that we were prospecting famine and the hope of something to be gained thereby, our opinions as to the existence and extent of distress had to be based more upon the theory of what must be the effect of the failure to the crops than upon conditions of actual suffering amongst the people generally that we were able to discover. This fact is probably explained by the circumstance that the poorer classes concerned are at all times in a comparatively destitute condition. They live from hand to mouth. They have no property, nor anything in respect of which distress or famine can operate until it touches their bodies. Emaciation takes some time to appear. The lowest classes always supplement their food with an admixture of herbs procured from field or jungle. The proportion of these is increased as pressure increases, and even after the consumption of wholesome food has entirely ceased, life is preserved by subsistence upon *sag*, &c., until prostration.

A district officer would, I suppose, judge whether distress is due to temporary or local scarcity, or likely to be the forerunner, of very general severe distress ending in famine, by observing the extent of failure of crops and the range of prices in his own district and elsewhere. He would also consider whether the last year or two had been years of plenty or otherwise, the state of stocks, trade, &c. As regards the state of crops and prices, I think that existing means are sufficient for keeping officers informed of what is going on; what with weekly notifications in the Gazette, newspaper reports, and communications (personal) between officers, and lastly, the action of Government itself early in the season, when times become very threatening. The state of stocks and trade under the Bengal system is a knowledge to which the district officer cannot attain. Government are collecting statistics of river trade at registering stations, and they receive the railway traffic returns. These may be conveniently supplied to local officers as soon as a means has been devised whereby they may know something about the produce of their districts, but not beforehand. This point will be noticed in detail under question 5.

My opinion is most distinctly that the existing district organization is not sufficient to ensure early and trustworthy reports as to distress. The direction in which it fails has been indicated above. The information which comes before all officers alike is vague, wanting in detail, and often inaccurate. This naturally produces a similarity of views and tone amongst officers of all grades, and with the tremendous responsibility involved, no man can take a line of his own with any confidence, whether it be in the direction of raising an alarm or resisting one. The remedy which naturally suggests itself for this state of things seems to be to reduce the unit of administration. Given a year to prepare beforehand for certain famine, I suppose that by sub-dividing sub-divisions and districts, and putting officers to work under active supervision, in areas of a moderate size, we should be able to make a list of the names and numbers of people that would be likely to require relief. In the absence, however, of any possibility of keeping up a permanent organization of this kind, while we wait for famine, there is no alternative open but to try to render the present agency (which should be strengthened wherever and whenever opportunity permits) as efficient as possible. I think that the way in which this may be best helped forward is by putting into the hands of the district officers accurate statistics regarding the food supply, and the economic condition of the agricultural and labouring population of their districts. If this was done it should lighten the difficulty of dealing with matters when bad times come. The district officer should then have a fair idea at least in what quarters to look for loss and distress, and by a system of closer inquiry within limited tracts, calculations more approximately correct than the general ones heretofore adopted might be worked out. This is probably the idea that the late Lieutenant-Governor, Sir G. Campbell, had in view when he created the Subordinate Executive Service in Lower Bengal; but owing to the occurrence of the famine of 1874 immediately after, and the staff becoming from the first swamped in the general administrative work of the country, statistical inquiries have been hardly touched up to date.

Although the staff available is small, I think that a beneficial result would soon be apparent in this part of the country if they were steadily kept at work upon the subject in hand. In order to effect this, I would constitute a Statistical Department in charge of the officers of the Subordinate Executive Service in each district in Bengal, and I would put a stop to the miscellaneous administrative work done by them, which was heretofore performed by the ordinary district staff. New measures, like taxation, &c., should pay for the agency necessary to introduce them.

Mr. Worsley.—Distress, consequent on drought, first makes itself felt among the people by compelling them to reduce their daily consumption of food grains, and to part with such property as they may possess in the shape of clothes, trinkets, &c., in order to obtain money for the purchase of food. If the district officer be a man of active habits, his own personal observations will apprize him of the existence of distress, but in any case the distress will be soon brought to his notice by the police.

The three harvests of Behar are *bhadoi*, *aghani*, and *rabi*. The first two rarely fail in an equal degree in the same year, and I should say generally that the total failure of any one harvest would not in itself cause famine. I have never myself known any instance of a *bhadoi* harvest falling below eight annas, and a failure of the crops to this extent would not cause me any anxiety. It is the combined failure of the *aghani* and *rabi* crops that causes famine, and a failure of the latter harvest usually follows a failure of the former.

When the latter rains, *i.e.*, the rains of August, September, and October, have generally failed and a very short rice crop has been reaped; when little or no rain has fallen during the winter months, and *rabi* prospects are poor; when the reports of neighbouring districts are unfavourable, prices high, and importations small, the appearance of distress under such circumstances would lead me to apprehend severe general distress in the future. If on the other hand the failures of the rains and harvests have been confined to my own district and one or two neighbouring districts, and if prices be kept down by importations of food, I should fear nothing more than temporary scarcity. But even with the worst prospects in February or March, a favourable change in the weather, such as to admit of "*cheena*" being widely sown and a fine mango season later on might serve to avert severe general distress. From the time when the failure of the rains is an ascertained fact, the attitude of the district officer and his subordinates should be one of constant watchfulness, and the former should make a point of visiting every portion of his district during the ensuing winter. In this district there are unusual facilities for obtaining early and accurate information regarding the state of the crops and the condition of the people, owing to the large number of indigo factories scattered about the district. The information supplied by planters, sub-divisional officers, and the police, and my own thorough knowledge of the district and frequent excursions into the interior at all seasons of the year, make it very improbable that distress should take me by surprise at any time.

Mr. Hodgkinson.—It is not in the appearance of the people themselves that a district officer will look for the earliest indications of distress. At the best of times the poorer classes live very sparingly, and the deterioration of their condition in times of dearth is very gradual. After they have been reduced to half rations, or to one meal a day, for some time, signs of want and emaciation may be traced in the persons of the children. But long before this period is reached the existence of distress ought to be recognised and measures to relieve it commenced, unless indeed a new harvest is just at hand. The distress in 1866 was taken in hand too late; relief works opened at an earlier stage would undoubtedly have mitigated much suffering and saved not a few lives. So silently was the distress borne, and so slight were the outward signs of it, that few in the district had any conception of the extent to which it had grown when relief depôts were opened.

The district of Sarun was at the Census of 1872 found to be the most densely inhabited agricultural district in the Lower Provinces. The population averaged 778 per square mile, varying from 605 in Baragaon *Thana* to 984 in Musruckh. The people, except in some half a dozen of the principal towns and trade centres, live almost exclusively by agriculture. Though the fertility of the district is extraordinary, the area is limited, and by the pressure of requirements of the ever-increasing families of petty maliks and the more influential cultivators, as well as by the growth of indigo cultivation, principally on the *zuraut* system, large numbers of the poorer classes have lost their lands altogether; and holdings have become small by sub-division. There is therefore, an unusually large labouring population, a population, for which even in good years the district barely affords adequate employment. It is naturally amongst this class that in years of dearth distress first makes itself felt. Employed ordinarily in field labour, a long drought at agricultural seasons of the year restricts their subsistence. If the former harvests have been good and they have been able to put by a little store, or if prices are moderate, some time will elapse before anything like actual general distress shows itself; but distress more or less severe must be the necessary concomitant of a continuance of the drought for any lengthened period. High prices and the difficulty of obtaining labour are the consequences of drought first felt by the people. The returns furnished from the district bazaars are sufficiently good evidence of the prices; and the resort of unusual numbers to the ordinary road repairs if going on, as well as an unusually active emigration from Sarun in search of temporary employment in Cooch Behar and eastern districts, will generally prove the short demand for labour in the district.

In order to form an estimate of the character of the distress, the safest indications may be ordinarily derived from a consideration of the prices at the different bazaars of the district taken in connection with a general estimate of the food supply of the district and of the country generally, as well as with the prospects of any crops which may be or should be on the ground. The power and direction of trade will also have to be considered, and the quantity and distribution of the rainfall. Special circumstances will also affect the estimate. Thus the hailstorm of February 1866 directed attention to probable intensity of distress in a particular tract, and the failure of the poppy in the present year points to the unusual impoverishment of a particular class. The existing district organization is supplemented by a large non-official class in this district, and the receipt of early and trustworthy reports is fairly secured. But undoubtedly something could be done, and I think ought to be done, to obtain agricultural and trade statistics. Our estimates of stocks in hand are the veriest guesses. In Behar the *ptwaris* might well be made by law to file statistics of cultivation. They might not be very accurate at first, but they would be at least better than nothing. I obtained statistics through the *ptwaris* when at Hutwah for a portion of the estate, and found them, as far as I was able to test them, a fair approximation to the truth. In the bazaars a *chowdry* might be appointed at a very inconsiderable cost, and with a little training and supervision at first from some of the district staff, tolerable estimates of exports and imports might be arrived at.

Mr. Metcalfe.—If the police or sub-divisional reports state that the lower classes are beginning to leave their homes and wander about; that petty grain thefts are increasing; that the village markets are scantily attended; that beggars are increasing; that ornaments are being pledged, it is to be taken for granted that local distress has actually commenced. It is a very remarkable fact that, as soon as the pressure of famine is felt in a village, the inhabitants proceed to wander over the country, partly in search of vegetable roots, and partly in the hope of finding food which they cannot obtain in their own villages or fields. It is to my mind one of the most painful signs of the scarcity of food to see women and children wandering restlessly, silently, with downcast faces, through the mango topes and jungles searching for food, knowing that none will be found, yet still hoping to find some vegetable food or berry to appease the pangs of hunger. It will depend very much upon the character of the sub-divisional officers and their active habits, how far the district officer can be guided by

Ch. II. Qn.

Bengal.

their reports as to the exact extent and magnitude of the impending scarcity. In most instances he will do well personally to visit the places indicated without any loss of time. The district officer will be warned, too, by the advent of beggars into grain marts and towns that the scarcity has already affected the very poorest of the population.

It should be an important part of the duty of every police officer to submit weekly reports of the agricultural prospects of his police station. The police in Behar have been gradually instructed to do this, but my experience is that it is still difficult to obtain accurate information from them. As a rule, police reports are too general in their character to be of much practical use in conveying accurate information. For many years the police have regarded themselves as a body for the suppression of crime only, and are backward in reporting on many general subjects which it would be useful for the district officer to know. The districts which have a patwari agency are far in advance of those districts which have only the police information to guide the district officers. In my opinion, the existing district organization in Behar is sufficient to ensure early and trustworthy reports in agricultural matters. The police and sub-divisional officers have now by experience learnt to regard weather prospects as important a part of their duties as criminal work.

So many of the larger districts have been sub-divided that there are few tracts beyond the personal supervision of a magisterial officer. The reports on rain-fall, submitted weekly to the district magistrate, keep him informed of the condition of the crops and of the agricultural prospects of his district. Within the last few years the local police have been gradually worked up to the importance of reporting on agricultural prospects. Formerly little attention was paid to this subject of crops and weather by either sub-divisional or local police; but even under the existing district organization it is quite possible for high prices to rule in parts of a district, virtually reducing the poorest class to great distress without immediate attention being called to this subject. Zemindars, even in cases where their tenantry are concerned, are found to be dilatory in conveying information.

Previous to the Behar famine of 1873–74, there were five occasions in which local scarcity of food grains prevailed within a period of 17 years; on each occasion there was more or less loss of life amongst the pauper population; yet these partial failures of crops at the time attracted no marked attention. The agricultural poor accepted the distress with that marvellous patience and meekness characteristic of the native in famine years almost without a murmur. My opinion is that the district officer must trust chiefly to his own energy and activity to ascertain exactly the area and extent of scarcity. Although much may be done—

(*a*.) By training police officers that their attention must be directed to the agricultural prospects, as well as to the detection and prevention of crime.

(*b*.) By raising the position of the subordinate officers of police, and introducing a better class of men as inspectors.

(*c*.) By encouraging correspondence between district officers and landed proprietors on agricultural matters. Letters addressed by collectors to zemindars asking specific information invariably meet with a ready response, though the information given is not always accurate or sufficiently in detail.

Mr. Kirkwood.—In Bengal (Lower Provinces) the existing ordinary district staff, if well turned to account, is quite sufficient to ensure early and trustworthy reports. People now-a-days are so well aware that it is the desire of Government to aid the famine stricken in their affliction that they are not slow in bringing to light any features of an alarming nature. Even at the end of 1865 in Orissa they did so, though the Government policy was not then so certain, and they for some time, even in the face of discouragement, persisted in not remaining silent.

BOMBAY.

Bombay.

Mr. Spry.—Distress consequent on drought first makes itself felt,—

(*a*.) By a rise in the price of all the necessaries of life.

(*b*.) By the demand for labour decreasing below the supply.

This distress is first brought to the notice of the district officers,—

(*a*.) By personal observation.

(*b*.) By perusal of the returns of rain-fall, of the prices current furnished by the different *taluka officers*; of the reports respecting the condition of the people and crops furnished by the same officers, and of the police reports on the subject of crimes, especially dacoities, gang robberies, and thefts.

A district officer might judge whether the distress is due to temporary scarcity by considering the time of the year when such distress takes place. For instance, if it breaks out say in April, he might reasonably conclude that the ordinary break of the south-west monsoon in June would bring down the prices of grain, and would also afford occupation in field work. He would judge whether it was due to local scarcity, by ascertaining the prevailing prices of grain in surrounding and accessible districts.

He would judge whether the distress was likely to be the forerunner of very severe general distress ending in famine,—

(*a*.) By considering the season of the year. If it broke out after a failure of the monsoon rains and during the time when the crops are being or should be harvested, the presumption would be that it would continue increasing until the next harvest came in, unless measures were adopted for mitigating it.

(*b*.) By ascertaining whether similar conditions prevailed in surrounding accessible districts.

To ensure that indications of distress are brought to his notice, the district officer should insist on all his subordinate *taluka* officers moving actively about in their charges, and punctually reporting the condition of the people, prices, &c. He might also invite the opinions of intelligent *inamdars*, landholders, and other natives of position.

The existing district organization is, in my opinion, sufficient to ensure reasonably early and trustworthy reports, I will not say entirely trustworthy reports, because a margin must always be allowed for exaggeration and sensation. I cannot suggest any other measures, nor do I think them requisite.

Mr. Charles.—Distress first shows itself by an increased number of beggars and strangers coming into the larger towns.

The existing organization is quite enough to bring the fact to light if the *Mamlutdars* do their duty, and are constantly warned to report all indications. The question whether the distress will develop into a famine or not depends mostly on the crops of the area from which the district draws its supplies, whether within or without its own borders, and, further, on the condition of the surrounding districts.

Thus if the crops in Bellary and Kaladgi had failed a scarcity in Dharwar would be nearly sure to turn into a famine, because not only would a large part of our supplies go to these districts, but we should also have to feed large bodies of Kaladgi and Bellary people, who would be sure to leave their homes. An inter-

H. II. Qn.

BOMBAY.

change of information between contiguous districts would seem necessary.

Mr. Propert.—On drought becoming apparent, the demand for field labour ceases, and consequently a very large number of persons throughout the country lose their occupations. The grain merchants, who carefully watch the prospects of the season, on the appearance of drought at once raise prices of food in the bazaar. This, of course, quickly affects the poor Musalman population of the towns. Employment and assistance are at once demanded, and the district officials naturally bring the state of affairs to the notice of their superiors.

At the outset no district officer can tell whether the distress is simply due to temporary scarcity. Local limits must of course depend upon circumstances. Experience can alone show the probable result of the distress. If drought commences very early in the season, and no rain falls subsequently, so as to enable sowing operations to proceed, it may safely be inferred that severe distress will ensue.

No special steps are necessary; the district officers are frequently inundated with complaints concerning the prospects of the season when no real cause for anxiety exists. When distress is really imminent there is certainly no chance of information on the subject being in any way withheld.

As before stated, in this part of the country no difficulty whatever is experienced in gaining information concerning scarcity. The village and *taluka* establishments, are quite sufficient for the purpose.

Mr. Norman.—Distress is first brought to the notice of the local officers by crowds of people flocking to the head-quarters of each *taluka* and clamouring for relief. Distress is first caused by a general rise in prices and the absence of the usual field labour, such as weeding, cutting grass, sowing, &c. Local officers can only judge whether distress is likely to be local and temporary or permanent and severe by the accounts received of rainfall in the surrounding districts and provinces. Rain returns are periodically received by Government and published. The existing district organization is ample to ensure early and trustworthy reports.

Mr. Hamilton.—It would not be before all hope of a sufficiency of rain had passed that apprehensions regarding a famine would be felt. If the first S.W. monsoon failed entirely there would be undoubtedly scarcity for a few months, but the later crops might turn out first-rate, and in such a case no famine would be feared. I do not think a district officer could fail to observe the first symptoms of a famine in this district. The village officers are constantly attending the taluka head-quarters, and then would report to the *Mamledars* the state of their respective villages, whether sowing operations had commenced, or whether there was distress among the people. Summarised reports are submitted weekly by the *Mamledars* to assistant collectors, so that in any case of doubt no delay need arise in making preparations for meeting temporary distress.

Mr. Moore.—The withdrawal of private charity, and the consequent appearance of beggars, who collect together and must be supported. Then the lowly paid village servants and the poorer class of cultivators and labourers begin to feel uncomfortable, and the latter to wander about in a state of uncertainty, getting into bad condition gradually; for, unless Government provides it, there is no work for them, and food is withheld by those who possess it.

The district officer can judge by the nature of the season whether distress will be local or temporary or general.

The revenue and police subordinate officials would be warned to be on the alert, *Mamlatdars* and chief constables would make daily reports; and on the appearance of any distress village inspection would be organized.

The existing district organization is sufficient to ensure early and trustworthy reports; it is only when distress becomes widespread, and house-to-house visitation is necessary, that extraneous aid is required.

Among the existing district organization I include schoolmasters and sub-registrars and municipal servants.

Mr. Robertson.—Distress consequent on drought first makes itself felt by the rise in the price of food grains, and the absence of employment for the labouring classes.

As we have a *Mamlatdar* or local officer in each *taluka*, and again *patels* and *kulkarnis* in each village, the village officers soon bring to notice the fact that the times are hard. The *Mamlatdar* immediately makes his inquiries, and reports to the assistant collector in charge of a *taluka*. No local scarcity can bring on a famine in the locality in which such scarcity exists, as, thanks to railways and roads, grain would pour in at once.

If the rains should hold off, the local officers (*Mamlatdars* and assistant collectors) will be on the watch. Should the rains hold off so that the *kharif* cannot be sown, or if it prove unfavourable for the growth of the *kharif*, they will expect some difficulty. If the unfavourable season is extended and seriously affects the rabi, then they cannot fail to know that the chances of severe distress are greatly augmented.

The reports regarding the weather and crops are submitted so often to the officer in charge of a *taluka* that he must be blind if he is not well aware of the state of matters.

The present district organization is amply sufficient, in fact I may say perfect, as regards ensuring early and fairly trustworthy reports. There is a natural tendency amongst native officials to be rather alarmists, but an assistant collector knows the man he is dealing with. Further, I am glad I can say that in this presidency an assistant collector, if he had any doubt of the information given him, would at once ride into his *taluka* and see things with his own eyes.

MADRAS.

MADRAS.

Sir W. Robinson.—It would be impossible to devise more certain means of knowing the precise condition of the crops and of the people in every village, than we possess in South India. We have in every village a village establishment; and we get from every village periodical statements of crops, &c., with reference to the Revenue administration.

Wandering is always the first sign of pressure of want in the homes of the poor and it at once indicates deficiency of attention and relief where both are most urgently needed:—namely, in the villages.

Mr. Price.—In an increase in the price of food, and consequent falling off in the quantity procurable.

What I, as a district officer, would take as a sure indication of coming bad times would be a very considerable failure in the crops of the preceding year, followed by failure of the monsoons in the year under consideration. This, with increasing prices and increased demand for employment on the part of the laboring classes, ought to be a sufficient warning to prepare for the worst. The crowding of women and children to works, the sale of ornaments, the falling off in condition of the mass of the people, and the increase in crimes against property, come at a later stage; but they succeed with marvellous rapidity the period when a district officer may definitely declare that famine exists in his charge. I do not think that there can be any difficulty, if a district officer is fairly on the look out and knows his district, in distinguishing temporary and local distress from what may eventually end in famine.

Local Distress.—I speak now of a district only—can be easily enough dealt with; so can temporary, where for instance there has been a very serious failure of the crops of one season, but it is clear that, unexpected and improbable circumstances excepted, the next will prove good and the period prior to the expected harvest has alone to be tided over. The difficulty is to tell the exact period when temporary distress begins to pass into famine, and when the State should step in with relief measures of an extensive character.

I have no suggestions to make as to the course to ensure that indications of distress are brought to the notice of district officers. I consider, however, that districts and divisions, as a rule, are far too large. The staff of Native subordinates is also too small, and their charges are too extensive to allow of their being readily worked.

Mr. Longley.—Distress is first felt by insufficiency of food resulting from high prices, which is indicated by people supplementing the same with deleterious roots and fruits, which they would not eat as food in ordinary seasons.

The district officer would ascertain this from the monthly price returns received from the taluks and from special reports to be submitted to the collector by the Tahsildars through the divisional officers.

Temporary distress is indicated by the rise of prices consequent on large exports to other districts. Local distress manifests itself by rise in prices caused by a failure of crops in a particular part of the country. The signs of a general severe distress are discovered from (1) the unfavourable prospects of a coming harvest, (2) the state of the stock in hand, (3) the abnormal rise of prices consequent on the above two causes, and (4) the *intense anxiety* of the cultivating classes (small puttadars especially). These indications were all present in December 1876, when a *severe* distress was apprehended.

The submission weekly by Tahsildars to the collector, through his divisional officer, of reports showing (1) the state of crops, (2) the prices of grains, and (3) the condition of the laboring classes, and the frequent visits of the collector and his divisional officers to the taluks to *test the accuracy of the information received* are sufficient. No other measures suggest themselves.

The existing organization is quite sufficient for the purpose, and I have no other measures to propose.

Mr. Webster.—The existing district organization suffices to ensure early and trustworthy reports of rain-fall, cultivation, health of people, and a tolerably fair report of the out-turn of crops. But this information, as I have said above, is not sufficient to enable a fairly accurate forecast to be made. What is needed is an accurate return of the stocks of food-grains in the district at the commencement of each month. Such a return could not, however, be prepared without a large establishment and considerable inquisition. Estimates are made, but they are framed on no sure basis, and must, from the nature of the case, be a mere surmise. The quantity of rail-borne grain imported into, and exported from, the district can easily be obtained, but it would be necessary also to ascertain the imports and exports by land. This would be the greatest difficulty, and would require a considerable establishment. It would not be difficult to ascertain the actual outturn of the crops in a village, though the returns would most probably be under the mark as the ryots would think there was some new form of taxation in view. At present the Curnam prepares the return of outturn on a mere guess. He takes the number of acres cultivated under each crop in his village and calculates the amount of outturn at so much per acre. This will be far from correct, because the rate of yield per acre is arrived at on no fixed principle, and because the lands which, although cultivated, have no crop are not omitted from the calculation. I think that with our comparatively small villages and village establishments to which some addition would, if necessary, be made, and looking to the measurement of the produce as a recognised custom of the country as between landlord and tenant, there would be no difficulty in having all the crops in a village measured. It is doubtless an inquisitional and therefore a somewhat retrograde measure; but I do not think we should compare India with other countries more fully developed, and some such arrangement must, I think, be made. The information thus collected would tell us approximately the monthly out-turn of the district, and an estimate could be formed after a few years of the quantity of grain required for the consumption of the people for a year. We could then, on a failure of the cultivating rains, judge the then state of the stocks, how long they are likely to last, when and to what extent to be supplemented, and could forecast when they would be reduced so low as to materially raise the prices and thus cause distress, and when, if not supplemented, a famine of food.

Mr. J. G. Horsfall.—Distress first makes itself felt among the poorer classes by the diminution in demand for field labour owing to the stoppage of agricultural operations, by their consequent inability to purchase their usual food supplies while prices are doubled, trebled, and even quadrupled the prices in ordinary years. The district officer first of all receives, from his divisional and taluk officers, reports of an unfavourable season, of the withering and loss of crops, of the want of work for the labouring classes, of the failure of pasturage for cattle, and of drinking water for the people. He is inundated with petitions from the ryots praying for remission on account of the loss of crops. There is usually a sudden rise in prices followed by extensive increase in grave crimes, robberies, and dacoities, by panic in the bazaars, and by a marked increase in the number of persons soliciting alms. Ascertaining that high prices are caused by failure of crops, and not by exportation of produce to other districts where distress may previously have arisen, the district officer has then to learn the condition of surrounding districts and the state of the markets throughout the Presidency at least. Should reports from all quarters or from his neighbouring districts be no better than those of his own district, he may reasonably conclude that distress is likely to be general and to be followed by famine modified or intensified accordingly as immediately preceding harvests have or have not been plentiful. A district officer of any experience of his district may miscalculate the extent to which distress may reach, but can never be mistaken as to the sign proclaiming it coming. Famine follows a bad season, and should, with the exercise of ordinary caution and judgment be foreseen six months beforehand.

The existing district organization is sufficient to ensure the district officers being fully informed of indications of coming distress. Indeed, the danger is that they will be magnified and exaggerated, and to check this tendency it should be the district officer's first duty to gather by personal inspection of his district the extent of failure. He should also call for weekly reports from each taluk as to the rain-fall, extent of cultivation, condition of crops, stocks of food grain, prices, extent of demand for labour, movement of people, increase in crime, state of health, disposal of personal and real property including cattle and land, and the direction of trade whether export or import.

Mr. Martin.—A district officer who keeps his eyes on his price lists and on his rain-fall registers ought to have no difficulty in predicting the approach of distress of some sort. It is then his duty to send special orders to his Tahsildars, Deputy Tahsildars, Revenue Inspectors, and superior office establishment to go on tour in different parts of his range, while he should himself take such a tour without delay as will give him a pretty accurate idea of the state of production from

CH. II. QN. 1.

MADRAS.

the last harvest and the anticipations of the people themselves. The reports to be submitted by the subordinate officers should notice the estimated production both as arrived at by the officers themselves and by the accounts given by the village officers; they should state whether many or any of the people showed signs of suffering in their physique, whether they are living on unusual or unfit food, whether they have parted with their property to an unusual extent, and whether any of them who ordinarily do not emigrate have left their villages. If the failure of crops appears by general report to be very general and of a high per-centage coupled with high prices and a deficient or badly-distributed rain-fall, and above all if the wells are very low when they ought to be full or nearly so, then such indications of distress as I have noticed will probably mean twelve months' famine if it occurs in the Madura District at the close of the north-east monsoon, particularly if neighbouring districts are similarly affected. If such indications occur at the close of the south-west monsoon, the distress has a much shorter time to run until the arrival of the north-east monsoon rains, and in the first year of distress it will not be severe, because there will still be the grain grown in the previous north-east monsoon, constituting the great bulk of the food-supply, to prevent the markets running very short.

I consider that the existing district organisation here is sufficient to ensure early and trustworthy reports, if the ordinary office-work beyond what is absolutely necessary be postponed, and the divisional establishment be freely deputed on tour in different directions.

Mr. Cook.—If district officers be constantly on the move, the present organization would, I think, suffice for early and trustworthy reports; but it is very essential that a district officer should move about when distress is imminent, for Tahsildars (owing to their multifarious duties) and others are either inclined to be apathetic, as they hate the trouble of famine duty and thus conceal real facts, or else they are over-frightened and exaggerate the true state of things.

Lieutenant-Colonel Hasted.—Work rates remaining the same while the price of food is increasing, ordinary labor, such as tank diggers, as prices increase, forsakes the scattered works in the villages, and flocks to works in the neighbourhood of towns and large bazaars, and then migrates to more favored districts, where food is cheaper. Small cultivators, cultivators' servants, and low-caste people (Malas) who do not usually work under Department of Public Works, will then come on works, and later on ryots of a better class. If the scarcity is temporary or local, the tank-diggers will leave the distressed part, but the other classes will not; if famine is to be anticipated, all classes will begin to move to where food is more plentiful.

MYSORE.

MYSORE.

Mr. Ricketts.—By high price of grain and less of it coming into rural towns and markets for sale. The district officer has in great measure been forewarned of this by his own observations and by the reports of assistants and amildars, added to the communications of unofficial natives whose thoughts, conversation, and even correspondence run much upon crop prospects and prices. Temporary or local scarcity would be produced by failure, more or less, of crop in a limited area, and where the sufferers would mostly be relieved by going to their friends or relatives or to well-to-do employers in other places, or getting direct help from them, and there would only be a small residuum to be helped by some relief work. But where the area affected by drought is large, the knowledge of the impending distress is soon brought to the ken of all. The poor can find no private employment, nor can they get those money advances which are readily obtainable at other times in return for their labour. As the crops go on failing or withering, the straw is sold for present maintenance without regard to the future. Then fowls are sold at any obtainable price, and after that cattle, and then ornaments. These indications of a regular famine occurred in this district so early as the latter part of the year 1876, and then in the beginning of 1877, when all available resources were disposed of, began the wandering of the poor.

CH. II. QN. 2.

QUESTION 2.—CLASSES OF THE RURAL POPULATION FIRST AFFECTED.

Which classes of the rural population are first affected by serious failure of crops likely to produce famine? In what way are they affected, and how is the effect manifested? Do the early applicants for relief consist of whole families or of isolated individuals? Are all sexes and ages equally represented, or do women and children preponderate among them? So far as the applicants are field labourers deprived of employment, does this arise because the employers have no money or grain to spend on wages, or because there is nothing to do in the fields?

Punjab.—7 officers have answered. The replies are of the same effect as above. Women and children form the bulk of the first applicants for relief.

North-Western Provinces.—33 officers have answered the question. The opinions expressed are similar to those from Bombay. The women and children come first for relief, the men still finding, or hoping to find, employment at home.

Bengal.—21 officers have answered. The majority think that the agricultural labourers are first affected and village artizans, and that women and children first come on relief.

Bombay.—12 officers have answered the question. The substance of their answers is—

The classes first affected are: (1) beggars, (2) the lower village servants and artizans who receive payment in kind, (3) the labourers for wages, (4) the poorer cultivators. They are affected thus: charity ceases, and then field labour. The women and children apply first for relief. Field labourers suffer because there is nothing to do in the fields.

Madras.—21 European and 5 Native gentlemen have replied to this question.

The classes of the rural population first affected by serious failure of crops are said to be (1) the agricultural labourers; (2) the petty landholders; (3) handicraftsmen; (4) beggars and persons more or less dependent on private charity. The first are thrown out of employment; the second are deprived of their ordinary means of subsistence; the third find less demand for the product of their industry; and as regards the fourth, the surplus of which in good seasons they are participators has no existence when harvests fail. In the earlier stages of distress applicants for relief rarely come in family groups. Women and children preponderate over the adult male element. The failure of employment for the labouring classes is said to be due in the earlier stages of distress more to the suspension of agricultural operations consequent on drought than to the want of means on the part of employers.

PUNJAB.

Punjab.

Muhammad Hayat Khan.—The distress is first felt among the poorer classes of agriculturists who own little or no land, and have a large family to support, and who are already indebted to the village bankers, and always pay their revenue by borrowing money from them and who at the harvest time make over their grain to the village bankers in payment of their debt. These people suffer on the first approach of scarcity; they cannot obtain any loan of money for the purchase of food, seed, or cattle, and are obliged, when pressed by hunger, to sell their household goods, not even excepting the timber of the roof of their house. When all resources are exhausted, they leave their home with their family in search of employment. The able-bodied among them obtain their livelihood by working as labourers, while the infirm and children go to large towns for the purpose of begging. They do not, as a rule, move in a body, but get themselves dispersed in the country. Besides the poorer classes of agriculturists, the lower orders of the working population, such as *Churás, Dúmnás, Jolláhá, Mochí,** also suffer on the first outbreak of the distress. These people entirely depend on the cultivators for their maintenance, and it is natural that when the latter are unable to provide for themselves, the menial labourers and artizans must, as a matter of course, suffer. In last year's scarcity, when the price of food grain rose very high, they left their villages in large numbers. The sweepers generally took to thieving, and satisfied their hunger by eating stolen cattle. Relief works on a small scale were opened for them in different localities, and they with their women and children were employed in them, while those who were unable to work received gratuitous relief. In this manner a considerable number of them were relieved of their distress. The effect of distress manifested by the different classes of rural population was not always the same. The lower order of working men, who generally obtained their livelihood from the tillers of the soil, left their village with their wives and children on the first appearance of the distress; but the cultivators were slow in applying for relief; they stood manfully till their last resource had been exhausted, when no work was left to them in their fields, and when they could not obtain any loan of money or grain from their bankers; in short, when reduced to the last extremity, they (only the male sex) left the village in search of employment. They supported themselves and their family with their earnings, but when the distress became severe their women and children also left their homes. They did not go out in a body, but dispersed themselves in different directions, each seeking for his or her bread. In time of distress the owners of land, with a view of economy, dispense with the necessity of hired labour and work for themselves. This is another reason why the poorer classes of cultivators and labourers are thrown out of employment on the first approach of scarcity. When they do not find any work at home they roam about in the country in search of employment. These men can be most profitably employed on earth-work.

Captain Wood.—The resources of the district have not, however, been taxed by the temporary distress I have noticed. We have had, and have still, to deal with a much more numerous and difficult class, *viz.*, immigrants from Kashmir and Poonch.

It is unnecessary here to describe the deplorable state of the people of these territories, for this is already well known to Government.

Notwithstanding the prohibition of emigration by the Kashmir and Poonch authorities, numbers of famine-stricken Kashmiris have found their way into this district; and these are the people to whom my remarks will specially refer.

These refugees are for the most part of the labouring class, who in favourable seasons earn sufficient for their sustenance, but who owned little or no land in their own country. The complete failure of the last *kharif* (chiefly maize and rice) threw these unfortunates out of employment; and in the early part of this year they were found in hundreds in and about Murree in a state of the most utter destitution. These were mostly women and children, lads under 15, and infirm old men.

I am informed that the present *kharif* is favourable, but that so many of the labouring hands have died and disappeared that the rice crop will probably be only ¼th of what it ought to be, from want of hands to weed and tend it.

Lieutenant-Colonel Parsons.—(*a.*)—The village menial classes are first affected by a serious failure of crops owing to their being the poorest, and living a hand-to-mouth existence; next to these the cultivators and petty landholders.

(*b.*)—Applicants for relief are usually accompanied with their families. (*c.*)—Women and children somewhat preponderate in quest of relief. (*d.*)—When there is failure of crops there is no work for the field labourers, nor wages to pay them, as the wages are paid in kind out of the reaped harvests.

Mr. Coldstream.—The classes of the rural population which are *first* affected by serious failure of crops are the numerous village menials and handicraftsmen, such as weavers, sweepers, tanners, potters, and carpenters. These classes in villages of North India are dependent for their subsistence upon the cultivating proprietors of the village, and that subsistence is usually paid to them in grain, and not in cash. When drought has occurred, and stocks of grain run low in the houses of proprietors, the means of subsistence of these classes is wholly or partially withdrawn.

All sexes and ages suffer equally, and the first suffering is not because there is nothing to do in the fields; but because the proprietors have little or no grain in which to make the usual payments to the village menials (*kamíns*).

Mr. Roberts.—The classes who first feel the pressure are village servants and agricultural labourers, who are never able to make provision for the future, but are paid by a per-centage of grain at harvest time, or else are supplied by the proprietors through the dull season of each year, on condition of giving their labour when required. Distress next falls upon small landholders, whose crops are generally mortgaged to the baniáh for advances, and who are supplied by him with food at *bazár* rates to support them while the crop is coming on. As soon as the *baniáh* perceives that the crop is likely to fail, he stops his supplies, or gives them on progressively harder terms, and he is able at any moment to reduce his customers to the point of starvation. Such small proprietors, living in this precarious way, are very numerous, especially throughout the country, while agriculturists who have a stock in hand for future contingencies are quite the exception. Able-bodied labourers, without children, generally leave the villages of their own accord, and get employment wherever large earthworks are in progress; but proprietors are always

* These men suffer first of all. H. P.

Ch. II. Qn. 2.

Punjab.

anxious to retain them at home as long as possible, so as not to lose their services when required; and to this end they supply them with food as far as their means go. Those having wives and children cannot easily be induced to leave their villages even when the pressure of famine has been severe, and these soon become too weak and emaciated for any sort of labour. Among the applicants for relief, women, children, and aged men largely preponderate. Distress among field labourers results partly from the impoverishment of their employers, who, as I have said, oppose emigration, and support their labourers as long as they can, and partly from the failure of field work.

Mr. Benton.—I can corroborate what the Honorary Assistant Commissioner of Kaithal says, that low caste people, such as Chúras and Chamárs, are the first to feel the pinch. During the latter part of the month of July last I observed whole families of these people moving along the grand trunk road in the direction of Umballa, a great many of them much emaciated by want of food. I put questions to numbers of them, and found that they had come from Gurgaon, Rájwára, *i.e.*, Rájputána, Agra, &c., and were going towards the Punjab, because they had heard there had been rain there. The Chúras preponderated. These people live, a great many of them, by doing jobs for landholders or taking service with them. When famine comes there is no work to be done, and no service to be had, and they must leave for some other part where they can get work, or starve. The case of these people, the common serfs of the village, is different from that of the agricultural castes. Only lately I observed that a good many Játs and other agriculturists from Rohtak and neighbouring districts, on account of the distress, had taken refuge in the canal villages by working for some one of their own caste for subsistence only. A Chamár or Chúra would not meet with similar assistance from his caste people.

The wanderers I have spoken of consisted of whole families, people old and infirm, able-bodied, and infants in arms.

North-Western Provinces and Oudh.

NORTH-WESTERN PROVINCES AND OUDH.

Mr. Sells.—As far as my experience goes, I should say that *women* and *children* preponderate amongst the first applicants for relief—those, in fact, who are dependent upon their own labour, widows and their children, and orphan children, who may have lived mainly on charity, which is now denied them.

Mr. A. Colvin.—*Chamárs* and weavers. There is no demand for their labour, and the effect is manifest by their leaving their homes and beginning to roam the country. The early applicants for relief are of both kinds. At first men in this district predominated. Both want of labour fund and absence of demand for their labour combine, but in the early stages of famine the latter chiefly.

Mr. Sandys.—The field labourers among the rural population, being chiefly *juláhas, koris,* and *chamárs*, and also the infirm and habitual mendicants, are the first affected; they can get no employment or charity near their villages, and are consequently thrown out of work or left without food; and whole families as well as single individuals take to begging and wander about and crowd the towns, and soon become very importunate in their demands for food. Women and children preponderate.

The field labourers are deprived of employment, as there is nothing for them to do in the fields. When there is no drought their employers have money and grain to spend on their wages; when prices are high and prospects uncertain many of the employers do themselves the work that in ordinary years would be done for them by hired labourers.

Mr. Tracy.—Ploughmen and other day labourers and their families are the first of the rural population to suffer. The stoppage of field work leaves them utterly destitute. They leave their homes, and beg or crowd to relief works if any are open. The first applicants for relief are generally men. They are followed by their families. Until the distress becomes severe, men preponderate; subsequently all sexes and ages are equally represented. The main cause of the distress of field labourers is that their usual employers have no work for them and turn them adrift.

Mr. Mellor.—The agricultural labourers who do not possess lands of their own no doubt are the first sufferers. When there is temporary distress only, and where there is work to be got in the fields (which were the conditions prevailing very soon after relief works were re-opened here in June last), the women and children largely preponderated among the applicants for relief. This was to a certain extent to be expected, as the field work which the rains called into operation, *viz.*, ploughing and sowing, could only be done by the men, and the men therefore stayed at their villages and sent their families to the relief works; but how far the excessive number of women and children on the works is due to the order of Government insisting on a minimum wage being paid to all it is difficult to say.

Mr. Kennedy.—Beggars, unprovided widows, and the criminal classes, all of whom are habitually bordering on starvation, are perhaps the first to feel the pinch of hunger. The beggars begin to wander over the country and crowd into towns, unprovided widows begin to beg openly in the villages, and petty thieves display fresh activity. The delay of the rains for three or four weeks is sufficient to bring this about, but the first symptom of general distress consists in the migration of the field labourers in search of employment.

In 1877 this migration began about the end of July. Individuals first, and then whole families wandered about the country, but hunger and demoralization soon began to dissolve the ties of family or caste, and single individuals wandered about in an automatic fashion incapable of either resolution or thought. To this movement was soon added the class of petty cultivators scarcely above the field labourers in condition.

Mr. Leeds.—The class of agricultural labourers is the first affected, the reason being that the demand for their labour is greatly restricted, and further, that with their scanty means they are unable to procure sufficient food at the enhanced prices.

The early applicants for relief consist very generally of isolated individuals, women and children preponderating.

Field labourers are driven to apply for relief from a combination of both the causes mentioned; there is not only less demand for their labour in cases where it would ordinarily have been employed, but very much less work to be done in the fields by anyone.

Mr. Lawrence.—Day labourers, the poorer handicraftsmen (such as weavers, potters, and cobblers), and tenants without right of occupancy, are the first to be affected.

In ordinary years the labouring classes are employed as reapers, and get as their daily wages a bundle of corn yielding from four to seven seers of grain. When the crops fail, the cultivators, in order to save a few maunds of grain, do what reaping there is to do with the help of their families, or if they employ labourers,

Ch. II. Qn. [illegible]

North-Western Province and Oudh

give them little more than suffices for a day's subsistence.

Ordinary handicraftsmen, such as potters, washermen, carpenters, receive at harvest time certain dues of grain. These are cut down when the harvest is short.

Early applicants for relief consist at first of isolated individuals, and afterwards of whole families, women and children preponderating.

Field labourers are deprived of employment partly because the employers want all the grain for themselves, and partly because the harvest is so light that it can be got in by the cultivator and his family.

Mr. Cornwall.—The rural population first affected by a failure of the crops are the poor non-agriculturists, by whose labour the agricultural classes are supplied with what in ordinary seasons are looked on as necessaries, and in hard times luxuries. After them the agricultural labourers feel it. The cultivator can no longer afford to keep them supplied with food; if he is fortunate enough to have a crop, he attends to it, and weeds his fields himself, carrying home the weedings for his cattle; and if he has not, he goes out to cut grass or canes for them. These men are consequently driven to seek a livelihood away from their villages, and every main road shows, all along its length at such times, scattered parties of two or three, each with his load of grass for sale to the drivers of passing carts: and grass at the usual resting places being insufficient to meet all demands, these loads meet with a ready sale. A subsistence is to a certain extent derived in this manner, but the food thus obtained is insufficient, even when eked out with roots and berries, to keep off hunger. On a relief work being opened these people flock to it.

At first a relief work is attended generally by isolated individuals, and the women and children come afterwards, and usually their numbers preponderate. But there seem to be local circumstances which are liable to overthrow all calculations; for instance large numbers of people last year from the Etáwah district passed through the south of this district on their way to Málwa, their only reason for going there being a tradition that a similar migration took place in the famine of 1837–38. Large numbers of these came from the same village; and though none stayed at the relief work then open on the very border of this district, they may, if pressed by hunger, have applied for relief at a later stage of their journey, and so large gangs consisting of several families may come for relief at once. These people leave their villages quite suddenly and without any settled plan in many instances, intending to settle where they can find fodder for their cattle and get land to cultivate themselves; and any mishap, such as the death or increasing weakness of their cattle, or their own inability to trudge further, may throw them upon relief works. So far as the applicants for relief are field labourers, their application is due to both the causes mentioned. What little work there is to be done in the fields the cultivators do themselves, and the zemindars turn off all field labourers that they can possibly do without, if they are unable to support them. Last year, so far as the zemindars had it in their power they assisted their poorer neighbours with grain; and at these seasons, the wealthy *mahájan*, even though at other times he may be deemed a hard landlord in exacting higher rents than his neighbours, keeps his village better in hand and his tenantry more contented than the penniless *Thákur* community of the next village.

Mr. Webster.—The applicants at relief works are in the early stages of distress chiefly women and children sent there by their husbands; but very soon after the works are open, if pressure continue, the men come in too, and the sexes are pretty equally represented. (This is the result of my personal observation, and I do not generalize on it, knowing it to be far too narrow to carry a theory; but the question was asked and had to be answered.)

Both causes—want of ability to pay wages on the part of employers and want of anything to do in the field—combine to deprive day labourers of employment.

Mr. Stoker.—A proprietor will support and keep together his people as long as he can. He has to do something of the sort in the best of years. In those parts, therefore, I should regard the appearance of unemployed and destitute masses as symptomatic of very severe distress. Again, from the harvesting of the rabi crop till the rains there is comparatively little to be done in the fields. Very large numbers will be found at that time to flock to almost any employment which may be afforded at almost any rates which may be offered, and such a phenomenon does not necessarily mean famine. This was one of the most conspicuous facts to be noticed in Gorakhpur in 1874.

If the distress be severe and general all sexes and ages are fairly represented in their actual proportions. I should consider it a favourable sign to find an undue preponderance of women and children. It would mean that there was still some occupation and subsistence for the men—that it was only the distress of short rations, not of total want—and analogously as the famine ends the women and children linger after the men have abandoned Government relief.

Colonel Reid.—The classes first affected by serious failure of crops are old and infirm persons dependent on their relatives, low-caste field labourers for hire; also artizans, weavers, and professional beggars. Field labourers are affected by loss of employment, arising both from there being nothing to do, and from employers having no money or grain to spare to spend on wages, and consequently doing themselves what in better times they would hire labourers to do for them. One of the first indications of distress is a spirit of restlessness among the sufferers; they have no special ties to bind them to their villages, and move off, both as individuals and in families, to other districts and great cities in search of employment. Husbands frequently desert their wives and families, and women and children decidedly preponderate among the applicants for relief. Children at the breast are the greatest sufferers, and of these numbers die.

Ordinary cultivators as a class somehow manage to pull through one season of severe distress, and, unless their bullocks die (which unfortunately they often do), are able, with more or less assistance from their *zamindars* or village *mahájans*, to resume their cultivation when prospects improve, though a portion of them, varying according to circumstances, sink for a time, if not permanently, to their position of labourers for hire.

Mr. Blennerhasset.—It would appear that on first feeling distress the male members of a family wander about in search of employment, leaving the women and children at home. Women and children usually predominate on all Government relief works, many of the women being unable to state what has become of their husbands. Occasionally a whole family put their property into a basket and wander about together.

S. II. Qn. 2.

Bengal.

BENGAL.

Mr. Barlow.—The class of the rural population first affected by serious failure of crops in this part of the country is the agricultural labourers, comprising Mussahirs, Kallan, Dhanooks, Jalahers, &c. These have little or no land of their own, no cattle, and no ploughs. They work for hire and get their wages in money or kind. These people live from hand to mouth. The harvest time is their season, when they are paid so many bundles in proportion to the crop cut, and they are thus able to lay by a little store, which lasts them for a few months, while work is slack. It is obvious that any failure of the crop promptly tells upon these people, for it takes away their work and subsistence at once. In hard times the expense of labour would be avoided as far as possible, and work done would probably be paid for inadequately.

Mr. Worsley.—The classes which are first affected by serious failure of crops likely to produce famine are musahars, nunyas, weavers, kahars, and generally those classes which live for eight months of the year on manual labour, and earn their livelihood during the remaining four months by reaping crops. Wages being paid in sheaves of corn at harvest time, these classes are at once affected in two ways by a failure of harvest—(1) they are employed for a shorter term than usual; (2) the proportion of grain to stalk which they extract from the sheaves is smaller than usual. The consequence is that the labourers are unable to make their usual savings from their wages, and sooner or later their supplies fail. By reducing their daily consumption of food, and by resorting to unwholesome herbs and roots, they postpone extreme want for a time, but day by day they lose strength and their bodies become thin and emaciated. During this stage an active district officer cannot fail to observe the coming on of distress. In every village which he passes empty sheaves are held out before him, and the villagers complain of their losses and point to the deteriorating condition of the poorest members of their community. The early applicants for relief consist of isolated individuals, and women and children preponderate among them. So far as the applicants are field labourers, deprived of employment, this arises because there is nothing to do in the fields, and because they are without their usual reserve of food.

Mr. Magrath.—The first persons touched are the labourers who hold no lands themselves but work for hire. When the crop fails to come up, or is destroyed, there is no work of weeding, transplanting, reaping, &c. They consequently receive no grain (payments in kind being general), their store from the previous crop is soon exhausted, they cannot borrow money to purchase for they have no security to give, and therefore, unless there are local works going on where they can obtain employment they must starve. This was the case with the musahars in Madhubanni. Another class that suffers earliest is the village artizans who do not happen to have land. Most of them it is true have, but in 1874 we found that the village sonars in Madhubanni in very many cases held no land and were very badly off; the *tantees*, too, being generally landless and poor were very early amongst the applicants for relief.

In the beginning of scarcity the males sell their brass utensils and furniture or pledge them, and leaving the proceeds with the women set out in search of work, either sending for their families when they find work, or sending them back money, generally the former. When the scarcity becomes general the whole family moves together. I have always found the men largely in excess of the women and children. The only class of women who come for relief without a proportion of men are the childless widows, who support themselves during times of plenty by going from house to house husking dhan and grinding atta, receiving remuneration in kind for their work. The field labourers first become impoverished because there is no work to do in their fields. Later on their employers often have no money or grain to advance them if they desire to do so.

Mr. Hodgkinson.—The labouring population, which I have described in my answer to question 2, is the first to feel a serious failure of the crops. The way in which the different classes of society are affected has been well described by Mr. Cockerell (*vide* page 367, administrative experience of former famines). My experience has been that, when relief works are opened, women and children predominate among the comers. The men of the family usually find labour in the fields for a time at any rate; and during an agricultural season I should regard the appearance of a large proportion of men at the relief works (unless indeed the famine had reached a very advanced stage) as a pretty sure sign that they were too attractive, and being carried on to the detriment of the country. The deprivation of employment induced by the class of field labourers arises generally from the restriction employers have to place on this expenditure, and only, rarely, as for instance, in May and June when no rain falls, because there is nothing to do in the fields.

Mr. Mackie.—The classes of the rural population first affected by serious failure of crops are the coolies who perform the actual work of cultivation, who possess no land, and have saved nothing. It being impossible for the ryots to give them ordinary field work, it naturally follows that having nothing to fall back on either in the shape of land, which they could mortgage, or in money saved, they are the first to feel the pinch. I should say women and children largely preponderated among early applicants for relief, for not only have most men some such dependent on them, but cases of desertion are very frequent. As regards the second part of this question, I should say that distress arose because there is nothing to do in the fields, and not because the ryots have no money or grain to spend on wages. I doubt whether the ryots do not almost always have large stores of grain concealed, for every village fire that I have witnessed either in Nellore or Tirhoot, disclosed very large stores, the existence of which had been strenuously denied by every villager.

Mr. Henry.—Of the rural population the following classes would be the first to be affected by the failure of crops:—

1st. Daily labourers tilling no land of their own.

2nd. Cultivators with small holdings.

3rd. Farm servants permanently entertained by the well-to-do cultivators.

Where there has been failure of the crops the employment of labour for reaping the harvest will be less in proportion to the extent of this failure.

In this district one sheaf in every 10 is allotted to the reaper. In other words, a wage fund, equivalent to 10 per cent. of the harvest out-turn, is available for the employment of labour. Consequent on failure of the crops the harvest out-turn is less, and the wage fund is proportionately diminished; the first therefore to feel the effects are the expectant reapers, amongst whom the daily labourers largely predominate.

In ordinary years cultivators with small holdings are able, to store, after paying landlords and mahajans, just sufficient to keep them during the winter harvest period before the next crop.

In bad years this out-turn is below the average and the residue they have for storage is insufficient for their food during the whole inter-harvest period. The time when they begin to experience scarcity is nearer or more remote, as the failure of the crops has been more or less serious.

In very bad years the more substantial cultivators find that their surplus is insufficient for the wants of their households. For self-preservation they are forced to practise economy by dismissing some of their farm servants. This rarely occurs I believe, the servants being so bound up with their master's interests that the latter will make considerable sacrifices to retain them; but still it does occasionally occur.

The farm servants, deprived of the daily food they had hitherto received swell the number of those seeking employment. The district officer who, from other indications, will have already made a forecast of the conditions of the people, is not unprepared for the applications for relief which will now be made to him.

So far as my experience goes, early applicants for relief are isolated individuals; numerically men one in excess of women, and the latter much in excess of children.

As already stated, the first immediate cause of distress is the smallness of the harvest; there is less grain to spend on wages, because there is less work to be done. Later on, employers having no surplus grain or money employ no labour.

The experience gained from the famine of 1874 shows that, as soon as the time for agricultural operations comes round, there is a sufficient wage fund available, even during a period of great distress.

With the setting in of the periodical rains in Tirhoot in the summer of 1874, thousands and tens of thousands left our relief works to return to their villages.

Mr. Metcalfe.—The earliest applicants for relief are chiefly aged or middle aged women of the lower castes with children, who preponderate among the earlier applicants.

Mr. Kirkwood.—I believe women and children to form the majority of the earlier applicants for relief. That this should be so in the lower classes, when they have no adult male relative on whom to depend, is easily conceivable. When in the lower labouring classes they have such male relatives it often forms one of the first measures taken by the head of the house for weathering the storm to get the children and then the women supported, while he tries to earn something somehow for the maintenance of himself and such of his family as cannot be sent forth to beg.

Mr. Brookes.—The ordinary agricultural labourers and their families, whose employment depended on the prosperous condition of the growing crops, are generally the first to suffer. This is manifested by unusual numbers of women and children to be seen collecting tank weeds, roots and seeds of grasses, and other substitutes for the grain they have no longer the means to purchase or the credit to obtain without payment. They seldom at the first stage of distress resort to begging.

The early applicants for relief consist more frequently of women and children; later on all ages and sexes are equally represented.

Field labourers out of employment are mostly so because work in the fields is not required, and seldom for the want of money or grain.

Mr. Abbott.—The regular mendicants and the poorer class of cultivators suffer considerably more than the mere labouring classes, for whom the indigo factories and other industries and trades generally have employment sufficient to prevent actual distress during first stages of famine. To a planter one of the first signs of hard times is the noticeable increase of women coming to field work. The labouring coolie seldom applies for relief before Government has itself seen the necessity of helping him. The cultivating ryots, unable with the prospects of a poor harvest to raise money from the village *mahajun*, are forced to do without hired labour what field work they may have; hence the coolie must turn to the larger capitalists and industries alone for maintenance.

The *Bawan* and other Hindoo petty cultivators suffer most, for they will neither beg nor work for others until very badly pressed. Every *zamindar* or *ticcadar* in the district should, when famine appears inevitable, be called upon to furnish an estimate showing the amount of loan necessary to keep off actual distress from each family of this sort living on his property; and himself conjointly with his tenant be held responsible for the future repayment of the advance, the land and property, moveable and immoveable of both, being mortgaged to Government as security.

CENTRAL PROVINCES.

Central Provinces.

Mr. Nicholls.—Experience has shown that in Chhattisgarh the agricultural labourers and the lower ranks of the cultivators are the first to suffer.

In the rest of the province (putting aside the mendicants) we have seen that the spinning and coarse-cloth weaving classes, especially those who for a part of the year engage in field work, are the first to suffer.

In Chhattisgarh these agricultural classes have no other occupation and now no field work to do, no credit and no resources.

Among the spinning and weaving classes, the people will be disappointed and losers by not getting the expected cash payments for labour in the fields. The ordinary demand for their coarse produce would not provide for them during these weeks in their spinning and weaving occupations, and they become unremunerative consumers of food. In addition to this, the normal demand for thread and coarse cloths, ordinarily at this season too small to employ them, will rapidly contract as the prospects of the season grow more gloomy and as food grows dearer. Generally agricultural labourers would be reduced to distress, only in cases where employers could find no work, even at a loss to themselves, on which to give employment.

In regard to the early applicants for relief, their sex, age, &c., my experience is not wide or recent enough to enable me to answer decidedly. In Jubbulpore in 1869, many men seemed to have gone away to earn money on the railway works in the Nerbudda Valley, leaving their women and children to struggle on or to be supported by us. In Dinagepore, where we kept ahead of famine, the village headmen, mandals, and others, used to give us warning when the people in any particular tract were likely to break down without relief by employment. There will in these provinces be begging by classes who are generally independent, by men, women, and children, long before any applications for Government inteference are made. And I should expect first of all not the applications of individual sufferers, but recommendations for the giving of employment, coming from the leading malguzars and municipal committees, by the tahsildars and police officers.

BOMBAY.

Mr. Spry.—The smaller cultivators and the day labourers are the first among the rural population affected by serious failure of crops. The former are entirely dependent on their annual crops, and therefore the loss to them is immediately manifest. The latter are unable to get the daily labour on which they depend. Further, the drought would probably have killed all the green grass growing in fields, and therefore these day labourers would be unable to get a livelihood by gathering and selling that in the bazaars.

The effect is manifested by increased application for employment.

The beggars, who generally subsist on charity, are I think the first applicants for relief, as they find that charity drying up. Then will come the able-bodied labourers, &c., and if there is a chance of getting work close at hand, they will come in families so that all may get put on. When they come thus there is of course the usual proportion of women and children. Often, however, a man who can himself pick up work will send his family.

In this district I take it that the want of employment during the earlier stages of the last famine arose from there being nothing to do in the fields. Employers locked up their capital as all expenditure would be unremunerative.

Mr. Charles.—Beggars of all kinds and day labourers are the first to feel the effects of serious failure of crops. The dole of handfuls of grain to beggars is put a stop to as soon as people fear their stocks may run out, and no labourers are employed in weeding when the *ryots* see reason to think the labour would be in vain. The early applicants for relief are more often isolated individuals, each family sending away such members as can be spared from the house.

Men chiefly seem to come at first, but I cannot say I observed any definite custom.

Field labourers come on the works because there is nothing to do in the fields. If one year's crop has been sown but does not come up there is nothing that can be done till next cultivating season comes round, and all the work the field labourer has usually, in weeding, hoeing, watching crops, and in reaping, is entirely stopped.

Mr. Propert.—Agricultural labourers and inferior cultivators, as well as the village artizans, &c., who are dependent for their livelihood on the cultivating classes.

Field labour ceases, and the labourers cannot get employment. Artizans fail to obtain their grain allowances from the cultivators. *Saukars* at once refuse supplies of money or grain, and the poorer classes commence wandering in search of work. The authorities are besieged with applications for relief, and work has to be provided.

As a rule the earliest applicants consist of individuals, except in the case of Bhils and such wild classes who proceed with their wives and children to the nearest official, clamouring for work or relief.

I have noticed that, amongst those who merely wander for the purpose of begging, women and children preponderate. The males generally ask for employment.

Field labourers are deprived of employment simply because there is no work in the fields. If there were any work at all employers would not turn off their labourers, but would retain them even at reduced wages.

Mr. Ramsay.—So far as I have seen, coming distress is first manifested by a large increase among the begging class, mostly old, sickly, and infirm persons. Next labourers and others depending on doles at harvest time begin to clamour for food or employment, but no doubt a great deal of distress is endured before it comes to light. When distress arises from failure of rains, it is of course chiefly owing to want of work in the fields, high prices, and scarcity of grain in the houses of the people, and the stoppage in consequence of petty charities and doles of grain, upon which so many old and infirm persons depend. The closing of the labour market is of course the chief cause of distress, as labourers have no credit on which to borrow or buy.

Mr. Norman.—The classes of the rural population first affected are the lowest castes, comprising *Mhars*, *Mhangs*, and to a lesser degree, *Ramoshis* and the poorer classes of *Kunbis* who are without lands of their own, and usually subsist by day labour. These are affected by a stoppage in the demand for labour and by a general rise in prices. The early applicants for relief consist chiefly of women and children, accompanied by those who are too old to work. Occasionally whole families present themselves. Field labourers are deprived of employment, because there is nothing for them to do in the fields.

Mr. Hamilton.—The people first affected appear to be labourers who earn their livelihood by weeding the fields after the young crops have appeared. With them are the lower village servants, who receive payment in kind from the villagers in return for various offices performed, such as watching the fields at night, &c. If no steps were then taken to open relief works these people would emigrate in search of work to places where they heard good rain had fallen, but village servants generally remain in their villages much longer than mere labourers. These latter have no claim on cultivators who have no crops to be tended. Women and young children seem to be the first to clamour for relief.

Mr. Moore.—I have answered the first and second questions in the paragraph above.

The early applicants are isolated individuals, but if there has been a serious failure, mothers and children appear, the men having gone in search of labour.

Because there is nothing to do in the fields, and because those who have money and grain hold both back.

Mr. Robertson.—(*a.*) First the professional beggars.

(*b.*) Next the *Mhars* and *Mangs*.

(*c.*) Then the agricultural wage labourer.

(*d.*) Then the less well-to-do cultivators and all the poorer classes who live by wage, but owing to dear prices do not obtain employment. Employers of labour at such times become careful to curtail all expenses.

They are affected—

(*a.*) By getting less from charity.

(*b.*) By the cultivators who generally aid and employ these people in some way, refusing to give them grain.

(*c.*) By their being unable, owing to cessation of field labour, to obtain employment and earn money to buy food.

(*d.*) The poor cultivators, owing to their being generally in debt, to their having no stocks of grain for home use and thus being reduced to want. The poorer classes generally, owing to there being no employment, and thus being unable to earn money to buy food.

Early applicants for relief generally consist of parts of families. Women and children preponderate, but not very greatly.

So far as the applicants are field labourers deprived of employment, this arises chiefly—in fact, almost entirely—because there is nothing to do in the fields.

MADRAS.

Mr. Whiteside.—Petty landholders are the first to feel severely the effects of a general failure in crops. They do not usually work themselves, but superintend the cultivation of their little holdings by a few pariahs or people of other low caste, whom they employ on small monthly wages, usually paid in grain. When these people's crops fail, and there is a general rise in prices, they dismiss their workmen (who for some time will be able to find employment in other ways sufficient to support themselves) and reduce their expenditure to the lowest point. If the scarcity continues and their stocks of grain become exhausted, they then sell their cattle, reserving the ploughing bullocks as long as possible. Afterwards their little hoards of money are fallen back upon, and then the jewels of the family, after which the brass and bell-metal household utensils are sent to the pawnbroker, and finally lands and houses are mortgaged or sold.

Whole families do not at first appear in search of subsistence. The older members of a family begin to go out and beg. The adult males then wander away in search of employment, and it is not until the famine is thoroughly established that entire families will quit their homes and go to any distance. During the famine, the numbers of women and children largely preponderated often to such an extent as to cause much inconvenience. The men, in many cases, stand about the villages, looking after cattle, doing scanty jobs of work, and always on the look-out for any casual fall of rain that would enable them to begin to cultivate. Throughout the famine it was a notable fact that, after every good fall of rain, the numbers of adult males on the relief works fell off at once, and the men hastened to their villages to see what could be done in the fields.

Mr. A. McC. Webster.—The agricultural labourers, petty artisans, weavers, and the smaller class of ryots.

The ryots are affected by the loss of their crops on which they depend for their support, and the balance of which is sold to pay the Government revenue; the petty artizans and weavers are affected by the slackness of trade owing to high prices and consequent necessity of the people to spend what they have in supporting life; and the agricultural labourers are affected (and sooner than the others) by want of demand for labor in the fields owing to there having been no cultivation operations (ploughing, sowing, and weeding), to there being no demand for harvest labour, and to the ryot's inability to pay for labour. The habitual beggars also are affected very early in the day by the cessation of charitable relief owing to the inability of the people to look after others than themselves.

The effect is manifested in the distressed people wandering, in the increase of beggars, and in the people eating the fruit of the prickly-pear plants and the seeds of grasses and trees, also by a general backwardness of collections and by the sale of jewelry, cattle, &c.

Females preponderated at the commencement and have continued to do so all through the famine. At the height of the famine, however, the number of children exceeded that of women.

Both because the employers have no money or grain to spend on wages, and because there is nothing to do in the fields.

Mr. Price.—The classes of the rural population first affected by famine are the ordinary cooly-labourers, especially those of the Pariah and Woddah (navvy) castes. These men are occasionally petty holders of land. The rain fails, they have had a bad crop the year before, they are "hand-to-mouth" people, and very soon get through what little grain they may have hoarded up in store, and dispose of such of their property as is saleable; they have nothing to do in their own fields, there is no ploughing or reaping work to speak of, and what there is, is done by the ryots and their own establishments. The next class to feel distress is that which supplies the ordinary wants of the cultivators, who very soon cut off any thing not absolutely necessary; the largest section of this, which is scattered over the country, is the weavers. Some of these combine agriculture with their usual avocation, and when not working in their fields weave cloths for hire, the employer finding materials. Distress very soon puts a stop to their professional employment, and they have to fall back upon labour. Others of the weavers, who are simply artisans, sell up all they possess. During the famine a very large proportion eventually found their way into poorhouses (relief camps) and on to village-relief.

The petty farmers come next, and then the servants of the better-to-do ryots, who are obliged, as a rule, to economise and, as a first step towards this, to send adrift the labourers for whom they have no longer occupation. The way in which the classes alluded to above are affected by any serious failure of crops is in a curtailment of their food to such an extent as to produce a visible falling off in condition, which is first to be observed amongst the young children. Not only is the effect manifested in this patent way, but if relief is not given, offences against property increase. The early applicants for relief neither consist, as a rule, of whole families, nor of isolated individuals. My earliest experiences of relief measures were in connection with works alone, and I cannot recall a single instance out of many thousands in which a whole family came on the works. Isolated individuals were certainly numerous, but, generally speaking, there were two or three of a family. Some one was left behind to look after the house, &c., and others had, for a time, employment elsewhere, and it was not until the pressure of the famine increased very considerably and the people had deserted their homes in search of work, that whole families applied for relief. Women and children all through preponderated in poorhouses and on works and village relief. The moment that rain came the bulk of the men who could work went away to the fields, leaving the women and children on relief works in such disproportionate numbers that it was often difficult to find suitable employment for them. Adults, both male and female, from about eighteen to thirty, as a rule, form but a small proportion of the applicants for gratuitous relief. During the late famine they were to be chiefly found on works. As regards field labourers deprived of employment who come upon relief, the first and largest batch comes on to the hands of the State, because there is nothing to do in the fields; the second and smaller section is almost entirely made up of the farm labourers usually employed all the year round by the ryots. These men are turned off by their masters because they can no longer afford to support them.

Mr. J. G. Horsfall.—Field labourers who work for daily hire are the first to suffer from failure of crops. Agricultural operations cease with failure, and their ordinary means of livelihood is thus wanting. Failure of rain in the first instance prevents ploughing and sowing. The land remains waste. The ryot, the usual employer, has no need of his field labourer, and if he has hitherto been paying him daily hire dispenses with his services without further ado. Such labourers usually live from hand to mouth, and are consequently compelled to wander elsewhere in search of labour. As distress increases, the ryot dispenses even with his permanent servant, the paleru, whom he finds himself unable to maintain. The desertion of home and village seldom takes place till all credit is exhausted and all saleable property disposed of. Meantime their scanty food is eked out with roots, leaves, and fruits that are never thought of in ordinary years. Resort is had to grain pilfering, cattle mischief, robbery, and dacoity, and the Crime Register shows generally a large increase in crime. The first applicants for

H. II. Qn. 2.
——
Madras.

relief are men wandering away in search of work and leaving their families at home. Finding that work is not procurable, he returns to take his family with him in search of relief whether by work or charity.

Field labourers consist of two classes—those who are hired by the day, and those who are hired by the year or more permanently still. The first class are turned adrift the moment the ryot no longer requires his services; the latter are retained until the ryot becomes apprehensive that his stock of grain will not suffice for the wants of his own family. This latter class is looked upon by the ryot almost as his own property, and is only discarded when the ryot is forced by his own necessity to do so, just as he parts with his cattle for a mere song, or even for nothing at all.

Mr. Soobien.—In the case of labourers, absence of field and other work and consequently the absence of earnings to buy food, with no property to sell, follow as a result of a serious failure of crops. The failure of crops raises the price of food grains and places the quantity requisite for his subsistence beyond the reach of the purchasing power of his wages which, owing to absence of work, a glut in the labour market, and want of employers, are materially diminished. Thus a failure of crops operates in two different ways on the labouring class. It diminishes their earnings and lessens their purchasing power. The effect is manifested in the reduction of the quantity of proper food, in the recourse to unwholesome food, and in the consequent gradual emaciation of the body. Want of work in the vicinity of their homes compels them to seek for labor elsewhere, and this leads to emigration. Movement of bodies of labourers from place to place is also an effect of the failure of crops. Further, when honest labour becomes scarce and is difficult to be had, other ways, no matter they are dishonest, for appeasing the cravings of hunger are thought of, and this leads to lawlessness and crime. As regards the begging class, who ordinarily lived on the bounty of their neighbours, they find it extremely difficult to live such a life in a year in which there has been a serious failure of crops, and their clamor for food therefore becomes very great.

When distress has began to be felt the members of a family begin to disperse in different directions, and it is only on rare occasions that the applicants for relief consist of whole families.

When things come to such a pass that through want of work in the neighbourhood the adult male members of the family quit their homes and emigrate to different places, then it is that the women and children left behind them preponderate among the applicants for relief.

Both causes, viz., want of work in the fields and want of means on the part of employers, contribute to deprive field labourers of employment, but the cause of the employers having no money or grain to spend on wages operates, I think, to a comparatively less extent. If the employers see that there is the slightest prospect of a favorable season, there is usually no lack of interest on their part in commencing agricultural operations. They raise money somehow or other and employ the labourers.

Seetharamiah.—Agricultural labourers and artizans are first affected, and next agriculturists of small holdings; the former by being deprived of field employment, which is the only means of their daily livelihood, and the latter by want of grain in store and by want of money to buy it from elsewhere. Both classes of people are therefore obliged to dispose of their household chattels and live stock, and then leave their homes in search of work elsewhere, or assume the profession of beggars or commit petty thefts. If they cannot by these means successfully earn their livelihood, their physique is deteriorated, and gradually sickness prevails, and mortality increases. In the beginning of distress applicants for relief consist only of isolated individuals, and gradually of whole families when they find that they cannot live otherwise. Among the applicants for relief women and children generally preponderate, their proportion of the population being naturally greater. This being the early stage of famine, it is more on account of want of labour in the fields than want of money in the hands of employers that the labourers are deprived of employment.

Major Baynes.—(*a.*) Those who live from hand to mouth, that is, those who are dependent on daily receipt of food or of wage for their daily expenditure, such as cowherds, hawkers of grass, of greens, of curds, and of fuel, &c.; the first four, through failure of their stock in trade, are compelled at once to adopt some other means of earning a livelihood; the latter can only earn a bare subsistence under normal conditions; but, as soon as the price of grain permanently rises, that of fuel falls because the rich men will not pay even the usual price of it, so that in large country towns it was sometimes unprocurable, and these classes were driven, at a comparatively early stage of distress, to maintain themselves on grass seeds or by acceptance of State relief on works, in poorhouses, or in their villages.

(*b.*) Rarely in family groups; the larger number consisted of elderly women, chiefly widows, unmarried girls, and children of both sexes, who in one of the ways described above had been contributing to the family purse, and also of infirm paupers who had previously been maintained by their relations or by public charity.

(*c.*) Applicants and recipients of relief were of all ages, but the women and children greatly exceeded the males in number. I am unable to have recourse to returns, so speak from memory, but I think that I am accurate in stating the ratio of women to men on gratuitous relief was two to one, and of applicants for employment on relief works as eight to one. The preponderance of female applicants for work was so great that it was impossible to employ them all except at a dead loss to the work, and more specially to the *male* workers, because, when payments are made on tasks, directly a *superfluous* agency is employed, the receipt of each person engaged to perform that task is diminished. I have seen one hundred women and children clamorous for employment, but not a single man amongst them, and women would often work as men with mometies and pick-axes on women's wage sooner than be turned away. The number of children on works averaged, I think, about 25 per cent. of the adults, but on gratuitous relief and in kitchens they were nearly equal in number to the total of both sexes of adults.

This state of affairs to European experience seems strange, but is, I think, to be accounted for in several ways—

(1.) That at all times women in this country perform more manual labour than the men as field labourers, weeding, planting, and picking crops, as carriers of burdens, as suppliers of grass, fuel, and water; whereas the men are too indolent and too conceited to work at any task which custom has specially allotted to the women, and, as these embrace nearly every ordinary avocation of life, the men have not much left to do.

(2.) Fifty per cent. at least of the women under forty had been abandoned by their husbands or the men with whom they had cohabited prior to the distress.

(3.) Every woman in this country is a mother who is capable of child-bearing.

(*d.*) As far as actual labourers are concerned, because there is nothing for them to do in the fields.

Mr. Longley.—Of the urban population, the cooly artizans and other cooly classes (*e.g.*, the blacksmith dispensing with his cooly-bellows-blower on account of high prices) are the first to feel the effects of famine by loss of employment consequent on diminution of proper food.

By final deprivation of cereal food and resort to

noxious herbs, &c., or alms to sustain life and a tendency to wander aimlessly away in search of livelihood, &c.

By local inquiries through Municipal and other local agency, thereby giving timely employment and thus preventing their tendency to wander.

MYSORE.

Mysore.

Mr. Ricketts.—The poorer or hand-to-mouth ryots and labourers and minor village servants, such as toties, taliaris, nirgantis, &c., who mainly depend upon their meeras or grain dues from ryots, and these dues in times of famine are naturally almost nil, and then come petty artizans and weavers, who in fact can earn nothing at such times; also gollurs and even wudders. It is not clear why gollurs should suffer so much unless it be on the supposition that their live stock is almost unsaleable in famine time. As a rule it may be said that those classes of the rural population suffer first and most who earn their livelihood apart from tillage and harvesting of crops.

The early applicants for relief consisted mostly of isolated individuals. Adults predominated over children. Females exceeded males in number mainly because there is nothing to do in the fields. Only the rich or exceptionally benevolent would or could go on feeding their field labourers when no equivalent was to be obtained in shape of their labour.

QUESTION 3.—CLASSES OF THE URBAN POPULATION FIRST AFFECTED.

Ch. II. Qn. 3.

What classes of the urban population are the first to feel the effects of famine, and in what way do those effects operate on them, and how do they manifest themselves? How may they best be watched and met in their first stage?

Punjab.—7 replies are given to the same effect. Distress in towns arises later than rural distress.

North-Western Provinces.—27 officers have answered. Chamars (leather workers) and weavers are first affected, because there is no demand for their wares. Relief works, municipal works, purchase of the cloth woven by Government are recommended.

Bengal.—14 officers have answered. Weavers and petty artizans; beggars. Many officers do not answer, others say they have had no experience of distress among urban populations.

Bombay.—10 officers have answered this question. The general opinion is—That the classes of urban population which first suffer are labourers for wages and petty artizans, especially weavers, the demand for whose wares ceases. Municipal committees may keep watch and assist these classes, perhaps by giving them employment in their own trades, or on municipal works.

Madras.—To this question 20 European and 2 Native gentlemen have replied.

The persons residing in towns amongst the classes who exercise trades and industries who first feel the effects of famine are artizans, weavers, potters, brick-makers, &c. Here, as in rural populations, the demand for their industry is diminished; the journeymen are dismissed, and later on the master workmen feel the pinch. In large towns Mahomedans and Brahmins, who in ordinary times subsist on the produce of lands leased out to cultivating ryots, or on the gifts of the pious and charitable of their respective persuasions, suffer severely, as do also professional beggars and religious mendicants.

PUNJAB.

Punjab.

Captain Wood.—The temporary scarcity in this district has not sensibly affected the urban population beyond the inconvenience attendant on high prices.

Colonel Parsons.—(*a.*) Of the urban population, weavers, sweepers, mochis, and other artizans. (*b.*) Earth works performable by persons of any occupation opened as near as practicable for their employment.

Mr. Coldstream.—The classes of the urban population which are the first to feel the effects of famine are the town mendicants. The usual doles of grain are restricted when scarcity begins, and the beggars feel the pinch immediately. They betake themselves to the poorhouse if they are allowed a dole there. The increase of applications at the poorhouse, if under reliable superintendence, is one of the earliest tests of scarcity in a town and its neighbourhood; and indeed I am inclined to think that the number and urgency of applications for relief at the poorhouse is, throughout a period of scarcity, one of the most reliable means of gauging the condition of the people. But, in order that this test may be properly applied, the superintendence of the poorhouse must be careful, intelligent, and independent.

The poorhouse at Hoshiárpur, which is under superintendence of the Rev. Mr. Chatterji of the American Presbyterian Mission, receives Rs. 100 per mensem from municipal funds, and, since the scarcity began last autumn, Rs. 50 per mensem extra have been granted from district funds.

It has been a most valuable agency, and itself constitutes an efficient test of the pressure of high prices.

In the milder forms and earlier stages of scarcity, I consider that increasing the grants to existing poorhouses and starting fresh ones is the best way to meet it.

Mr. Roberts.—Distress arising from drought does not so soon make itself felt in towns, where the trading classes are not so directly dependent on the produce of land, and have no fixed rent to pay, whether the crop is good or bad. The poorer classes of artizans are first affected. For instance, last year there was a dearth of cotton; the raw material rose in price enormously, and the cleaners, spinners, and weavers lost their employment and means of livelihood. In the same way an unaccountable stagnation in the shoe trade at Delhi affected the Mochis, Chamárs, and Khatíks throughout the district, and reduced great numbers of them to extreme destitution. These classes emigrate, and turn to other employments, or else subsist by begging. They have no one to represent their condition, and in large towns it is not easy to ascertain the extent of their distress. The Zaildár system does not apply here, and some special organization is necessary. Where municipal committees exist they might be utilized for the purpose.

NORTH-WESTERN PROVINCES AND OUDH.

Mr. Sells.—Of the town population, *chamárs* and weavers are the main sufferers, at all times a poor class.

Mr. A. Colvin.—Weavers, hangers-on, menial servants, poor relations, chamárs, small artizans, first feel the strain. By opening employment, municipal if possible.

Mr. Sandys.—The *juláhas*, *koris*, and *chamárs*, the infirm and habitual mendicants, are also the classes of the urban population that are the first to feel the effects of famine. The majority of them in ordinary years obtain a livelihood by manual labour and begging; some, however, eke out an existence by weaving and shoemaking. When prices are very high there is little demand either for manual labour, cloth, or shoes, and almsgiving is much restricted; and the classes named above suffer in consequence and are thrown out of employ or deprived of their ordinary means of subsistence, and consider themselves fit objects for gratuitous relief by the Government, and clamour for it, being most unwilling to make even the smallest return when it is given to them. As soon as it has been found necessary to start relief works in any district the magistrate of the district should be empowered to draft off to them all persons found begging in the streets of the towns and capable of performing work, whether they are willing to go or not. At first a very light task-work should be exacted from them, and as they became more accustomed to it the task should be gradually increased. If the number of aged and infirm found wandering about the towns is large, and prices are so high that there can be but little given in the way of charity, a poorhouse should be opened at the head-quarters station, and afterwards at each *tahsíl* as the distress becomes severe.

Mr. Tracy.—The effects of famine in towns are first felt by labourers and the poorer artizans, such as *júláhás* or weavers, *chípis* or calico printers, and *chamárs* or leather workers. They are thrown out of work and generally take to begging and theft, and often commit riotous attacks on the stores of grain dealers. Early commencement of relief works is the best way to check this state of things.

Mr. Mellor.—Of the urban population the *julahas* are among the first to feel the effects of famine. There was a great number, I know, in the Bareilly poorhouse last winter. These people were quite willing to work on being provided in the poorhouse with looms. Their own looms, they said, they had sold to buy food before they applied for relief, and there was no doubt of the truth of this, as I offered to buy or hire their looms for use in the poorhouse.

Mr. Kennedy.—The urban classes of weavers, pedlars, and others who depend upon the agricultural community are the first to show signs of distress, as their wares are the first superfluities with which the agricultural community can dispense. As the distress spreads upwards it affects all the retail dealers, except grain sellers. The city labourers are affected not by the agricultural distress as weavers and pedlars are, but by the contraction of expenditure which high prices and small incomes create among the middle urban classes.

On the other hand the demand for expenditure of food to the country may cause an increase of trade, or such an increase of wholesale trade may be due to extraneous causes independent of a famine, and this may bring about a prosperity which more than recompenses the loss due to the failure of the agricultural community. This was to some extent the case with the Sháhjahánpur city. The town population consists of a large landlord and money-lending class, and a very considerable trading class. The trade in grain and other produce swelled so much last year, partly on account of the famine and partly for other reasons, that it preserved the greater part of the city from any serious loss, and gave occupation to a large number of labourers. Even the weavers of the town suffered little, although their country brethren suffered severely.

The town weavers are chiefly engaged in the manufacture of fabrics for foreign markets, and therefore are not affected by the failure of agricultural society. The exports of native fabrics manufactured in the towns of Sháhjahánpur and Folkur only declined 25 per cent. while the village weavers were reduced to beggary. In the country towns of the district they manufactured only for local consumption, and therefore suffered as much as the weavers in the villages. The different fate of the Sháhjahánpur and the country town or village weavers illustrates the close connection between the pressure of famine and the economic relation between the town and the country. Another illustration of this may be found, in fact, that there was a general stoppage of trade in all articles of local consumption except grain. So far as this grain was imported from other districts it had to be paid for in cash or by exports. Accordingly when the rabi of 1878 was reaped an unusual quantity of oil seeds and wheat was exported.

Mr. Whalley.—The first class of the urban population which feels the effect of famine is the weaving class. The cloths they weave are purchased mostly by the cultivators in the neighbouring villages. A bad season leads the cultivators to economize first in the simplest and most practical fashion, in the purchase of clothes. The weavers' trade at once begins to stagnate. First their coarse cloths remain on hand and they cannot get rid of them. Very soon their necessities compel them to reduce the price of their goods, and this process goes on until the price of manufactured cloths sinks almost to the price of raw cotton, and there remains no possibility of earning a subsistence by the manufacture. The relative prices of cotton thread and manufactured cloth fairly measures the pressure of a bad season on the weaving class, and the only thing that can be done is to stimulate trade by Government purchases, which can be distributed for cloths to the paupers in the poorhouses, or made into tents for them, or reserved for after sale.

Mr. Lumsden.—The classes among the urban population who are the first to feel the effects of famine are the petty artizans and small traders, together with the class who earn a living as hired labourers. To these must be added the class who in England would be styled indigent gentlemen and women, natives of the upper classes who have seen better times, but who, some from circumstances beyond their control, others in consequence of their own conduct, are now in the best of times hard pressed to make ends meet, and to a great extent dependent on the assistance of relatives and friends, in the social scale to which they originally belonged, for the ordinary means of subsistence.

The regular pauper class of our towns and cities are of course also among the first to feel the effects of famine, for as sure as prices rise to what may be considered famine rates, the class on whose charity our town beggars are mainly dependent infallibly contract their purse strings, if they do not close them altogether. This is, I think, a peculiarity of ordinary native charity in this country; a threatened famine and the existence of widespread distress, which at home would give an *impetus* to private charity among all classes able to assist, have in this country quite the opposite effect.

It is not difficult to watch and be prepared with suitable measures of relief for distress among these classes of the urban population. Distress among them will at once attract the attention of the local authorities, and may for a time be met by offering employment at subsistence rates on ordinary local district and municipal works; but these will not suffice if the pressure is long continued or there are symptoms indicative of approaching famine. With the presence of work for those able for it, it will very soon be found necessary for Government, if their lives are to be saved, to afford relief to the professional beggar class, the aged, the lame, the halt, the blind, and other mendicants incapacitated from bodily infirmities or age from doing anything to help themselves. The only class among the urban population among whom it is necessary to be specially on the watch for symptoms of distress is the indigent or broken down men and women who belong to the upper classes, who will often put up with extreme privation rather than make an open appeal to public charity of any sort. Distress among this class can be best watched and dealt with through the instrumentality of native gentlemen, official and non-official, who should be charged with the supervision of the muhallas of the town or city, with the circumstances and residents of which they are each best acquainted. As a rule, however, I believe that distress calling for Government assistance will not be felt quite so early among this class.

BENGAL.

Bengal.

Mr. Barlow.—Amongst the urban population, weavers, *koeries*, *gwalas*, artizans, and poorer families of the better class first feel the effects of famine. At the same time that prices are high the richer classes become economical, and country manufactures are at a discount.

Mr. Magrath.—The labouring class, I mean those who have no trade but who carry loads, or help in any work that is going on, are always the first to come on relief (amongst them the childless widows I have spoken of), and soon after them the tantees and artizans who work only for the poorer classes, then the kunpas and petty tradesmen who deal entirely with the poorer classes in a small retail way.

For the labourers there is nothing to do but to put them to work at repairing roads, clearing out drains, cutting grass for fodder, and the like.

The artizans may be employed at their usual trade, materials being advanced and the labour paid for; the manufacture being sent to some prosperous places for sale. Old women can always spin yarn, and, if any relief is being given, can be employed in husking and cooking rice.

Mr. Kirkwood.—Weavers and petty artizans are the first of the urban population to feel the effects of distress. Lord Napier (1866, Ganjam) well wrote of them:—"It is obvious that the same causes which
" suspend the employment of labour in the country
" must also affect the welfare of those who live by
" small trades and manufactures. In this climate the
" necessaries of life may almost be restricted to fire
" and food, and the purchase of its simple comforts
" and ornaments can easily be deferred or abandoned.
" The dearth and dearness of provisions would alone
" account for the depression of industry in the
" towns."

BOMBAY.

Bombay.

Mr. Hewlett.—Among the urban population the small artizans and traders, such as weavers, potters, tailors, and such like, are, in my opinion, the first to feel the effects of famine. The demand for their particular manufacture or trade falls off and gradually dwindles until they are obliged to pawn or sell the very implements of their trade. Many cases of great distress among the Mahomedan weavers in towns and villages came to my knowledge during the famine. Even if the men leave in search of manual work, which they are not fitted to perform, the women remain behind, being generally *purdanishin* women, and suffer great hardship. I have known cases where the women and young girls who in ordinary times never leave the house have sought for employment at relief works to get food. In my opinion the only way to watch them is to employ Musalman inspectors to go round and visit house by house.

Mr. Spry.—Amongst the urban population the day labourers and the smaller artizans are the first to feel the effects of famine. Trade becomes slack, and the employers of labour reduce their operations. Hence those depending on their daily wages and those who have no resources first suffer. The labourers begin seeking relief work, and the artizans begin mortgaging their tools and implements.

The municipal committees, if they exist, are the best means whereby at the early stage of famine the urban population may be watched. Municipal works might also be opened for the labourers; and for the artizans, such as weavers, employments may be given them by the municipality by commission. At this stage, too, measures for yet further relief will be probably in contemplation, and the district authorities can usefully employ *lohars* in making hoes and picks, *sutars* in making their handles, and basketmakers in making baskets.

Mr. Propert.—The small manufacturers and labourers. In Khandesh the former are represented by poor Musalmans and *mhars*, who weave cheap and inferior cloth. The demand for their wares ceases, and as the above-named classes lead a precarious existence even in favourable years, any serious rise in the price of food quickly reduces them to the condition of paupers. In the first place they resort to begging, and subsequently they betake themselves to any small local works that may be available, but as a rule they prove to be very inferior as road labourers.

Where municipalities exist considerable relief may be afforded in the early stages of distress to the very poorest classes by the purchase of grain on the part of the municipal committee in the cheapest markets, and the retail sale of the same at cost price. Loans of grain or money without interest on the part of the richer merchants to the charitable committees are also very useful. It will generally, however, be necessary to start some small works from municipal or local funds at an early stage of scarcity, upon which the pay is merely sufficient to enable a person to exist. By this means district officers are enabled to judge whether the scarcity is sufficiently severe to induce people to leave their homes in order by work to escape starvation. After this fact has been ascertained, steps should be taken for the establishment of relief works on a proper footing, under officers of the Public Works Department.

Mr. Norman.—The urban population in this district was not seriously affected during the last famine. The poorer classes of artizans, such as weavers, leather workers, &c., are those who first suffer, owing to a less demand for their wares, and to the general rise in prices. As far as my experience goes, they require no watching in the first stage. As soon as they are destitute they will present themselves for relief.

Mr. Hamilton.—In the town of Sangamner (population 9,000), the weavers were the people who seemed to be the first and most severely affected. All demand for country cloth ceased, and the weavers were forced ultimately to come on to relief works, our attempts to give them employment in their own line having failed.

Mr. Bosanquet.—The weavers, who lost their employment in the famine because the people more immediately affected by it had not money to buy clothes. These persons, when much pressed, would seek to obtain employment on relief works if possible, but as they are by their previous habits unfitted for such works, it is preferable to give them the means of carrying on their own employment.

Madras.

MADRAS.

Mr. Whiteside.—In the towns, the petty artisans, and more especially weavers, brass-workers, goldsmiths, washermen, and barbers are the first to suffer. Such people depend for their support in ordinary times upon the expenditure of the more wealthy in little luxuries which are the first things that are dropped when a famine makes its appearance.

Mr. Webster.—Artisans, weavers, daily labourers, and habitual beggars. Distress among such people is manifested by an increase of alms-begging and by their wandering about the streets.

Mr. Grose.—To the labourers and beggars, as the part of the population first affected by famine, must be added for towns where they are sometimes very numerous, the recipients of small ready-money pensions. The distress shows itself by outcries and disorders in the bazaar and not by wandering in this case. Relief works on subsistence wages should be provided near the town at an early stage.

Mr. Sewell.—In towns the habitual beggars feel the effects of famine first and manifest it by their increase of numbers, poorer appearance, and greater importunity. They are a most difficult class to deal with, being vagabonds and objecting most strongly to anything like the restraint and cleanliness of a camp. Without force it is next to impossible to keep them within bounds. What they like is to get a daily dole or meal and then to wander about in hopes of picking up more. If it were possible at the commencement of a famine to seize and confine in a camp all the professional beggars, it would be comparatively easy to assist the more deserving class of petty shopkeepers, hucksters, &c., who are the next to suffer. If legislation is to be adopted to give officers greater power of control, I think the professional beggar class is the one to which it should be first applied.

Mr. Price.—As soon as famine, as such, assumes a definite form, there is, in my experience, a tendency, and a very natural one, amongst the poor classes to get rid of the task of supporting useless relatives. The consequence was that the moment that the State or charitable private individuals step in, every infirm, old, crippled, or otherwise incapacitated person was turned off by his former supporters.

Mysore.

MYSORE.

Mr. Ricketts.—The same effects are observable in the urban population as in the rural, but naturally more intensified, as many ramifications of skill and industry which give employment to numerous individuals and classes are seriously interfered with in famine time. Those thus reduced to want may best be dealt with in the first stage by relief works near their respective towns, whilst a chosen few should be helped by advances in still pursuing their former avocations.

I. II. Qn. 4.

QUESTION 4.—PROPORTION OF POPULATION SUPPORTED BY PRIVATE CHARITY.

There is a considerable number of poor and infirm persons, who in ordinary years are supported by their richer relations and friends or caste fellows, and of habitual mendicants, but who become claimants of State relief when scarcity or famine arises. What is, approximately, the proportion of this class to the total population, and at what stage do the springs of private charity begin to dry up?

Punjab.—7 replies. Estimates vary. One gives 5 per cent. Springs of charity continue open as long as there are means to supply them.

North-Western Provinces.—An approximate estimate of 5 per cent. is offered. Charity dries up as prices rise, but the mendicants are cast off before the poor and infirm relatives.

Bengal.—Some estimates are offered, but differ so much that they are of no practical value. Springs of charity do not dry up if people continue able to give.

Bombay.—8 officers have answered the question. The highest estimate of the class is given at 5 per cent. of the population. Charity dries up as prices continue to rise and reach famine rates.

Madras.—16 European and 3 Native gentlemen have replied to this question.

The proportion of persons referred to in the question who are likely to claim State relief in time of famine is variously estimated at from less than 1 to 10 per cent. of the population. The unproductive classes, according to the last census returns, are 1·17 of the adult male population, but to this must be added, for the purpose in hand, a small proportion of those who, although mainly dependent on others in ordinary times, contribute in some degree towards their own maintenance, and infirm persons and helpless children. The approximate proportion is probably about 4 per cent. of the entire population.

PUNJAB.

Punjab.

Mr. Coldstream.—My opinion is that the proportion to the total population of poor and infirm persons who in ordinary years are supported by their friends, and of habitual mendicants, is not less than 5 per cent. All very old persons, all the blind and sickly, and nearly all the lame and leprous, come under this class.

The springs of private charity necessarily dry up quickly, because they are not deep; purses are not long, and when a real pinch comes, most of these persons are assuredly in a more or less precarious and dangerous position.

Mr. Roberts.—As far as dependent relatives and caste fellows are concerned, charity is co-extensive with the means of the givers; and as long as people have anything to subsist on, they generally, to their honour be it said, share it with their belongings; but habitual mendicants, that is blind, lame, and helpless people, but excluding religious beggars, feel the pressure of scarcity almost from the very beginning and become claimants for State relief. Many wealthy *baniáhs* and shopkeepers, it is true, continue to make daily distributions of grain, but the charity of these is quite insufficient to cope with the daily increase of pauperism. In the town of Rewári I estimate this class at about 3 or 4 per cent. of the population. In other places where relief has been organized I am unable to form any estimate owing to the large numbers of applicants who have come from native states and surrounding villages.

Mr. Nicholl.—In Amritsar the proportion of habitual mendicants, poor and infirm people, to the total population of the city is about 14 per cent.

The springs of private charity begin to dry up at the commencement of the second stage.

NORTH-WESTERN PROVINCES AND OUDH.

North-Western Provinces and Oudh.

Mr. Plowden, Meerut.—The number of habitual mendicants is known with some approach to accuracy in each large town; and in 17 towns in this division, in each of which the population exceeds 10,000, the per-centage of beggars, *i.e.*, begging families, including men, women, and children, on the total population, was at the last census 58 per 1,000.

The whole of these persons would certainly come on the public funds.

Mr. A. Colvin.—Proportions quite unknown. Springs of charity begin drying up at a very early stage, as the need of self-preservation has become apparent.

Mr. Sandys.—The proportion is approximately 5 per cent. of the population. The springs of private charity may be said to begin to dry up when prices are higher than 12 seers of the ordinary food grains for the rupee.

Mr. Whalley, Mainpuri.—I do not think there is any stage at which the springs of private charity dry up. The stream is contracted, of course, and unequal to the demands on it, but I have never known it run dry. There is a stage at which baniyas cease to distribute food gratis, and that is when they are frightened at the crowds which collect and think their shops in danger of being looted.

Mr. Kennedy.—Private charity begins to dry up in proportion as the continuance of high prices affects domestic economy. It has been gradually decreasing throughout the last year, but from August to October 1877 it was active, and only ceased with the opening of the district poorhouse to which the natives subscribed largely.

Mr. Leeds.—No reliable statistics are available. I should estimate approximately the proportion of this class to the total population at 5 per cent.

Captain Pitcher.—The proportion of poor, infirm, and mendicants living in ordinary times on private charity must be very large. In a city like Lucknow, for instance, where the beggars are estimated at 7,000 alone, I dare say that 25,000 would fairly represent the number who cannot ordinarily provide food for themselves by work of any sort.

Mr. Stoker.—Those supported by distant relations or strangers are early turned adrift, are, in fact, among the first to go. I have no grounds for calculating the number of these classes. It is a mere conjecture when I say that I do not think they exceed 2 or 2½ per cent. of total population.

Mr. Lumsden.—I do not feel in a position to venture an opinion as to the proportion the habitual mendicant and indigent classes bear to the total population. An approximately correct opinion on such a point could only be based on a census which distinguished these classes; and even were such a census taken, the data obtained would not be altogether reliable and trustworthy. I do not, however, think that the proportion of this class to the total population can exceed seven per mille.

Mr. Lawrence.—Amongst the rural population about 20 per cent. are supported by their friends. Nearly the whole of them, together with many of their supporters, come on the State for relief when famine arises. In towns the number of people supported by their friends is very much larger (I believe 50 per cent.), but only 10 per cent. of these latter will become applicants for State relief. In a famine year the whole of the habitual mendicants come on the State.

Regarding the stage at which the springs of private charity begin to dry up, the old saying is "*solah ser tak dharm bana rahta*," *i.e.*, as long as grain is not dearer than 16 seers to the rupee, piety (or natural affection towards one's relatives) holds out. But this refers to a time when 16 seers was considered very dear. In the present day, when grain falls below 12 seers, private charity begins to dry up.

But if Government pursues the same system of poor relief that it has adopted hitherto, it will be found, with every occurrence of scarcity, that private charity will dry up at earlier and still earlier stages.

Colonel Chamier.—Habitual mendicants are cast adrift very early in the days of famine, but poor and infirm relations are supported until State relief comes to the rescue, or until private funds are exhausted. Natives of India even, in a moderately thriving condition, are kind and generous to their poor relations. Their charity is bestowed with great discrimination; at the first glance it may seem to descend to stinginess, but the givers have gauged by experience what relief is sufficient.

H. II. Qn. 4.

BENGAL.

BENGAL.

Mr. Worsley.—It is impossible to say what may be the proportion of the class here mentioned to the total population. Roughly I should be inclined to estimate it at about 1 per cent. of the population, or in round numbers 20,000.

The springs of private charity in 1874 began to dry up when the Government introduced its liberal and comprehensive system of relief.

Mr. Magrath.—The proportion according to the census taken is 1 in 200 for all Bengal; but in Tirhoot the proportions were not 1 in 600. In Monghyr the proportion is said to be 1 in 500. They do not come on relief till the majority of the local population are compelled to restrict the food they cook to the smallest quantity they can live on. Up to that time the beggars getting the surplus have not to go about for relief; they get it from their regular clients.

Mr. Marindin.—About ·27 per cent. I found the estimate upon some inquiries lately made at Buxar. I think that, if left to themselves, people able to afford it will always give, and the springs of private charity never absolutely "dry up." What happens is that the numbers to be supported become so large as to overwhelm the efforts of the charitable public, and many must consequently go unrelieved. Then if Government steps in, the public stop giving, and send those whom they have hitherto managed to support to the Government poorhouses.

Mr. Metcalfe.—I should say that about 3 per cent. of the population, who in ordinary times are supported by the charity of their neighbours, become claimants of State relief when scarcity or famine arises.

Baboo Ramani Mohan Chaudhuri.—The proportion of the beggars to the total population here is approximately 4 or 5 to 100.

BOMBAY.

BOMBAY.

Mr. Hewlett.—In the Deccan, at the time of the Census in 1872, the total population being 7,966,061, the number of persons having no ostensible independent income, beggars, paupers, &c., was 128,945, or 1·6 per cent. of population.

Mr. Spry.—It is difficult to make any accurate calculation of the numbers of decrepits and poor supported ordinarily by relations and friends, and of habitual mendicants. I think 5 per cent. may be their approximate proportion to the whole population. The springs of private charity begin to dry up when there are no immediate prospects of amelioration in the situation.

Mr. Propert.—It has been calculated that about 5 per cent. of the total population live on the charity of their friends and relations, but I cannot say on what the calculation is based. In times of scarcity, mendicants, professional and casual, increase at an alarming rate, and in the case of large towns the regular beggars are quickly supplemented by arrivals from without. We cannot say that the springs of private charity ever entirely dry up; charity really continues throughout a season of famine, but the normal handful of grain given to each applicant in favourable seasons shrinks visibly in size in hard times.

Mr. Moore.—The poor and infirm persons and mendicants, who become claimants of State relief when scarcity or famine arises, are between 1 and 2 per cent. of the total population. The springs of private charity begin to dry up as soon as the food grains reach famine prices.

Mr. Robertson.—I cannot say approximately what the proportion of poor and infirm may be to the population. It is not very large, but I am glad to say that private charity is ever watchful and kind, and that it was only when the famine became protracted, and the pressure very severe, that private charity became exhausted.

Colonel Anderson.—Infirm persons, mendicants, and such like, will be deprived of private charity as soon as it is seen that public charity is ready to support them, nothwithstanding that their relations and caste fellows might be able to support them for some time to come.

MADRAS.

MADRAS.

Mr. Whiteside.—I am of opinion that about 1 per cent. of the population of a large town are habitual mendicants, and about 4 per cent. poor and infirm. Charity is regarded by the native community as the greatest of virtues, and its practice is maintained even to a scanty extent to a very advanced stage of a period of scarcity. Not until it is thoroughly borne in upon men's minds that the famine is really serious, and the importance of self-preservation is forced upon them by stress of circumstances, do the springs of private charity completely dry up. When lately the season began to mend, and fresh grain began to come into the markets, I noticed with surprise and pleasure as soon as prices fell how the practise of charity began to revive, and I saw beggars receiving small handfuls of grain here and there.

Mr. Horsfall.—The general opinion is that about 3 per cent. of the population are more or less dependent upon the support of their richer relatives or private charity. Private charity is very extensive; it is practised daily and without ostentation. It is difficult to prescribe an exact limit for the cessation of private charity: it is inculcated as a Divine obligation. Charity to poor and infirm relations does not cease until the means of self-support cease to the person hitherto protecting. The habitual mendicant does not hesitate to seek relief both by private and State charity. At no time can the springs of private charity be said to dry up except with the inability to bestow charity.

Mr. Martin.—Approximately, as far as I can ascertain, habitual mendicants are about 2·5 per thousand; deformed, blind, and other persons physically incapable of work are 3·5 per thousand; and old, infirm dependents of families 50 per thousand; total, 56 per thousand, or 5·6 per cent. Private charity begins to fail to a certain extent the moment people become aware that the failure in the harvest is universal.

Mr. Knox.—I should say that the number of those who from age or infirmity are unable to shift for themselves would be about 10 per cent. I do not include professional beggars, but I should not think that the number of these is large, and they need not be taken into account; they are mostly able to work and, like others, would be forced to apply for relief when distress became severe.

All the large numbers of infirm persons would not however be on our hands at the commencement of distress, but only the infirm of the labouring classes and poorer cultivators. This number, though amounting to 10 or 12 per cent. of the total numbers in these classes, would not be more than about 1 per cent. of the entire population. It would not be until famine

Ch. II. Qn.

Madras.

became so severe as to affect all classes composed of persons of only moderate means that the per-centage would much increase. It would require half the population to be on our works to make it rise to 5 per cent.

Seetharamiah.—The proportion of the class of people mentioned in this question to the total population may be approximately estimated at 6 per cent. This proportion is larger in the urban population, where the tendency and necessity to depend upon others, is greater than in village agricultural societies, who are all self-protective, except those completely unfit for work by physical unfitness. Private charity begins to dry up when the prevailing high prices begin to press the givers hard. The agricultural classes, many of whom after a fair crop followed by a total failure would have left for them surplus grain for about three months, will continue their usual charity till the greater portion of their own stock is exhausted. During the earlier stages of distress the usual charity is not discontinued all at once. The discontinuance is only gradual, and would not be felt to any perceptible extent till numbers seeking gratuitous aid become overwhelming, when alone arises the inclination to stop the usual charity altogether.

MYSORE.

Mysore.

Mr. Ricketts.—The proportion here referred to of poor and infirm persons dependent upon relations and friends, &c., and habitual mendicants, to the total population of this district may be roughly or generally given at 12 per cent., and at least half of them become claimants of State relief when famine arises. It is difficult to say at what stage the springs of private charity begin to dry up. Certain it is that such springs dry up gradually and under the pressure of a growing necessity.

QUESTION 5.—FORECAST OF CONDITION AND REQUIREMENTS OF DISTRICT.

Ch. II. Qn.

It is obvious that if an accurate forecast of the condition of the people during the approaching season, following any more or less serious failure of the ordinary harvest could be made by the district officer, it would be of great utility; in what way could he make it, and on what data should his calculations be based? Suppose for instance that he estimates that half the average food crop has been lost; for the support of how many people does the balance that is saved suffice? How are the rest of the people to be fed? He must form an estimate of the food stocks in the country and of the power of trade to bring in more. Supposing these two elements sufficient to supply what is wanted, there would be no famine of food. But there may be lack of money to purchase food; how is an estimate to be framed of the number of persons who would probably be able to purchase, and of the number who must be assisted by the State, either by employment which will bring them wages or by food if they cannot work? These would consist mainly of the classes indicated in questions 2, 3, 4, viz., the field labourers, the urban poor, and infirm dependents or mendicants. What numbers approximately of these classes would you expect to have on your hands if the food crops in your district failed to the extent of $\frac{1}{3}$, $\frac{1}{2}$, or $\frac{3}{4}$? and if this happened in two consecutive years.

Punjab.—3 answers are given. Some estimates are offered, but the replies rather illustrate the difficulty of making them than afford much light.

North-Western Provinces.—26 answers have been given. The possibility of making an accurate estimate of food stocks is doubted. Some conjectures as to the number of persons requiring relief are offered.

Bengal.—15 officers have answered. The majority think that the data for a useful forecast are wanting, and that this is especially the case in Bengal, on account of the absence of agricultural statistics. Estimates are given in particular cases by some officers, and also of the numbers who might come on relief.

Bombay.—10 answers have been given. The possibility of making a forecast of any practical value is doubted. So also an estimate of the numbers who may come on relief.

Madras.—14 European and 3 Native gentlemen have replied to this question.

This statement shows that where the land is held direct from Government there are available data for making a more or less accurate forecast of the condition of the people in a season following a failure of the ordinary harvest; but in zemindaries, owing to the cultivation returns not coming into the hands of the Government officers, such data are not available. Another disturbing element in making such a forecast is the improbability of estimating the extent of private stocks, regarding which the holders, whether dealers or agriculturists, maintain a jealous silence. As regards the proportion of the population likely to require assistance from the State if the food crops failed to the extent of $\frac{1}{3}$, $\frac{1}{2}$, and $\frac{3}{4}$, the evidence goes to show that one year's partial failure does not tell seriously upon the people, though a $\frac{3}{4}$ failure over a large area might bring about 7 per cent. of the population of the affected tract on to relief. If, however, the failure extends to the second year the estimate stands as follows:—

Second year.	Numbers requiring relief.
$\frac{1}{3}$ failure	7 per cent. of the population.
$\frac{1}{2}$ "	10 " " "
$\frac{3}{4}$ "	22 " " "

PUNJAB.

Punjab.

Muhammad Hayat Khan.—No doubt it would be meeting the danger half-way if an accurate forecast of the condition of the people during the approaching season following any more or less serious failure of the ordinary harvest is made by the district officer. To do this it would be necessary first to ascertain the amount of loss of the last food crop, and the distress prevailing in the country, the estimated produce of the present harvest, and the existing food stocks in the country, and the power of trade to bring in more, and then calculate how far the resources will suffice to meet the requirements of the district. In years of distress the assistant and extra-assistant commissioners should take a round in their sub-divisions, and personally ascertain the food stocks in the country, and the amount of produce of the present harvest. It is not possible to form an accurate estimate of the amount of grain that would likely be imported into the district. It all depends on the urgency and the amount of requirement of the district. The merchants as a rule take their grain to the market where it would likely obtain a ready sale, and fetch the largest amount of profit. Thus if grain be selling in the Gurdáspúr District at a very high price, the tide of commerce will turn to this district; but if, on the other hand, the demand for grain be urgent in other districts, it will take its course to those places, and instead of receiving any supply we shall lose what we already possess. A correct estimate of the out-turn of the kharif can easily be made in September, and that of *rabi* in March, nor would it be difficult to assess the grain stocks in the district. A correct account is kept by every *mahájan* of the grain stored by him, and on asking for the information it will be immediately obtained. But it will not be easy to form a conjecture what number of persons in the district, in the event of an outbreak of famine, would be able to purchase grain and what number not. It all depends upon the nature of the distress. If one-fourth of an average food crop is lost, no one, it is believed, would ask for help; the same may be said if even half is lost; but if ¾ is lost and for two successive years, then 1–10th of the population would be in need of health; but of this 9–10ths would earn their livelihood by working as labourers, and only 1–10th, that is one-hundredth part of the whole population would require gratuitous relief. If, however, the crop fails continuously for more than two years, the distress would indeed be very severe, and, excepting only the well-to-do class, the whole population will have to be fed.

Mr. Coldstream.—If in the same year both harvests failed to the extent of ⅓, I should expect to have on my hands about one per cent. of the population, or about 10,000 souls.

If in the same year both harvests failed to the extent of ½, I should expect to have on my hands 5 per cent. of the population, or nearly 50,000 souls.

If in the same year both harvests failed to the extent of ¾, I should expect to have on my hands nearly $\frac{1}{10}$ of the population, or about 90,000 souls.

This is a purely agricultural district, but it is very thickly populated.

A special inquiry into the food supply was made this year, and submitted to Commissioner with this Office, No. 290, dated 30th May last.

The result was that about ⅑ of the produce of the district is to spare for export or storage in a year of average crops, which proportion, however, is somewhat increased by imports of cheap grain from Trans-Sutlej. One-ninth produce is calculated to represent about 26,000 tons of grain. Perhaps on an average year about half of this is exported and half stored permanently in the district.

It was also discovered that the stores in the district were all but exhausted when the present spring harvest was gathered.

Mr. Benton.—The stocks in hand might theoretically be determined by actual inspection, or by collecting information regarding them; but in this country I despair of obtaining much satisfaction in this way. I suppose, therefore, that dependence must be chiefly placed on an exact knowledge of previous harvest, and on information as to the course of trades, together with a knowledge of the consumption of the people. This brings us back to preparation of correct returns of the out-turn of crops, which I have already discussed. If this were satisfactorily provided for it would dispose also of factor No. 2.

As regards the consumption of food this might be determined by actual inquiry in the locality, and the result should be verified by the import and export returns of municipalities. The decrease of consumption consequent on the rise of price would have to be duly taken into account. The 4th factor would be the most difficult to deal with satisfactorily of any, and I do not think that the district officer has at present the means at his disposal.

I would propose to deal with it in this way. Before a crop has reached maturity, when the out-turn can be accurately estimated, barring calamities, each district officer should submit a return of the out-turn of crops prepared with all possible accuracy, along with a statement of the existing stocks, and of the amount required for the consumption of the population until the next corresponding harvest, so as to show what surplus would be available for export, or what deficit required to be supplied. If the result were materially altered by calamities in harvesting a supplementary statement could be submitted showing the effect. These statements should be checked and compared by a central authority, and should then be published without any delay, together with a note by an expert, which would compare them all together and endeavour to determine what would be the prevailing prices at different dates throughout the year at all the ruling marts throughout the province.

Experience I consider to be the only safe guide in a matter like this, and judging by the light of it I should say that if the crops failed to the extent of half in two consecutive years the country would be impoverished, there would be great difficulty in realizing the revenue, but that distress would not be very apparent. My reason for saying this is that during the past year we had a failure of 2⅓ crops out of 4, and the largest number relieved on relief works was 2,419 in November last. If the *rabi* before the last had not been a partial failure I think no relief would have been called for. If, however, the crops failed to the extent of ¾ in two consecutive years we should have as nearly as possible towards the end of the period the state of affairs in the famine of 1869, when first two crops completely failed, then the third was scanty, and the fourth entirely failed. The maximum number receiving relief in any month was 12,120 relieved gratuitously, and 1,814 on relief works, out of a population for the distressed tract of 2,96,070, giving a per-centage of 4·7 instead of 12·5 as given by the Honorary Assistant. The distress ought to be somewhat less than this, as the only crop out of 4 was scanty or below average.

NORTH-WESTERN PROVINCES AND OUDH.

NORTH-WESTERN PROVINCES AND OUDH.

Mr. Plowden.—First of all, no accurate forecast can be made by a district officer of the condition of the people of his district during the season which will follow any more or less serious failure of the ordinary harvest; and for this reason he can only judge of the condition of his own district, and has but partial knowledge of the condition of other districts, it may be near or it may be far away from his own locality; yet the circumstances of these neighbouring or distant districts may exercise a great and unforeseen influence on the food supplies of his own district.

Take the case put in the question. We will suppose a district like Cawnpore, in which half of the average food crop has been lost, and we will suppose the collector is able to say with confidence, and with good reason for his confidence, that the balance saved will support his entire population for three months. Well he has to consider the food stocks in the country apart from his district, and the power of trade to bring in additional food stocks. Admitting for the sake of argument that he is able to tell or to estimate with an approach to accuracy what is the number of persons in his district who will have means to purchase during the next six or twelve months as the case may be, and of the number who must be assisted by the State, how could he say what would be the effect of scarcity in Poona and Sholapur in sending up prices or diminishing his existing stocks, or in decreasing the number of markets open to him for the supply of food stocks required by his district, and thus completely altering the conditions on which he makes his estimate of the extent to which he can procure food stocks from outside his own district, or the extent to which his own stocks will be depleted. Yet the demand at Poona and Sholapur last year did exercise a decided influence on markets so distant from these places as the markets in the Allahabad Division.

It seems to me that the most far seeing of district officers, the collector most acquainted with the circumstances of his people, can do no more than this. He can get some idea of the number of persons who earn a precarious subsistence, and have only a day-to-day means of life, and of those who are beggars. He can also form a fair estimate of the yield of the past harvest though this is more difficult. He may perhaps, but I think that is very doubtful, go even further than this and form a fairly trustworthy estimate of the food stocks available in his district. There are so many contingencies, so many accidents, that may exert a sensible influence on the supply in his own markets, on the stocks in markets to which he might resort in case of want, and on the purchasing power of the rupee, that I do not see how, with his means of information, he can go further than this.

Anyone who has studied with care the history of prices and the evidence taken by the committees, Lords and Commons, so far back as 1833 on agricultural distress, will understand what great difficulties have to be overcome in making any accurate forecast of this nature, even in a country with extended facilities for acquiring information and for publicity like England. How much greater must be those difficulties in a country like this, where neither the sources of information are so readily accessible nor is publicity so prevalent. Who is there, in fact, who can honestly say he can really form a trustworthy estimate of food stocks in this country for any single district? I am certain that in every instance in late years where the attempt has been made to obtain an accurate estimate of food stocks either in a particular district or in a particular province it has been attended with conspicuous failure.

Look at the conflicting opinion as to the weight of an average harvest per acre in different parts of the country, or in the same district, where the estimate is made by several persons, and we can then form an opinion as to the difficulty of getting a really accurate estimate of the food stocks of the country or of any part of it.

Mr. Colvin.—Every man will do this his own way. It is useless to attempt any general answer to such a question. The data for much of such an estimate are obvious; for much again there are absolutely no reliable data, *e.g.*, the class who will claim relief, for this depends on the extent and endurance of the famine. The reply to the last paragraph cannot be given unless I am told how the food crop stood in adjoining districts or in remoter sources of supply.

Mr. Sandys.—I have no data on which to base any calculation as to the number of persons who must be assisted by the State, if a certain proportion of the crops failed and there was no food famine. Such conditions have not occurred in this district. Heretofore, when there has been such a failure in this district it has extended over so large an area of these provinces that a famine of food has followed as a necessary consequence. Up to the present time such records as exist of previous famines show that in this district complete failure of the crops has not extended to more than one out of the two harvests in the year, and that scarcity has arisen in consequence of the partial failure of the crops in two consecutive harvests.

In 1860–61 the out-turn of the autumn harvest was under half of an average year, and spring crops failed altogether. The number of persons said to have been relieved was 479,926.

In 1868–69 about a half harvest was gathered both in the autumn and in the spring, and the total number of persons relieved was 707,287.

In 1877–78 there was a complete failure of the autumn harvest and a good spring harvest. The average daily number of persons on the relief works from the time they were first started in August 1877, until they were closed in March 1878, was 2,220 (these may be classed as field labourers), and in June and July 1878 4,274; and the average daily number in the poor-house between 17th September and 16th October 1877, and 17th December 1877 to 7th April 1878, was 647 (these may be classed as the urban poor, infirm dependants, and mendicants); and in the relief camps in June and July 1878 the number was 2,017, and the daily death rate from 1st October to 30th June was 116 in excess of the rate for the same period of the previous year. These may also be put in the same class as the poorhouse population. Adding together the totals of the daily numbers on the relief works and in the poorhouse and of the excess death rate gives a gross total of 9,274, and this is approximately the number the Government would, in my opinion, have to provide for during eight months, in case of the complete failure of one crop or of one half the crops in two seasons following a harvest much below the average. If the previous harvest had been a fairly good one, no distress would I think be felt if the yield of the next kharif crop were only half as much as in an ordinary year; but if this shortness were to be succeeded by only half the usual out-turn of the rabi, then I estimate that the State would have to support 4,637 persons for three months or longer, if the prospects of the ensuing harvest were not favourable. A failure of only one-third of the crop in both harvests would not, I think, require any special measures of relief to be taken if the out-turn of the former year had been an average one. I have taken into consideration the excess mortality in the months of April, May, June, and July 1878, as well as the numbers on the relief works and camps reopened in the months of June and July, as they may be ascribed to the failure of the kharif crop.

Mr. Tracy.—The answer to the question for how many people would half the average food crop suffice must vary with the circumstances of each district. In a grain exporting district half the average crop might be enough, or more than enough, for the whole population. I am not aware of any method by which it is possible to form an estimate, as distinguished from a mere guess, of the number of persons who must be supported by the State in the event of famine. All that can safely be said on this subject appears to me to be that the collector of a district containing a large population of non-agricultural castes, such as *chamárs*, *júláhás*, and the like, who, even in seasons of plenty, breed up to the verge of the starvation, must expect that large numbers of them will come on his hands in times of distress. In districts bordering on native states he must also be prepared to provide for crowds of immigrants.

Mr. Kennedy.—This district can never suffer from an absolute lack of food, as it is penetrated by the railway, and carries on a considerable commerce with all the chief centres of trade, but in estimating the local food resources of the country two facts would have to be taken into consideration, namely, the amount of land under food crops, and secondly, the amount of grain in store. It is easy to make a rough estimate of the first. All the land under cultivation in a year of famine may be assumed to be under food grain, at least that was the actual case in this district in 1877. The amount of land under cultivation can be approximately ascertained, through the ordinary revenue agency, at the very beginning of the famine, and, as it will all be irrigated, we can assume the

I. II. QN. 5.

NORTH-WESTERN PROVINCES AND OUDH.

average district out-turn and obtain a sufficiently close approximation. The second element, however, namely, the amount of grain in store, could only be estimated after a long course of traffic registration.

It is possible, however, to form on general grounds a sufficiently close guess. I shall give as an illustration the calculations made for the district last year.

It was assumed that the agricultural community always retained sufficient food to support itself from one harvest to another, or say for six months. Three of these months had gone when the failure of the monsoon become decided. It was assumed therefore that there must be at least three months grain in the country.

From the registers of town exports and from the railway returns it was evident that a very much larger amount of grain than usual had been exported. This export trade was much larger than any that had previously occurred, and it was known that the town stocks were reduced as low as possible. It was therefore inferred that there could not be any large balance of grain in store throughout the country beyond the three months supply which I have already mentioned. This estimate was confirmed by consultation with landholders, grain dealers, revenue officials, and others. I now come to the verification.

I estimated in para. 3, chapter I., the maximum consumption of the district at something less than 5,500,000 maunds of grain. In a year of scarcity this will be diminished, let us say, to 5,000,000 maunds. Of this the town population will consume 800,000 maunds per head. The town population was supported entirely by imported grain, and may be left out of the calcul tion; the country population will thus consume in a year of scarcity 4,200,000 maunds per annum, and we have to calculate what stores they possessed in August 1877 for eight months till the arrival of the rabi. The consumption of these eight months will be 280,000 maunds; 82,000 acres of food grain multiplied by 11½ maunds per acre give 946,000 maunds. 175,000 maunds were exported to the district from the towns. Add supposed food stock for three months 1,050,000 maunds, and we have a total of 2,171,000 maunds, or 600,000 maunds less than the country must really have possessed, *i.e.*, the country had really four and a half months supply instead of three months supply as was supposed. At the end of March the district was largely importing food from the towns, and the grain stocks were almost wholly exhausted. We may therefore safely say that at the commencement of the monsoon this district has never had less than five months stock in hand, even in times of excessive exports. It would of course be possible to keep up a yearly calculation of these grain stocks, commencing with the figures which we have thus ascertained. But it will probably be of little value. We know, as I have showed, the minimum in one exceptional year. There is no means of ascertaining the maximum, but as the amount produced by the district exceeds its maximum consumption only by two or three lakhs of maunds, and when grain is not exported, the total maximum of food stock is probably never equivalent to more than ten months' consumption, the initial grain stock may always be assumed to be between these two estimates.

I now proceed to the second part of the question, and first I shall calculate the numbers of the classes enumerated in paras. 2, 3, and 14.

1st.—The total number of male labourers above 15 is 25,954, multiplying by 4 we have 100,000 in round figures, or the total of the labouring class inclusive of their families.

2nd.—The petty mechanics and traders entirely dependent upon the agricultural community may be estimated at 60,000. All of them are a little above the level of day labourers.

3rd.—Mendicants 10,000.

We have now to add the number of cultivators unable to bear the distress. Judging by the statistics of a large estate in the worst part of the district, I estimate that six-tenths of the cultivators could weather the year without being reduced to poverty; three-tenths more require assistance to continue their cultivation, one-tenth has died or fled. This last tenth therefore must be included in the estimate. One tenth of the agricultural class would amount to 60,000, the total number therefore requiring support is 210,000 in a year of complete failure. If a second year of failure supervened these numbers would be increased by 100,000 cultivators whom we have supposed to be on the verge of destitution. The total population of the district is 950,000, the proportion of the destitute to the whole would be 25 per cent. in the first case and 41 per cent. in the second.

Mr. Cornwall.—The proportion of field labourers thrown out of employ I should calculate at a rate somewhat in excess of the proportion of the crop failing. If one-third, one-half, or three-fourths of the crop failed I should expect to see three-eights, five-eighths, or seven-eighths of the field labourers lose their work, and if the same happened a second year the number would probably still further increase. Every working tenant would with the help of his family do as much as he could himself and prune all extra expenditure, and in the second year of distress he would redouble his efforts. Wealthy *zemindars* would be the only persons able to afford field labour, and they would probably have so much land thrown on their hands that they would be obliged to maintain a certain number of labourers; but in villages where the zemindars are poor the whole of the labourers might be expected to require State assistance.

Mr. A. Mc Webster.—I do not believe that an "accurate forecast" of the condition of the people during the approaching season following any more or less serious failure of the ordinary harvest is possible. The persons who, from the nature of their employment, the opportunities they enjoy of collecting facts bearing on the question of food supply (which is of course what regulates the condition of the people), and the large personal interest concerned, would naturally be those most likely to form an accurate forecast; but the great grain dealers themselves are often at fault, even when they have to look to market prices of a few weeks in advance for their profits, and have not to take into consideration the extremely disturbing factor of the probable out-turn of a harvest. I know of several instances in which grain dealers of large experience suffered heavy losses last autumn at Agra from a miscalculation of the food grain supply in the country. They made large purchases for a rise in prices, and in ten days afterwards a fall occurred, which continued. If men who have made grain-dealing their lifelong business, and who may be said to have inherited an aptitude for the trade, are liable to such errors in merely estimating the probable amount of the available stock of grain in the country at a given time, how is it to be expected that district officers can make an "accurate forecast" of what the condition of the people is likely to be during an approaching season? The idea is chimerical. Take the case of the rabi harvest of 1878. I venture to say that any district officer called on at the beginning of February in that year to forecast the prospects of his district during the "approaching season" would have based his calculation upon the expectation of a "bumper harvest," whereas the out-turn of the crop was not less than 50 per cent. below that of an average year. I do not think, however, that the impossibility of forming an accurate forecast of the condition of the people need prevent due and proper preparation for a famine. The district officer would naturally take into consideration the amount of the ordinary importation into his district of grain and the exportation from thence, and he might form some sort of approximate notion as to how his district was likely to be affected thereby, but this would be for the most part guesswork. I find it impossible to give definite answers to any of the clauses of this question, for it treats of a subject on which no definite knowledge is to be procured. I

Ch. II. Qn. 5.

North-Western Provinces and Oudh.

should not say that a failure of one-third or even half of a crop would necessarily throw any portion of the population on the hands of the State for relief in all cases, though perhaps a failure of two-thirds of a crop might do so.

All would depend on the circumstances of the district in which the failure occurred. For instance, a district might usually grow so much grain in excess of the wants of its population as to be able to export largely in ordinary years; in case of a failure of the crop the rise in prices would check exportation, and there might still be sufficient food for the people even with a loss of one-third or half of the ordinary crop.

Mr. Spedding.—There are so many elements of uncertainty that any forecast of the future can only be vague and liable to be shown erroneous, while the slightest change may alter the conditions in the widest degree.

There are two points regarding which an estimate has to be made—(1), is the supply of food likely to be insufficient in itself to support the population; and (2), if not, to what extent may incapacity to purchase necessitate relief?

The first point, inasmuch as it presents certain fixed basis, may perhaps be decided sufficiently for an answer in the negative or affirmative. The gross food produce may be calculated from cultivation and out-turn statistics with some success. The minimum supply of food necessary to support the known population can also be calculated. The probable loss from bad seasons would I think be best calculated on each separate kind of crop, for the rainfall may be quite sufficient to give a good out-turn of one crop, while another dies from want of moisture. Of course, any such calculation is liable to be falsified by a fall of rain or partial rains affecting one part of the district more than the others, and will render such calculations more difficult. By deducting the probable loss from the average out-turn, a probable out-turn is arrived at, and it will be seen whether this is sufficient to support the population at minimum rates. The more difficult question of export or import and of previous stores then arises. The first must depend a good deal on the circumstances of the surrounding districts, whether more or less affected by scarcity and the means of communication. Municipal returns and the price of grain may enable some idea of the latter to be formed. In this manner I think it is possible to forecast the question "will there be a food famine or not?" so as to answer in the affirmative or negative with a fair chance of success, even though no very reliable figures may be obtained.

The second point it seems almost impossible to foretell. The total numbers of such people as belong to the classes which usually come on relief works and poorhouses may be roughly deduced from the census papers. But as a given supply of food is not applied to support only that proportion of the population which it can support, but is spread over all, each person decreasing his expenses in various ways; as prices depend not only on the supply and demand, but also on the prospects of the season; as the circumstances and buying power of individuals vary largely, it seems impossible to frame any estimate in figures.

Further, numbers of people able to maintain themselves will prefer to save what they possess when by doing a slight day's work they can obtain a larger meal than usual. In short, actual previous experience would seem to offer the only means of coming to any conclusion.

In this district it seems that there have not within the present century been any food famines, and it would need an excessively abnormal rainfall to cause one.

Taking roughly the Government rates for a bare subsistence of 4 *chittacks* flour for children under 10, 8 *chittacks* for women above 10, and 10 *chittacks* for males above 10. Although this is probably considerably higher than the rates on which many people live, and is certainly not below the mark, we get the following amount of food necessary for the population of this district:—

Children under 10, 596,457 at 4 chittacks per diem or 2½ maunds per annum - - - - -	1,491,142
Women above 10, 673,142 at 8 chittacks per diem or 4½ maunds per annum - - - -	2,929,139
Males above 10, 749,751, at 10 chittacks per diem or 5½ maunds per annum - - - - -	4,123,630
	8,543,911

or about 4½ maunds per head per annum. This agrees very closely with the municipal returns in ordinary years, and as it merely considers grain, and not the quantity consumed of fruits, on which many of the poorer of the population live chiefly for several months in the year, or fish, vegetables, herbs, &c., the estimate is probably well over the mark. In the answer to question 3, chapter I., I estimate the out-turn of food grains at 20,772,000 maunds. In round numbers, then, the population can be supported by 8,000,000 maunds, and an average out-turn will be 20,000,000 maunds. Thus estimating previous stores, export and import, three-fifths of the food out-turn may be lost and still leave sufficient food to supply the population. In addition to this there is a large import of rice from Nepal. This is, however, always liable to be stopped by action of the Nepal Government, and is mostly re-exported in ordinary years.

Colonel Fisher.—In a sparsely populated and poorly cultivated district like Garhwál, there is, as a rule, very little surplus production, and hence no export of grain. If, therefore, I estimated that half the average food crop had been lost I would conclude that the people had only three months stock of food to last them for six months, and the condition of affairs would be very critical. Experience tells me it is unsafe to count on reserve food stocks. As a proof of this I would mention that the people who purchased grain from Government stores in January and February last, and repaid it in kind last June, wish to repurchase from me now in July, to enable them to carry on till the kharif is harvested, and this in spite of an exceptionally good rabi of wheat and barley last May. Instead, therefore, of calculating how many people would be fed by any balance of food in hand, I would consider it necessary to provide food for everybody, in the suppositious case above given, for at least four months. The power of trade to pour in grain at short notices in a district of 5,500 square miles covered with villages far removed from each other and inaccessible to pack animals would be extremely limited. I could only arrange for storage along main lines of road. In a country where the entire population is agricultural, money would always be procurable by the man who had a crop in the ground ripening for harvest; but of course by the field labourers, the urban poor and infirm dependents, or mendicants, money would, unless the State provided labour for those fit to work, be absolutely unprocurable. In the hills, though these classes represent but a small fraction of the entire population—certainly not more than 5 per cent., and need not cause much anxiety as to their many wants—if the food crops failed to the extent of one-third, I would expect to have on my hands about 5,400 people of this class; if half the crop failed, about 8,000; and if three-quarters failed, about 12,000. The harvest failing for two consecutive years, which is an event unknown in the history of Garhwál, would probably raise the total of these classes on my hands to about 16,000, for this figure represents all these are.

Colonel Reid.—Half the average food crop of the districts of this division would suffice for the support of the people, so far, at least, as to prevent their suffering seriously, supposing that there was no export.

CH. II. QN. 5.

NORTH-WESTERN PROVINCES AND OUDH.

It is of course known that natives in all seasons use mangoes and mahua largely as food, and in seasons of distress roots, berries, and herbs of sorts are extensively used to eke out the small ration of grain. I believe past experience has shown that the danger of a food famine all over the empire is extremely slight; that, taking the empire as a whole, a supply of food sufficient to feed the people has always been forthcoming; and it may be assumed that when, in any district with railroads and fair internal communicacations, there is an effective demand, *i.e.*, a desire to purchase combined with the means of paying for purchases, the quantity of grain required will find its way into that district.

The difficulty will, I think, always be the lack of money to purchase food.

J. J. F. Lumsden, Rae Bareli.—I know of no better means of estimating the number of such people than by basing our calculation on the ascertained results and experience of past famines. The number receiving State relief has always varied much in different districts in a famine-stricken tract; the degree of pressure, the class of the inhabitants, and the system adopted on relief works and in poorhouses will all affect numbers seeking State relief in different districts. In answer, however, to the direct question put in the concluding sentence of the question, I may say, that with a failure of 5 annas 4 pie in the rupee in one harvest, I should not consider special relief necessary at all. An 8 annas failure would probably bring 3 to 4 per cent. of the population, and a 12 annas failure 6 to 8 per cent., on the hands of Government for relief either on public works or in poorhouses; and if a similar failure took place in two consecutive years, I believe the numbers requiring assistance would in each case be from double to treble what they were during the first year.

Mr. Harington.—As to famine of food, the power of trade to bring in food is a far more reliable basis of calculation than that of the food stock in the district. It is only as a unit going to swell the general stock of the country that district stock is of much use as a basis of calculation. It is most difficult to get at what this stock is. Every effort is made to conceal the stocks in hand and to mislead inquirers. The actual out-turn being calculated, the amount exported is at present an unknown quantity. In this district the problem almost confines itself to the means of getting the people money to purchase food. This done, the trade will, in any set of circumstances at all likely to arise, do the rest. There is not likely to be a food famine so long as there is money to buy it. But increasing exports will inevitably cause a general rise of prices; great quantities of grain formerly available for local consumption will leave the district; and until a corresponding rise in wages takes place the labouring population may be subjected to both food and labour famine. A labour famine will occur in every year of scarcity. Its extent can scarcely be predicted on present data. *A two years consecutive failure of both the kharif and rabi* crops to the extent of three-fourths, or even of half, might be expected to bring half, three-fourths, or indeed the *whole* population of field labourers, urban poor, and infirm dependents and mendicants on the hands of the State. Such failure is practically out of the question; could it occur, not 600,000 out of the 1,000,000 of this district would escape without assistance; not one of the classes named. As a fact, a bad *kharif* is likely to be followed by a fair *rabi*; in which case a failure of one-third is not likely to bring 15,000 on the hands of the State.

Half might bring some	-	20,000
Of two-thirds	- -	50,000

These numbers would be at least doubled if a second failure of the kharif followed. A failure of the intermediate *rabi* might be expected to include the whole of the classes named, and most of the poorer agriculturists besides. The total numbers seeking relief would then probably not be less than from 500,000 to 750,000.

Mr. Quinn.—I place little reliance on figures professing to give the food stocks in a district. I do not believe that an estimate, even approximately accurate, can be made, and calculations as to the length and severity of distress based on such data are sure to prove most delusive. The data which can be ascertained with considerable accuracy, and from which sufficiently accurate conclusions can be drawn, are the amount of food crop lost, that is to say, the actual out-turn as compared with the average out-turn; the class and proportion of the population, who live wholly or in part on these food grains; whether they live on them during the whole year, or only during certain months; whether, failing these food grains, other cheap food is procurable; whether the district ordinarily produces more or less of these food grains than it consumes; whether this export or import will probably continue; whether the preceding years have been bad or good ones; what is the prospect of the ensuing season; what is the normal condition of the people. To ascertain the amount of grain held in stock by cultivators and dealers is quite as impossible as to ascertain their profits. Everyone tries to mislead, the authorities. The attempt is likly to create a panic, and those conducting the inquiry find ample opportunity for extortion. Supposing, however, that a fairly accurate return has been obtained it may be soon rendered useless by unforeseen circumstances. Where a district is well supplied with communications, especially railway communications, export and import are affected by the prices ruling in distant grain depôts. Last year Oudh export fluctuated with prices at Benares, Calcutta, and Bombay. The stock may also be largely reduced by grain withdrawn for seed. Last year our return of food stocks had only just been completed when an abundant rain fell, the result being that instead of *rabi* being sown in only about one-third of the ordinary area the area actually sown was fully half more than usual. Our stock return then, whatever its previous value, became utterly useless, unless supplemented with an estimate of the amount of food grain withdrawn as seed.

The measures I adopted were to open poorhouses at each of the tahsíli towns. This secured the supervision of a tahsíldar and hospital assistant. Municipal works sanctioned in the budget were taken in hand, and additional works projected; the district engineer was instructed as a tentative measure to take on at a low wage all who applied for employment on a few selected district works. When it was found that people flocked to these works, notwithstanding the low wage, and that many came from a distance, a few regular relief works were opened. This system of only extending relief works as the necessity for them was proved worked well. The class who apply for work, their physical condition, the proportion to the whole borne by men, women, and children, and the distance the applicants have come from, require to be all carefully watched. As long as it is possible, I prefer that the people should be given work within a reasonable distance of their homes, and have at least the option of returning to them at night. When famine increases in severity large works must be set on foot, and this requires the assemblage of workmen in large bodies. To these works I should draft off the able-bodied men and women, under the inducement of a higher wage, leaving the weak and infirm, and those encumbered with families to be employed on petty works near their homes; but as regards an absolute rule that all relief labourers are to be employed in large bodies and to be hutted, it should be borne in mind that huts are built for those who leave homes of their own; that the sick, the old, the infirm, and young children, have all to be dragged to long distances from their homes, or else a special and expensive village organization has to be made for their maintenance and attendance, during the absence of their natural sup-

Ch. II. Qn. 5.

North-Western Provinces and Oudh.

porters, and that camps if epidemics are to be guarded against require special sanitary arrangements and medical supervision. I do not think it would be wise to incur all this expense, and to put the people to so much hardship, simply to secure a test that those relieved were really in want. The special works to be opened should be selected by the district officer in consultation with the district engineer. All relief works should be under the Public Works Department, and the head of the district should be generally responsible.

BENGAL.

Bengal.

Mr. Barlow.—In the province of Behar we are absolutely without the data necessary for making an accurate forecast regarding the food supply. All the districts are permanently settled, and we are deprived of the information obtained under the tahsildari system of the North-Western Provinces, or the ryotwari system of Madras. Our general survey, which is 30 years old, supplied in certain cases only the total amount of land cultivated and culturable, as distinguished from waste, and without detail regarding crops. We know nothing about the advance made in cultivation, nor can we say how the land is distributed under the different kinds of crops, and what is the amount of produce. It is truth, therefore, to say that the "average food crop" here is an unknown quantity.

It seems to me that little is to be gained by guessing at the proportion of the population likely to come upon the hands of Government under given conditions in regard to the failure of crops. The only kind of information that would furnish a fair basis for a calculation in this direction would be the details as to castes, general circumstances, and numbers of persons who, during previous famines, have accepted relief in food and money. These, again, should be compared with well ascertained particulars respecting the extent of crop failure and the course of the distress that followed it.

According to the system upon which we worked in 1873–74, inquiries with a view to action to avoid famine were made early, and before the physical condition of the people would be likely to show much effect from the failure of the food supply. The declared policy of Government that famine is to be met and relief undertaken before the population is brought into a generally reduced condition will, in the view I have taken, tend rather to confirm the position that in making a forecast for an anticipated season of distress, we base our judgment upon the fact of failure of the food crop, and conclusions drawn therefrom, and not upon any ascertained facts with regard to the state of the people themselves. I do not say that this can be easily avoided; but it tends to increase the chance of mistakes being made, and may help to account for them when they are made. Under the system of what I may call working downwards to distress, the district officer has ample and quick notice of apprehended misfortune. Personal communications with, or reports from, police officers and others tell him that the crops have failed, and the poor must suffer, almost before it has been decided that, according to the rain-fall, the season has been irregular. I may mention that, during the last few years, the annual outcry that the season has been abnormal and is likely to prove disastrous has become a regular habit. These warnings are listened to with more or less attention, as the general appearance of things is felt to be threatening; and the information obtained is tested as far as possible by the personal observation of the district officer and his subordinates, who, if necessary, take care to examine the state of the crops before they are taken off the ground. Government having undertaken to protect the people from famine, there can be now but little chance of any reasonable alarm escaping the notice of the district officer. Real difficulty commences when the district officer, having finally resolved that distress is coming, proceeds to determine the precise character of the same and the action that must be taken, and to this end attempts to guess at the number of people likely to require relief upon the basis of the proportion of crops lost. I wish that a method could be devised whereby the ascertained condition of the people and the number likely, according to their habit of life, to become pauperized, even if this be worked out for limited tracts only, might form a clearer element in the calculation.

A district officer would, I suppose, judge whether distress is due to temporary or local scarcity, or likely to be the forerunner, of very general severe distress ending in famine, by observing the extent of failure of crops and the range of prices in his own district and elsewhere. He would also consider whether the last year or two had been years of plenty or otherwise, the state of stocks, trade, &c. As regards the state of crops and prices, I think that existing means are sufficient for keeping officers informed of what is going on; what with weekly notifications in the "Gazette," newspaper reports, and communications (personal) between officers, and, lastly, the action of Government itself early in the season, when times become very threatening. The state of stocks and trade under the Bengal system is a knowledge to which the district officer cannot obtain. Government are collecting statistics of river trade at registering stations, and they receive the railway traffic returns. These may be conveniently supplied to local officers as soon as a means has been devised whereby they may know something about the produce of their districts, but not beforehand.

Colonel Burn.—Generally speaking, half a food crop will about suffice to feed the population where food crops predominate, and where other grain exceeds food grain, the price of it will have about the same effect, on importations, if food grain can be imported. I do not consider any State relief would be necessary if only one-third of food crops failed; if half failed, half the field labourers and urban population would require some help; if three-fourths of crop failed, three-fourths of field labourers and urban population and all infirm mendicants.

Mr. Worsley.—My belief is that all famines in Behar are occasioned by drought, and that the only classes of the people which should be extensively relieved or assisted by the Government are the agriculturists and field labourers. In making a forecast of the condition of the people during an approaching season of scarcity or famine, I should ascertain by a village to village inquiry what proportion of the crops had failed in each village. I should consider the quality of the three previous harvests and the probabilities of reserve stocks being larger or smaller than they would ordinarily be supposed to be at the particular season of the year. I should assume an average out-turn of grain per beegha for ordinary years, and calculate the probable out-turn in maunds of the harvest that had failed and the probable out-turn of the next following harvest. Adding these quantities to the reserve stock, I should calculate what proportion of the whole population the total stores would maintain until the reaping of the *bhadoi* harvest at an average daily rate of three-fourths seer per head of the population. If there appeared likely to be a considerable deficiency of food, and there were little prospects of prices being kept low by importations, I should recommend that *provisional* arrangements be made for relieving (for the ascertained

H. II. Qn. 5.
Bengal.

period), by a joint system of advances and relief works, that proportion of the population for whose support local supplies would not suffice. The majority of the queries contained in question 5 cannot be answered from my own actual experience, and I think it well to express my opinion that conjectural estimates are simply useless. In 1874, Seetamurhee sub-division suffered famine from failures of harvests scarcely more extensive than the failures which occurred in 1875–76. In the latter year, owing to large importations of food (some 15 lakhs of maunds being imported to the district), very low prices and an excellent mango season, the people of Seetamurhee sub-division managed to support themselves without any assistance from the Government. In 1875–76 the out-turns of the three harvests in that sub-division were *bhadoi* 8 annas, *aghani* 5 annas, and *rabi* 8 annas. The out-turn of the *aghani* harvest was ascertained by a village to village inquiry made by selected native officers and by myself. On 15th December 1875, I estimated that 152,300 persons of the agricultural and labouring classes would require assistance for three or four months in 1876, and that 5,000 paupers would require charitable relief; but, as I have already stated, a combination of favourable circumstances subsequently upset all my calculations. Last winter the rice crop (the principal harvest in Seetamurhee sub-division) failed in the sub-division to the extent of nearly two-thirds, and was followed by a 10-anna rabi crop, but importations and an unusually fine mango season have again enabled the people to subsist on their own resources. Considerable privations have been undergone no doubt, bnt still no instances of starvation have occurred. I presume that so long as failures of crops are not very extensive or general, and there is no fear of a general famine, the borrowing powers and credit of the lower classes will stand them instead. The peasantry, however, from the accumulated pressure of debts, and from their want of tenant rights, must always remain under the existing state of the rent law in a very low condition.

Mr. Magrath.—No accurate forecast can be made, nor, supposing the crop be estimated correctly, which it cannot be till just before it is cut (hail, blight, insects, and floods being all possibly destructive influences), the extent to which exportation may take place is a factor which the district officer has no means of calculating. This he cannot tell until he knows what the people into whose hands the grain has fallen will do with it: they may export a great part of it, trusting to buy cheaper hereafter; they may have to part with it to mahajans who will hoard it for a rise or send it elsewhere; they may have to advance it to their labourers to keep them going till next crop. This, if there is a prospect of the next crop being good, is what they probably will do. Nothing but the roughest calculation can be made, and the holders of the grain can upset that calculation at any moment by the course they happen to take.

It entirely depends on the capabilities of the country. If it is a rich country where stores are kept, it will be sufficient to give work and wages for that work to the poor and trust to traders to import. If the country though poor has large dealers, Government by giving traders advances and starting work for the poor could supply the want; but if as in Madhubanni there were no traders, Government must import and sell as well as pay wages. The estimate of stocks is always very difficult, nay, anything like an accurate estimate is impossible. The very vaguest estimate only can be made. The power of the trade to bring in more is always easily estimated. If you have big traders in a large way they can always, if furnished with money at low interest, provide any quantity of grain if given sufficient time. The estimate of the number of persons who will come on the State for relief can be roughly estimated from the census list of castes (the tables of occupation are nearly if not entirely useless). Anyone acquainted with the district would be able to pick out the poor castes, and those who mainly form the classes of labourers without land or other means, and the artizans who will be without means, and according to the apparent severity of distress how large a proportion of mendicants will come to the State. In no case will they all come; a proportion even in the worst times being supported by the rich. Thus in Madhubanni I calculated that about two-thirds of the population would be eventually on relief, and that it would not be safe to calculate for less than an average of half the population during the months which must elapse before a fresh crop would come in. As a matter of fact the numbers on relief rose out of a population of less than 700,000 to more than 500,000, and from March to July, when advances were made to enable the fields to be cultivated, the numbers never fell to 200,000.

The estimate should always allow a margin, as was clearly shown by the fact that in 1874 three days delay in the fall of the rain would have ruined the rice, maruá, and janerá crops, and prolonged the famines till January or February. If one-fourth of the crop remained in any district that I have yet visited it would suffice to support the people though on scarcity rations; provided there were no exportation, I should expect to see 20 per cent. of the number of labourers and poor artizans and the same number of the beggars on State relief but not more. Of course, if as was the case in Madhubanni a large portion of the small crop was sold elsewhere, the conditions would be entirely changed. If this continued for a second year, the whole of the urban and rural labourers would be on relief, as the farmers would not have the grain to pay their labourers with, and the bulk of the beggars would also come on relief.

Mr. Hodgkinson.—It is impossible in a report of this kind to enter at length into all the contingencies which may arise. I will, therefore, confine myself to those which depend upon the condition and circumstances of the district crops only. If the bhadoi is a good crop and the rice fails, there will not be general, but somewhat severe local distress in rice tracts during December, January, and February, until the rabi crops are reaped, and perhaps also in May and June. If the bhadoi is an average crop, and the rice half an average crop, I do not look for any remarkable distress, provided the rabi crop is a good one. If the bhadoi is only three-fourths of an average crop and the rice crop a fair one, there will similarly be no scarcity, though in places there will be pressure in October and November. If the bhadoi is half an average crop, only relief works will have to be specially started in October and November to continue until the rabi is cut, if the rabi harvest is a good one. If the rabi harvest is also a bad one, one-tenth of the population will be on our hands in April, May, and June. With less than half an average yield of bhadoi, unless the promise of the rice is very good, we shall approach a famine very nearly in October and November. The rabi crops will have to be very good indeed to prevent a far worse state of things than occurred in 1874.

Mr. Toynbee.—This seems to me the most important of all the questions in the series, and to involve, if it could be answered fully, the solution of every difficulty, except the financial. For the purposes of an *accurate* forecast it is clear that such figures as are used as the basis for such a forecast *must* themselves be accurate, and quite beyond the range of guess work and doubt. A district officer to make such a forecast,—(1) should *know, not* guess, the exact amount and nature of the food grain grown in, exported from, and imported into the district year by year; (2) the population, and their actual average consumption per head being accurately known, a *reliable* estimate of stocks in hand would thus be arrived at; (3) the estimate of production in the year of failure which must be more or less guess work (and which the people themselves would exaggerate as much as possible), plus that of the stocks in hand, would give the district officer a fairly safe guide as to the amount of grain in his district. But unfortunately a district officer in Bengal has no means of getting at any reliable figures whatever; the population as counted during the Census of 1872, is known with something like accuracy; but as it was not a census taken for the special purpose of famine administration many important details are wanting. He has no means of ascertaining the actual out-turn of any given harvest, he can only guess at it. There is no organized system of inter-district traffic registration, and it is therefore impossible even to guess what grain goes out and what comes in. If there be a railway running through the district, the difficulty is considerably less, as the traffic returns form a good general index to the exports and imports of the district. I should therefore say that, not having sufficient data for reducing his prognostications of distress to tabular forms and figured statements, a district officer would be wise in his generation if he confined himself to acting on the general, and almost intuitive knowledge which every officer has who moves about freely among the people. The conditons of each district in Bengal vary so much, there are so many local peculiarities in each, so many extraneous circumstances which affect the question of the distress in any particular locality, that it is impossible to lay down any fixed rule or course of action for any district. What a district officer should do, if scarcity threatened his district, would, in my opinion, be this:—He would make over the current duties of his office to his joint magistrate or some other senior officer, and move freely about among the people, watching the state of prices, the movements of grain along the principal traffic lines, the general condition of the people, and especially of those coming to the works which he would at once open from road cess funds. If there was no trade or private enterprise, he would arrange for the supply of a small reserve stock of grain at some central and accessible place, and so on. He would instruct his sub-divisional officers to do the same. A district officer in time of famine is somewhat in the position of a general arranging beforehand the plan of a military campaign, he has to change his tactics with every change of move on the part of the enemy. He can fairly well arrange the outlines and principles of the campaign, but not its details.

Mr. O'Donnell.—I should not attempt an estimate of food stocks with the present means of collecting information. I would not feel justified in forwarding an irresponsible guess to the Government; yet what more accurate is now possible. I remember in 1874 the Collector of Tirhoot and one of his sub-divisional officers differed on this point in the proportion of seven to one. Perhaps the very greatest service that the Famine Commission could do is to press, with almost any strength of language, the necessity in Bengal of agricultural statistics, locally and continuously compiled.

The last part of the above question runs thus,—"What numbers of these classes (field labourers, urban poor, and infirm dependents) approximately would you expect to have on your hands, if the food crops in your districts failed to the extent of one-third, half, or three-fourths? and if this happened in two consecutive years." I simply cannot attempt an approximation. These numbers would depend on an infinite number of circumstances, which it is now impossible to predicate. In considering the case of Sarun, one should also want to know the condition of Chumparun and Goruckpore, whence it draws much of its food supply in certain years. Does the question mean that some one crop, which in itself constitutes a third or half the entire food supply, totally failed, or is the third or half to be taken out of each crop, or all the crops? This difference between these two conditions would be immense in the present year in Sarun. If even one-third of the total food supply of the year were now cut out of the *bhadoi*, I believe not only the above-mentioned classes, but crowds of small farmers, would want abundant relief. The district, however, could stand a loss of one-third of all the crops of the year, if the *bhadoi* were generally secured. It would also make a great difference as to the time the failure occurred—a failure of the *rabi* for instance, if severe, would in all years result in the greatest distress, because the period from the harvesting of the *kharif* to the reaping of the bhadoi is so long. In fact suppositional questions, in which only one out of a dozen possible accidents is given, cannot be answered with even a very limited accuracy. At the same time, I may record my opinion that a failure of three-fourths of the crops in Sarun is so entirely improbable that it need not be considered; and that not only in Sarun, but in the whole of Behar, both north and south, no famine, or distress approaching famine, has resulted, except after two consecutive years of failure of crops.

Mr. Finucane.—If I were to form any estimate of old food stocks on *à priori* reasoning, I would assume,—

First.—That the population could make their ordinary arrangements for subsistence up to the time of reaping the crop of serious failure.

Second.—That, foreseeing the approaching failure for some months before the new crop is reaped, merchants and others would keep in reserve some stocks, which (were it not for such failure) would ordinarily be thrown into the market or exported during the month of impending and foreseen failure, that from motives of prudent forethought consumption would be also lessened during those months, and that the savings from these two sources would be probably sufficient to maintain the population for two months after the reaping of the new crop.

Third.—I would next add to the quantity represented by two months supply the produce of the crops which partially failed, and would then consider how far this quantity sufficed for the requirements of the population during the interval between the reaping of the short crop and the reaping of the next food supplying crop. Whether the supply which I have put down at two months would in any given case suffice to maintain the population for one or two, or for how many months, is a question the solution of which could be guessed at by people of local knowledge, and ascertained by inquiry from merchants at the chief trade centres of the district, and from house-to-house inquiries from ryots in selected specimen areas. I now propose to take concrete examples in the Dinagepore District and in the two northern subdivisions of Durbhunga, and apply the above method, adopting Mr. MacDonnell's figures as to areas and population. In both these districts, but especially in the former, winter rice is the chief crop, and the staple food of the people. On this crop (or its proceeds) the population subsists from the beginning of January to the end of August. In August the bhadoi crop is reaped. This crop may not in ordinary years be quite sufficient to support the population from the time it is harvested, to the cutting of the next winter rice crop, but experience has shown that in years when the great winter rice crop fails, a larger area than usual is sown under the bhadoi crop, the produce of which in such years may be assumed sufficient to support the population from and after the 15th of August to the reaping of the next rice crop. Assuming, then, that the ordinary food supplies of 1873 were sufficient to maintain the population up to the middle of January, that two months supply in addition (consisting partly of savings in ordinary consumption during the previous four months, and partly of reserve stocks which, were it not for such failure would have been exported) was also available from the stocks of 1873 the ordinary food supply of 1873 would last till 15th March. To meet the local consumption of the five months 15th March to 31st of August there would be the produce of the rice crop reaped in December and of the rabi reaped in March and April. It is there-

BENGAL.

fore only necessary to see how far that supply is sufficient for the five and a half months.

The following statement shows the deficit calculated on this basis:—

Name of District.	Proportion of principal Crop of serious failure in 1873 to ordinary out-turn of such Crops.	Total cultivated Area in Acres.	Annual Food Out-turn.	Annual Consumption in round numbers.	Monthly Consumption in round numbers.	Requirements for five and a half Months, *i.e.*, from 15th March to 31st of August.	To meet Requirements of these Five and a Half Months.			Difference between 7 and 10 columns, being deficit.	Quantity of Government Rice imported.	Quantity imported by private Trade.	Actual Quantity of Government Grain disposed of.	Remarks.
							Winter's Rice Crop of 1873–74.	Rabi Dry Season Crops.	Total.					
1.	2.	3.	4.	5.	6.	7.	8.	9.	10.	11.	12.	13.	14.	15.
		Acres.	Tons.	Tons.	Tons.	Tons.	Tons.	Tons.	Tons.					I take no account of seed stocks, because they would be kept over and above the two months supply which I assume is saved from old stocks. The "two months supply" is of course a purely empirical quantity which would have to be ascertained by local inquiry in each case.
Dinagepore	4annas or $\frac{4}{16}$	1,688,177	Winter rice - 498,000 Others 86,000 584,000	326,000	28,000	154,000	124,462	1,452	125,914	28,086	39,674	Nil	31,513	
Durbhunga, Madhubani, and Sudder sub-divisions	$\frac{3}{16}$ $\frac{2}{16}$	1,254,980	Winter rice - 425,000 Others 243,000 668,000	414,000	34,500	181,125	86,756	25,000	111,757	69,369	115,906	Nil	77,156	

From these data and calculations, the following conclusions are suggested:—

First.—That in food exporting districts in which winter rice is the chief crop and main food staple (the failure of which crop alone can cause serious scarcity in such districts) it may be assumed that the population can subsist on the produce of the previous year's crops at least up to the middle of January. Supposing the bhadoi next preceding the winter rice of serious failure to be an average crop. This is obviously the case, and supposing the bhadoi a failure, it is none the less the case, because the bhadoi can be an absolute failure only in case of there being no rain right through from June to August, and can only be a serious failure in case the deficient rain-fall occurs at time of ripening of the crop, *i.e.*, in July and beginning of August: in either of which contingencies people are forewarned and reserve stocks ordinarily intended for export. In the district of Dinagepore and the north-east of Durbhunga the rabi food supply being insignificant, the failure of the rabi may also be practically disregarded in considering the food supply available at the time of harvesting the winter rice.

Second.—It may also be assumed when the winter rice crop seriously fails in a district of this class that a supply would be forthcoming from the stocks of the preceding year, sufficient to maintain the population for some time after the winter rice harvest. The exact length of time can only be ascertained by local inquiry in each case. The experience of 1874 showed that this time was two months in certain districts; but the conclusion that two months supply from old stocks may be expected in any future case though suggested is not warranted even for those districts.

Third.—That owing to extension of area sown under the bhadoi crops next succeeding the rice crop which failed, the proceeds of the bhadoi will be sufficient to maintain the population from, say, the end of August to the reaping of the next winter rice crop.

Fourth.—That, therefore, in the case supposed (which is the ordinary one) it is only necessary to consider how far the out-turn of the short rice crop suffices to maintain the population for five and a half months.

Fifth.—That in Dinagepore a five-anna winter rice crop suffices for this purpose, and that in Durbhunga a six-anna rice crop supplemented by an ordinary rabi crop would suffice. These results tally with the statements of persons possessed of local knowledge. Assuming the bhadoi succeeding the short rice crop also failed, then the deficit, as worked out in the table, would be increased by the requirements of local consumption for the interval between the harvest time of the bhadoi (say middle of August) and the harvest time of the next winter rice, say beginning of January; and if this winter rice crop again failed, and the failure were very serious, the results would be disastrous and the deficit enormous.

It is unnecessary to pursue the inquiry further in order to quantify deficit. In a district the chief food products of which are rabi crops (wheat, oats, &c.), I would follow the same system in framing an estimate, with this difference that, instead of making my starting point the harvesting of the rice crop, I would concentrate my attention on the rabi, and consider how far the short out-turn of that crop was sufficient to feed the population during the interval between the reaping of the rabi and the reaping of the next good supplying crop. As, however, I have little knowledge of such districts, I refrain from making any such calculations. Supposing private trade equal to the task of importing the quantity necessary to make up the deficit, the maximum expenditure on the part of the State would evidently be the price of that quantity. The State expenditure need only equal the price of the deficit quantity in the extreme case where none of the consumers of the imported grain were able to purchase without State aid. The minimum State expenditure would be where the people were so prosperous that all could purchase from previous savings. The necessary State expenditure may vary, therefore, from nothing at all up to the total price of the deficit quantity of food. What the amount of expenditure within these limits, and what the number of persons may be who would require State aid to enable them to purchase food in case of serious failure in any given district, are questions the answers to which depend so much on the comparative wealth of the cultivating classes, the heaviness or otherwise of prevailing rent rates, the leniency or the reverse of zemindars in realizing their rents in the year of scarcity, and on numberless varying local circumstances of the kind, that I think estimates based on the assumption that certain classes will require State relief, or on similar data derived from census returns showing the number of those classes, cannot be relied upon. The only guide I can see in these matters is the actual experienced results of past famines, which, at best, is but a rough guide.

The following tables show the proportion the numbers who received State aid bore to the total population in the circle of which I had charge—Patiram Circle, Dinagepore District:—

		Per-centage on total.
Total population	66,866	100
(*a*.) Highest number at any time on relief roads	8,000	12·1
(*b*.) Highest number on gratuitous relief	2,608	3·9
(*c*.) Highest number on semi-gratuitous relief	1,806	2·6
Total of (*a*), (*b*), and (*c*), being highest number receiving State relief direct	12,414	18·6

The 12 per cent. included in (*a*) does not, of course, represent the real number of persons who received State aid to enable them to purchase food. The female members of the relief labourers families, as well as young children who did not come on the works, must be also taken into account. It would therefore seem that about 30 per cent. of the population received State assistance exclusive of those who received indirect aid by being enabled, in consequence of Government importations, to purchase food at lower rates than would have otherwise prevailed. I should think no State relief would be necessary in Durbhunga or Dinagepore if the winter rice yielded an eight-anna crop or more. Little relief would be required if the winter rice yielded a six-anna ($\frac{6}{16}$) of an average crop, provided zemindars were prohibited from realizing rents in such years. The case of the food crops yielding only a four-anna (one-fourth on average) crop, or less, being that of 1874, has been already discussed. Mr. MacDonnell's method of figured estimates has been objected to, *firstly*, on the score that the calculations are beyond the power of the human intellect; and *secondly*, on the score that the method is in itself logically vicious. It seems to me that the calculations are simple, provided the necessary data are available, and that it is not beyond the power of Government to make them available. The method appears to me to be the deductive method verified by the results of specific experience, which is precisely the logical method prescribed for all inquires into social phenomena by so great a logician as John Stuart Mill. Moreover, the objections made to the method are objections to the possibility of framing any estimate at all on any method, and are of little force unless it be maintained that the district officer should attempt no forecast of the food requirements of his district, but merely wait and let things take their course.

Mr. Metcalfe. — The great lesson learnt in the famine of 1874 was that the lines of internal trade in India are so marked; and in the absence of railways trade is so dependent upon river communication, and river communications so dependent upon seasonable rainfalls, that a district which for a number of years has always been an exporting district will suffer very great straits from scarcity of food before the direction of trade will turn and convert an export into an import trade. When the rivers are dried up it becomes impossible to convey grain into the interior, except by land carriage which would eat up all profit.

As a general answer to the question put, without entering into minute particulars, I should say, if half the average food crop of a district was lost, and the district was an exporting district, that there would be quite sufficient in that district for its requirements, presuming that the district yielded two crops in the course of the year.

I should assume that there is always a one-year supply of grain stored in a district. The habits of natives are so stereotyped, that I should assume that, under the conditions of a drought for two consecutive years, the mahajuns would, in the case of a district difficulty of access, either wholly close up their stores or issue grain at famine rates only.

To the question how an estimate is to be framed of the number of persons who in a year of scarcity would probably be able to purchase food, and of the number who must be assisted by the State, it would probably be an approximately accurate calculation to assume that two-thirds of the population of an ordinary agricultural village would not be able to purchase food, and that one-third would. But there would be found villages in which the whole population would be able to purchase food. It would be, in my opinion, safer to estimate for the quantity of food required for the whole population of the famine-stricken tract than for the number of people who are likely to require to purchase it; and in addition to this, allowance must be made for outsiders, for this reason that famine and relief works invariably attract people from neigbouring districts, and the local population is thus largely increased by people who really do not belong to the district; even if the rate of wages is so low as not to render it worth their while to stay, yet numbers of people will probably have entered the district and increased the population before the rate of wages fixed by Government becomes known.

Mr. Kirkwood.—Calculations as to the extent of relief which will be required must not be built solely upon the extent of the failure of the crop. The extent of the assured failure must be read with a certain reference to the rise in prices and to the classes of persons seeking relief. Given a partial failure of crops, a famine need not ensue if the crops in the neighbouring districts are good and communications are easy. When a district is ordinarily a surplus producing district, the district officer must inquire first of all what proportion of the usual average crop is kept for consumption. He must deduct the larger portion of his ordinary exports from the average outturn of his crop; he must bear in mind whether from any cause, such as excessive export or from scarcity, his district supplies have been already in part depleted. If thus calculating he can regard the stock which this harvest will leave for local consumption as being three-fourths of the stocks consumed locally in an ordinary year, and the neighbouring districts are not worse off, he may conclude that though here and there a small expenditure will be required to meet distress there will be no starvation. If much less than this is available, he must apprehend a severe scarcity, but one which will probably be met by money expended on works, and, if there are facilities for communication with more prosperous parts, without any Government importation of grain. But if only half the stocks ordinarily available for consumption are likely to be available, and even before that if prices lend a gloomy interpretation to the failure, and of course when the probability is that there will be available for consumption only one-fourth of the stock ordinarily available, Government should, in my opinion, import grain and store it in the more distressed and remote parts—small stores at first, if there are great facilities for importation and there are elsewhere crops readily available, and larger stores in proportion as those remedial influences are less apparent. The object of Government in making such imports should be to keep the price of grain in the distressed parts from passing a fixed high price, which limit should, I think, be three times the ordinary price in a prosperous year.

Government will find it more necessary to import into an ordinary surplus producing district than into one which ordinarily imports a portion of the food required for consumption, because export operations are not readily converted into import ones, whereas existing import operations can generally be easily expanded. It will be long before private import operations percolate into the more remote parts of an ordinarily exporting district. It is there that in ordinary years prices are lowest: it is there that in years of famine prices rise highest. It is not only the actual failure of crop, or the actual dearness of food, which must be considered, but the proportion which that dearness bears to ordinary prices must also be taken into account in gauging the distress.

The district officer thus armed with necessary information, and ready at all points for the crisis, should probably gauge the actual extent to which relief will be required more by the prices prevailing after the temporary lull occasioned by the reaping of a scanty harvest is over, and by the classes seeking for relief than by any other circumstances. When those who are known to have some amount of cultivation and are not purely hired labourers begin to seek for relief, he may be sure that bad times are at hand. But his preliminary arrangements before the reaping of the harvest may thus be summarised.—Where there is only a one-third failure assured he need take no steps, but about April and May should be on the look-out for occasional cases of distress; where there is a half failure assured, he may be sure that he will have to take earlier and more vigorous measures, and he should without loss of time have a limited amount of grain (purchased elsewhere and imported) stored in the more remote parts. With an assured failure of three-fourths of the crop, he should commence at once to pave the way for extensive relief operations. A village inspection should be set on foot in November (if the main crop, which has failed, is harvested in December and January), the names of all those actually needing relief, or likely to need it, should be entered in three or four categories according to the method of relief which may be deemed suitable for their cases, *i.e.*, by earthwork as able-bodied labourers, by earthwork as light labourers, by spinning, by weaving, by gratuitous relief. The date from which the relief would probably be required should in each case be stated. Useful works should be at once opened in many parts of the district, establishments not large at first, but capable of ready expansion, should be entertained, a separate account department should be organized, local committees should be formed, private charity should be stimulated, and a considerable amount of imported Government grain should be stored in the more remote parts.

In my opinion Government should so act that in no famine should prices ever be higher than three times the ordinary rate. How and why this should be done will be explained in the proper place, and in replying to questions 33 and 39 in chapter III. With prices kept at that figure, if the failure is over any considerable area and extends to three-fourths of the crop, I should expect at the worst time to have about 16 per cent. of the affected population on my hands for relief. That per-centage might easily swell to 50 per cent. unless prices are thus restrained. I do not mean that 50 per cent. of the population over any large area will actually be receiving relief; many will die who would otherwise have lived. Thus in Kaladgi District (1877), where prices rose in the marts to six and eight times those ordinarily current (and, therefore, higher still in the remote parts), the highest number relieved was only 17 per cent. of the population, while the Census taken in 1878 points to a conclusion that 20 per cent. of the population of 1876 were missing. Many more than 16 per cent. of the population will actually partake in the relief given to a daily average of that proportion. For women and children all to some extent partake in the wages of their male relatives, field work will be done one day and the relief works attended to the next, and so on.

Baboo Hari Mohan Chandra.—I was a relief officer in this district in 1874. At the first stage of the famine I gave the applicants work close to their homes; but when the works close to their homes were finished, and the number of applicants increased with the increase of the distress, I opened works at 12 or 15 miles distant from their homes, where they went without reluctance and worked. No compulsory means were needed; they went of their own accord. In my opinion the distance test should not be applied at the beginning of the famine; when the number of applicants increases with the increase of the distress, the distance test should then be applied. The people of this district are so averse to leave their homes that I consider a distance of 15 miles a quite sufficient test of their need. My labourers used to stay six days a week away from their homes, and on the seventh day they used to come home once, and again go back to their work. They had made huts by the roadsides to stay there and work. The members of each family had a hut of their own. The labourers were never compelled by me to go to a distance and to stay there, leaving their homes; but they were compelled by their own need to go to distant works and stay there and work. I strictly enforced the labour test, which I think was quite sufficient to keep away persons who were not in distress.

BOMBAY.

Mr. Hewlett.—As regards the amount of food stock in the country, I do not believe any very accurate estimate can be formed. The *Baniahs* and the rich cultivators are in the habit of storing grain in large earthern jars, which are buried either within the enclosure of their houses, or sometimes in the roadway outside. One thing is certain, that however severe a famine may be yet the food stock stored in the country would be sufficient to supply the people with grain if only the owners would open their stores and sell. During the height of the famine, when the price of grain was at its highest, the merchants at Itkal, in one of the worst famine districts, Kaladgi, exported grain in large quantities to Ameengurh, where they obtained higher prices, and when the famine was over it was found that large stores were available everywhere.

Mr. Spry.—No accurate forecast of the condition of the people could be made, at least I know no data which would give a basis for it. Only an approximate one could be made, and that would be very unreliable. Forecasts of this nature were called for by Government from the officers in each affected district, when the famine of 1876 first began to develope itself, but they turned out very inaccurate I think.

As regards the Kaladgi districts, the average food crops there far exceed the wants of the people; therefore, if even half the food crops failed, there would still, I think, be sufficient, but no margin for storing.

Mr. Propert.—I fail to see how a forecast of any value could be made by any district officer. I would far rather arrange for the wants of the district as the season advances. In the case of Khandesh during the past two years of scarcity, my own anticipations were so often at fault that I have ceased to believe in forecasts. In the season of 1876 I have no hesitation in saying that the general crop of Khandesh failed to the extent of between ½ and ¾, and in 1877 to the extent of about ½, and yet at no time had we more than 22,000 persons on relief works, out of a population of about one million, and at the same time the revenue for 1876 was collected with the exception of only Rs. 21,289-8-3, while for 1877 remissions amounting to Rs. 11,099-1-2 only were granted.

From this I argue that, if in spite of the general poverty of this province the general results of the severe scarcity were (if I may use such an expression) *so satisfactory*, it becomes in my opinion totally useless to waste one's *time* in making fanciful forecasts.

Mr. Norman.—The Poona District is bounded towards the west by the Ghauts, and along this range the periodical rains have hitherto never been known to fail. It is, therefore, impossible to conceive that there could be serious failure of crops over the whole area of the district for two successive years. In the more eastern talukas the crops in 1875–76 were very bad, certainly not more than half the average, and the same was the case in 1877–78. In 1876–77 there was, as nearly as possible, an absolute failure. Irrigated lands alone produced anything, and, owing to failure of water, much less land than usual was irrigated. Notwithstanding this state of things, there has been no absolute failure in the grain supply. Prices have ruled higher this year (1877–78) than in the year of famine, but the stocks have been ample to meet all demands. Had the railway been able to carry all the grain consigned to Poonah in 1876–77, it is most probable that the stocks would have been larger, and prices would consequently have been easier. I argue, therefore, that as far as this district is concerned there is no fear, even under the most unfavourable combination of circumstances of any failure in the grain supply. Prices, no doubt, may rise even to a higher figure than they have yet attained, but a sufficiency of grain will be forthcoming, though, in proportion as prices rise more and more, people would have to be supported by the State. A forecast of the state of the crops and the general prospects is now submitted to Government by every collector in the month of December, and it would then not be very difficult to estimate the actual balance of grain in the country and the probable yield of the next harvest. The power of the trade to bring grain into the district can only be estimated by the carrying power of the railway, which can be accurately estimated by that department; but even that power might, in case of emergency, be largely increased by doubling the line, a work of no great difficulty, and by the employment of bullock carriage. During the last famine, the largest proportion of the population on the works and in receipt of State aid amounted to nine* per cent., and I do not think that, under any combination of circumstances likely to occur, this proportion is likely to be largely increased. I am unable to divide the applicants into the three classes mentioned, viz.: field labourers, urban poor, and infirm dependents, or mendicants, having no returns to guide me.

Mr. Moore.—I cannot answer this question satisfactorily. If there was a partial failure of the crops, I should learn from my *Mamlatdars* what the condition of the people is, and I should act accordingly. If only half the average food crop is lost I think the people would manage very well with the assistance of a good sized work or two for unskilled labour, to which the poorer classes could resort for maintenance. It would be merely a case of high prices. Because there is generally a considerable quantity of food grain in stock and with half crop there would be no lack of food, and the wages on the large works would enable the poorer classes to buy food. I think that about one-fortieth part of the population would probably require to be assisted, say about 25,000.

If one-third of the crop failed I think there would be little or no need for assistance.

If one-half failed, about 25,000 might need relief.

If two-thirds failed, the numbers might rise to 40,000; and if this happened in two consecutive years the numbers would not be very largely increased, because the same classes would suffer, and we should have to continue our support. I do not believe that the comparatively well-to-do classes would come on our hands in the second year.

Colonel Anderson.—No estimate of the food crop would be of very *material use* unless it could be ensured that a known proportion of that crop would come into the market. It is more or less in all grain-producing tracts in the south of Bombay the practice to store grain in pits for many years. It is said that this practice has much decreased of recent years in the vicinity of railways, where the ready means of export have induced quick sales of produce, but it most undoubtedly survives in full force in the inland tracts. In the Kaladgi Collectorate and in Dharwar great quantities of grain were stored over the famine of last year, and only appeared freely in the market as distinguished from Jabalpur grain, as the imported grain was called when rain had fully fallen. An impending scarcity of famine will always induce the hoarding of grain and aggravate the rise of prices.

Ch. II. Qn. 5.

Bombay.

Previous experience of a famine could alone be a clue to the numbers who might require to be fed in a future famine, and that experience might require to be tempered by a knowledge of the degree of strictness with which the relief of a former famine was worked.

Mr. Robertson.—The forecasts made by the district officers were based on their knowledge of the condition of the people, the crops, &c.; but I do not know exactly the manner in which they were drawn up. Nothing was known as to food stocks; but from about December 1876 the people who buy grain in the markets lived on imported grain, as there was no local grain to be bought. No doubt some lived on their own stocks, but they kept this carefully concealed; yet, after the end of the famine, local stocks began to come out.

Mr. Robertson.—Except in the case of a famine all over India, which is next to an impossibility, such a forecast as is proposed would in this presidency be of no practical utility.

What is more, it could not be prepared with any approach to accuracy. I assert it is quite impossible to calculate the food stocks. Thanks to trade and communications, if half the food crop was lost other places would supply the deficiency. I hold that, except in a universal famine, it is not in this presidency a question of quantity of food, but the question of price, and the absence of purchasing means by the poor. In fact there can be no famine of food.

We have in each village our village forms. One of these, the yearly census as it may be called, is corrected each year. From these we can very fairly gather the number of the poorer classes who will require aid. The estimates sent in by the local officers in this presidency in December 1876, and which were transmitted to the Government of India, were remarkably near to the truth as tested by after experience.

If a famine lasted two consecutive seasons there is no officer who could estimate, with any approach to accuracy, the numbers who would require to be brought on works and on relief. That would entirely depend on the private resources of each person.

Mr. Spry.—The point I would most strongly urge, if called on to make recommendations based on my famine experience, is the importance of making a railway. The district of Kaladgi has a very good soil and a very thrifty class of cultivators, not much in debt to *Saucars*, and they find it so impossible to get their produce away that they bury it extensively in pits; especially so in the south. But Indi taluka is only 19 miles from the railway at its nearest point, and Sindagi 40 miles, and there very little grain is stored, because of the means of export. The inaccessible portion of the district is the part that lies south of the Krishna. There are few grain dealers in that portion—the grain lies in the hands of *ryots* in pits. The custom is that every market day they send in their grain in carts to be sold through *dalals* (brokers); there are three or four such markets in each *taluka*, and in this way those who have to purchase grain—all the urban population, and all rural non-producers who have no stocks—lay in their week's stocks. When the panic of famine began the

BOMBAY.

ryots closed their pits. This panic set in in October 1876, when the failure of rain was assured; partly, too, they combine to strike for higher prices (see my remarks printed on page 245 of the Bombay Compilation of replies). Their action was more due to combination than to panic—many said they would not sell till prices rose to 4 seers per rupee. When I persuaded people to bring in some sacks of grain to sell, I placed a police guard over it to protect it, without which it would have been looted. When the import of Government grain showed the people how easy it was to import, the cotton dealers and merchants whose ordinary business was only export and mainly export of cotton, and who had no stocks of grain, took to import, wrote to correspondents at Sholapur, and brought grain in on carts and camels, and this kept prices down. Thus the Government import created a trade where none existed before, and if it had not been for this there would have been great mortality and general anarchy and robbery. The grain import by Government was very expensive, for 240,000 lbs. cost 22,000 rupees, and I consider that this may be taken as a proof that Government can only enter into such business at a greater cost than traders can work at, since there is no doubt that traders could have thrown in the grain at a less cost. If there had been any existing trade, and especially if there had been a railway into Kaladgi, I think Government should not have imported. Afterwards there was no need for further interference, when once trade was set going. But the carriage gradually grew very dear; from Sholapur to Bijapur, 61 miles, in July 1877, the hire of a cart was Rs. 35, and the general rate was from Rs. 20 to Rs. 30. The cart carried rather less than usual, 10 maunds, because the bullocks were weak. At this time a system of carriage by head-loads sprang up. Men went from their villages with a few rupees, bought grain and returned to sell it in their villages or the market. They were not hired labourers carrying for big traders, but men who speculated in a small way with their own little capital. This mostly applies to the parts north of Bijapur, but also reached a little further south. About 3,000 or 4,000 people a day crossed the Bhima ferries and the north-eastern frontier from the Nizam's territories every day on this business. This stopped when the rains in September made the road impassable; but then people became more hopeful and opened their pits. I think on the whole the northern taluks fared best in the famine; other conditions having been equal they had little stocks but easy communications, while the southern taluks had large stocks but little means of communication. But speaking generally the southern taluks are the best off. All through the famine the import trade carried on was entirely put in motion by local dealers sending for grain to other places like Sholapur, Bellary, Belgaum, Hubli, &c.; no big trader from those places sent in any except upon an order from some local man in the Kaladgi District.

MADRAS.

MADRAS.

Mr. Whiteside.—A district officer has available many returns and statistical reports from which he can form with great accuracy a forecast as to the state of the coming season in his own district, while the reports printed and circulated by Government in regard to the condition of adjacent districts place him in a position to calculate how far the state of the surrounding country is likely to affect his own district as regards prices, demands for grain for exportation, &c. But the calculation of the quantity of the stocks of grain actually in hand, and the length of time for which they will last for the support of the local community, is a far more difficult matter. All natives, and especially the agricultural class, are addicted to the hoarding of grain year by year. A prodigious share of the crops as they come off the ground are stored away in under-ground receptacles, the existence of which is jealously concealed and strenuously denied if inquired after. These stores of grain are kept intact, often for years at a time, and are gradually fallen back on when scarcity prevails, or when bazaar prices rise inconveniently. It is impossible to estimate even with approximate accuracy the total amount of these grain-stores, but of their existence in large numbers we have clear and unmistakable evidence afforded in the course of the famine, which has now prevailed in this district for upwards of two years. According to the last Census the population of North Arcot was 2,015,000 persons, and during the famine it was calculated that 1,500 tons of grain per diem would be required to feed those people. But when the famine was at its highest pitch of severity, the largest quantity of grain imported by rail in any one week never exceeded 1,000 tons. It was thus clear that the vast bulk of the population was being regularly supported by grain actually present in the district. The grain dealers' supplies in the large towns consisted chiefly of grain imported by rail, but the great mass of the agrarian population throughout the past two years have been eating their own grain. This is further shown by the fact that when the late raggy harvest was known to be a fine one, and heavy crops were being reaped, large quantities of old raggy were suddenly thrown into the market in various places by people who must have kept them in store throughout the last two years in spite of the enormous prices that could have been realised had they chosen to sell earlier. This district is so well supplied by railways, and there is such an excellent system of road communication from the various railway stations, that no difficulty was experienced throughout the famine in getting stocks of imported grain from the railway stations to the chief market towns. There was, therefore, never a famine of food in the true sense of the word. The secret grain-stocks coupled with the weekly importations by rail amply supplied for the needs of the people. But it was impossible to calculate even with approximate accuracy the amount of grain stored away in the villages, for such accumulation had been made gradually and secretly for years, and though the divisional officers were certain that they existed, the owners would not for a moment admit the fact, partly from a fear lest they should be marked down for a grain dacoity at an early date, and partly lest the Government officials should refuse them State aid as the famine went on.

The real difficulty was lack of money to purchase food at existing high rates.

Mr. Longley.—I admit that, if an accurate forecast could be made, it would be of great utility, but I am of opinion that this is not possible for the following reasons:—

(1.) If the distress is widespread embracing, as in the present famine, ten or eleven districts, or in foreign countries, Burmah for instance, which draws away food stocks from this country, the condition of the people can by no means be presaged, considering the facilities now afforded for exportation, *i.e.*, sea-boards, roads, and railways. As an instance, I may say that the stress of the present famine would have been felt later on in Salem if there had been no exports to Mysore in the earlier stages of distress.

(2.) Another element which lowers the value of the forecast is that the mere fact that the estimated stock in the country can feed so many thousands of people for so many days is no index to the quantity required *to be supplemented*, for, when distress commences and prospects appear doubtful, a great number of those agriculturists and proprietors of land with whom the stocks remain withhold contributing to the general market either in hopes of getting still higher prices or in view to guard themselves against the contingency of a greater scarcity, while merchants export all the grain they can secure to places where higher prices rule.

(3.) It must not be forgotten that with distress people possessed of a limited supply of food begin to reduce their own rations. This reduction is in proportion to each person's means or other circumstances, so that a forecast based on the assumption, say, that a male or female of a given age would consume so much in ordinary times would fail to be of much practical value.

(4.) But, supposing that the above elements are absent, there is still a difficulty in making an estimate; for, though the productive power of the country can be estimated, there are no reliable data on which to calculate the existing stocks in the country, as we have no information at present of the actual quantity of normal exportations and importations.

(5.) Assuming the distress to be local, the data for a forecast are (1) the census returns which give particulars as to age, number, sex, &c., of the total population as divided into several castes and classes, and (2) the cultivation returns of the district. Ascertaining the average quantity of food consumed by people of different ages, sexes, and classes, an approximate estimate of the total quantity of food required is arrived at by the help of the census returns. The cultivation returns give us the area cultivated with different crops in Government villages. The average yield per acre of each crop being determined, the total average production of the district may be assumed. It should be noted here that there are no accounts either with Government officers or with Zemindars to show the *cultivation* in the villages belonging to the latter. In fact, Zemindars do not require such accounts, as they collect assessment on the whole holding irrespective of the circumstances under which lands are left waste. This also contributes to lessen the value of the forecast, though for the purpose of this calculation the proportion of cultivation to waste in zemindaris may be assumed to be in the same ratio as in Government villages. The following is an estimate, based on the normal consumption of the population, of the food available for the Salem District (*vide* accompanying statement):—

		Acres cultivated.	Average Yield per Acre. Madras Measure.	Total Yield. Madras Measure.
Yield in years preceding the failure.	Dry food grains.	1,422,393	350	4,97,837,550
	Wet crops	114,427	400	45,770,800
	Total -	1,536,820	-	54,36,08,350
Consumption in the year according to the accompanying statement - -				3,67,541,130
Balance to the credit of the year in which the failure occurs - -				1,76,067,220
Production in a year of half yield -				2,76,804,175
Add the surplus of previous year on the assumption, say, that all above a year's surplus is disposed of - -				1,76,067,220
	Total -			4,52,871,395
Average quantity required for a day throughout the district - - -				10,06,962
Number of days for which the above quantity would suffice - - -				450

N.B.—Population 1,966,995.

The total yield of the district in the year in which the failure occurred together with the surplus of previous years in stock is sufficient to sustain the people throughout the year; but, as the stock is not distributed equally among all classes and peoples, importations would be required to feed that portion who, if the market is not supplied by stock-keepers, are unable to purchase food grain.

The census returns furnish information as to classes who would be able to purchase in times of distress, "occupation" being taken as a standard for determining the same.

Persons of the following occupations may be classed as "able to purchase":—

- Government Service.
- Military.
- Learned Professions.
- Traders.
- Conveyers.
- Domestic Personal Service.
- Cultivators of large holdings.
- Industries—
  - Food.
  - Metals.
  - Construction.
  - Books.
- Indefinite and Non-productive—
  - Property.
  - Unproductive.
  - Others.

N.B.—These classes include holders of stocks as well as those who depend upon the market.

The following classes may be taken as those unable to purchase when high prices prevail:—

- Professions—
  - Minor Professions.
- Agricultural—
  - Small Cultivators.
- Industrial—
  - Dresses.
  - Household goods.
  - Combustibles.
  - Laborers.

These are the classes who require to be relieved by the State. As the number of the adult male population of the several classes is given in the census returns, an estimate can be formed of the numbers of their women and children on the basis of the district ratio. But it must be remembered that all the classes above mentioned will not come in for State aid at once, for, as above stated, they first reduce their rations, and for a considerable period stick to their homes and villages. The numbers, therefore, that will have to be relieved will increase as the distress becomes intense, so that no estimate of them can be formed.

The classes to be relieved are stated above. A great number of mendicants in Southern India do not go to camps or works.

I do not expect any numbers when the failure is one-third or half in the first year, but when it fails three-fourths, then the ryots of small holdings begin to dispose of their live stock, &c. In the absence of necessary materials, and considering the difficulties above indicated, I cannot form an approximate estimate of the numbers that will have to be relieved by the State at the different degrees of failure mentioned in the question, but merely enter the numbers (according to the Census of 1871) which will have to be relieved in the height of a famine in the succeeding years:—

	Men.	Women.	Children.
Minor Professions - -	7,722	7,799	9,778
Dresses - - -	40,056	40,456	50,722
Household goods - -	4,904	14,953	6,209
Combustibles - -	424	428	536
Laborers - -	118,206	119,388	149,684
Sixty per cent. of cultivators -	201,792	203,814	255,534
	373,104	376,838	472,663
Total -	12,22,605		

Ch. II. Qn. 5.

MADRAS.

Mr. J. G. Horsfall.—The population is now pretty accurately known from our census returns. We get returns also showing the extent of land sown with food grains and approximately the quantity of the produce, so that there would be no great difficulty in calculating what proportion of the population could be fed upon the produce of any single year ; but other ingredients step in to make the calculation anything but a simple or certain one. The result of previous harvests, the stock of grain in hand, are most important ; the resources of the district and its production of other than food produce are important disturbing elements. Then again statistics as to the food-grains and other produce in zemindaris are not forthcoming. This needs correction, if necessary, by legislative enactment. The condition of other districts and other markets has also to be taken into consideration, regulating, as they do, the probability of exports and imports, for the merchant will not be deterred from exporting food grains from a district already in famine if other markets are more favourable. Still the primary considerations are the population to be fed and the amount of food grain produced, and with these as his data, with due allowance for other disturbing elements, a pretty accurate estimate may be formed as to the proportion of population likely to be dependent upon relief during the next few months of any year. The estimated yield in food grains of a fair year in this district excluding zemindari lands is 450,000, the population of the same being about 1,150,000, the quantity required for consumption being estimated at 300,000 candies,* thus giving a very large surplus to store and export. The produce and population of zemindari tracts may be assumed to bear the same proportion, thus giving estimated produce of food grains at 560,000 candies, population 1,450,000 with a consumption of 380,000 candies, leaving a surplus of 180,000. Thus half an average crop would leave 100,000 candies to be provided from stored grain or imports ; that is, over 300,000 would be without food. These must be fed by imported grain and by grain already stored. A failure of one-third crop only would merely reduce the amount otherwise available for exportation, but would not necessitate any relief measures at the hands of the State.

It is questionable whether the failure of one-half the crop would even necessitate State interference. The crops in this district for the year 1877–78 were estimated at little more than half an average crop, and yet no relief has been administered since the commencement of the year. Prices have pressed very hardly upon all three classes, but actual State assistance has not been found absolutely necessary.

The loss of three-quarters of the crop would leave sufficient produce to meet the wants of one-third of the population only. Two-thirds of the population would be dependent in such case upon stored grain and importation. I should expect 5 per cent. of the population to come upon relief in such a case.

For the reasons stated above the loss of one-third crop in two consecutive years would not entail any State relief.

For a second year with only half a crop the proportion to be relieved would not exceed two per centum of population. As a matter of fact, after two years with only half the average yield, we have now in this district no relief measures or State aid whatever. In the case of three-quarter failure of crops in two successive years twenty per centum would probably require Government relief.

Mr. Price.—I should start by assuming that the population of the district consumed, on an average, $1\frac{1}{2}$lb. of grain per diem, which, from frequent observation long before the famine, I believe to be a fairly correct estimate. I would then take the area of crop actually reaped in the preceding year and the area cultivated in the year up to date of the forecast, compare this with the cultivation at the corresponding period of the previous year, and so make some approximate estimate of the cultivation for the whole of the year under consideration. I should then calculate, by taking the reported outturn of the previous season, and making such deductions for the difference so far observable in the two seasons, as appeared to me to be right, what the probable out-turn would be, and, by putting this into pounds, would be able to estimate for how long the people of the district could be supported by the crop of the year for which the forecast was made, and how much grain in the way of stock might be taken to be in hand. In a district such as this it is with rare exceptions that any stock of more than a year's standing is kept on hand. In Cuddapah and Bellary, where much grain is buried, it is absolutely impossible for any reliable estimate of what stock of grain is really stored to be made. The sequel of the famine showed clearly enough that, in places where the most experienced native officials stated the opinion that there was no grain whatever, large quantities were hoarded. I see no other way than that suggested of framing a forecast ; at the best no officer, even one intimately acquainted with his district, can make anything but a very rough calculation. If he allows, on the unfavorable side, a liberal margin for error, he will place himself, though he may not be very accurate, on the safe side.

Take that the average annual crop of food-grains of all kinds in this district is 279,812 tons (which is something about the mark). Half of this would be 139,906 tons. The population as per census of 1871 was 940,747. Allow a daily average consumption of $1\frac{1}{2}$lb. per head. This would give 222 as the number of days for which the population of the district could be supplied. The difference would have to be made up by importation. The estimate of the number of persons who would probably be able to purchase food would entirely depend upon whether the failure of crop was for the first or second time; a failure of one-third would for the first year cause no appreciable indication of pressure, excepting perhaps that prices might rise a little; a failure of half would cause a demand for employment towards the close of the season, which ought to be met easily enough by the ordinary work of the district ; and a failure of three-fourths would probably create a necessity for small special works, but not relief at home. As to what the percentage of the population which would thus come upon relief would be I can form no estimate. I would not have touched on the subject at all had I not seen in 1866 the case of a failure of three-fourths crop in the Salem District. There was then certainly no visible distress in villages, but the people clamoured much for work. Some comparatively small sums were spent upon new roads, but what the proportion of people who came upon the works was I have no means of stating. I recollect that they were in the main agricultural labourers. A failure of one-third for a second year would not, in my opinion, throw any appreciable number of persons unable to buy food on the hands of the State; a failure of half would call for assistance on the part of the State to 10 per cent., and of three-fourths crop of something like 20 to 25 per cent. The figures of relief operations should, in my opinion, most decidedly not be taken as the basis of any calculation as to how many persons out of the population of any particular district may, under certain known conditions, be expected to come upon the hands of the State in the event of the failure of crops. I make this remark in reference to my personal experiences in the districts of Bellary, Cuddapah, and Chingleput. My reason for it is that I am aware that very many individuals were admitted to relief of all kinds who ought not to have been.

Mr. Martin.—In this division I should say that a failure of one-third of the average crop even for two years would not produce a necessity for relief. If half the average failed, I should expect that relief would

---

* *N.B.*—This cannot be right if the candies were intended to denote the usual measure of weight. Tons would be near the mark.

CH. II. QN. 6

MADRAS.

not be required if the failure was equally spread, and if the rain-fall was sufficient to produce wild vegetables and to prevent the fish and other animals which live in the water from dying, but if this failure of half was not equally distributed, there would probably be distress in the part where the average production falls below half, and the distress would vary with the extent of failure; thus, in a tract inhabited by 100,000 people I should expect to have seven thousand on relief if the failure extended to three-fourths. If this distress was repeated for a second year, I should expect to have fifteen thousand of the people of this tract on my hands, and moreover people from both the tracts in which the failure was both half and less because of the high prices. The numbers would in all probability be 5 per cent. of the whole population of these last tracts.

If the failure was three-fourths the average, this would probably mean that there was no production at all in part of the tract, and that only a small part would have as much as half. I should expect to have 10 per cent. of the whole population on my hands before the first year was over, and if the distress was continued for a second year, I should not be surprised if the numbers went as high as 30 per cent. It is exceedingly unlikely in this division that a failure amounting to even half of the crop will be protracted, for any heavy rain, even though it may be sufficiently heavy to seriously damage the general harvest, must supply the wells, and the moment the wells are supplied, labor is available and a crop is put down. In a very bad season the crop raised comes to market in sixty days, and as the wells are capable of yielding a total weight of 33,000 tons, the relief from them will be very rapid and will speedily alter the ratio of the production to the average.

MYSORE.

MYSORE.

Mr. Ricketts.—If the food crops failed to a very notable extent for two consecutive years, it is clear that owing to deaths from starvation and disease, &c., the number on hand in the second year would be considerably less than in the first year.

Taken by itself the loss of half the average food crop of the district might not prove very disastrous, if the previous seasons had been good and the people were flourishing. I will assume that the existing food stocks and the power of trade to bring in more are elements sufficient to supply the quantity of food grain actually required for consumption, and all that is wanted is money to purchase food; but how much money would be so wanted and how many persons would have to be relieved by wages or by food would depend not only on the current famine prices of food, but the proportion they bore to current rates before the famine. Forecasts are further delusive in that during the actual period of famine the additions to the number requiring relief are of daily occurrence, as fresh villages, and even groups of villages, suddenly and sometimes without previous warning fall into the ranks of the famine stricken. As a famine progresses, and knowing what is being done and what is proposed to be done, it is possible to make some forecast, but in my opinion not before.

QUESTION 6.—MEASURES FOR MEETING TEMPORARY DISTRESS.

CH. II. QN. 6

What measures should the district officer adopt for relief, supposing that he believes the distress to be temporary, or is not satisfied that it is indicative of approaching famine? Should applicants be first employed as far as practicable on the ordinary works in progress, whether under provincial or local officers or under agents of the Public Works Department or municipalities? Under what tests should applicants be admitted? Under what circumstances may it be desirable to open special works? How should such special works be arranged? Whether so as to collect the applicants in comparatively large numbers at a few localities, or to give them employment in smaller bodies at many places in the distressed region and in the vicinity of their homes? May such works be best placed under the Public Works Department or under Civil supervision? State the arguments in favour of and against either course? How may the Public Works officers be best placed in communication with the district officers for these purposes? How should the Public Works officers be guided in their selection of works for relief? And on whom should the responsibility rest in the district for seeing that all needful steps are taken by all branches of the public service concerned?

Punjab.—6 answers are given. They are in accord with the views of the Bombay and North-Western Provinces officers.

North-Western Provinces.—35 officers have answered. The purport of the answers is similar to that of the Bombay replies. All applicants should be admitted.

Bengal.—17 answers are given. They agree that first ordinary and then special works should be opened, but some officers advocate more numerous works near the people's homes as the distress deepens.

Bombay.—15 officers have answered the question. Their views are—

That distressed persons should be employed in the first instance on the ordinary works of the season. That the year's budget grants should be re-appropriated from works requiring skilled to works requiring unskilled labour. That special works should be opened as need increases. That they should be large and few, and not near the people's homes. That they should be under the Public Works Department, the officers of which understand the management of works. That the general responsibility for the care of the distressed people should rest on the collector.

Madras.—39 European and 5 Native gentlemen have replied to this question.

In the early stage of temporary distress it is generally considered that a vigorous prosecution of the ordinary works in a district—provincial, local, and municipal—will be sufficient to meet the enhanced requirements for employment, and at this period a fair day's work for the usual wage is thought to be the only requisite test.

The majority of the officers consulted seem to think this would suffice at a more advanced stage of operations, as a general rule, which might, however, require modification with reference to works in the vicinity of large towns.

Special works should be put in hand immediately the ordinary works in progress fail to meet the demand for employment, and to meet this emergency promptly the plans, estimates, &c. for such works should be prepared beforehand. These works should be disposed so as to economise supervision, to be within moderately easy access of those needing employment, and to avoid the collection of unwieldly bodies of labourers in one locality. If long distances have to be traversed to reach relief works, people really needing employment

H. II. Qn. 6.

will hesitate to go because of the difficulties of returning to their ordinary avocations should a favourable change of season occur. There is some variety of opinion as to the agency under which these special works should be prosecuted; but it is almost unanimous that, so far as professional supervision is concerned, they should be entirely under the Department of Public Works. As regards classification of labourers, issue of pay, sanitary and medical arrangements, and the general welfare of the labourers, it is thought that civil agency might advantageously be employed.

The Collector should be held responsible for the proper conduct of famine relief operations, and to this end all departments must work in subordination to him. The relation of the district or superintending engineer to the Collector would be that of professional adviser, and in the selection of works they should act in concert.

PUNJAB.

PUNJAB.

Muhammad Hayat Khan.—If the distress be temporary, it would only be necessary to provide the people with employment in the public works that may be going on at the time in the district, be they under civil or Public Works officers; but if the distress assumes a severer aspect, special works would have to be opened. All important works that require engineering skill should as a rule be entrusted to the officers of the Public Works Department; but in respect to forming gangs and making payments to them, the work should devolve upon civil officers. It would be difficult to give the people work in the vicinity of their home, as the advantages thereby secured to them will be comparatively much less than the loss which Government will suffer by the arrangement. Moreover, it will tempt the people who can afford to support themselves somehow or other to try to get themselves admitted into the relief works. Relief works should as a rule always be opened in places where works of public utility are needed, and which will be of permanent benefit to the people in general, but they need not necessarily be very far from the home of those who will be employed in them, and should, if possible, be within the tahsil in which they live.

Lieutenant-Colonel Parsons.—(*a.*) Ordinary works in progress, if within the capacity of all comers, are well adapted for relief purposes, otherwise special useful works should be started, more especially earthwork.

(*b.*) Works should be opened to all comers, as, if tests of apparent distress be applied, it is difficult to know that an applicant may not be on the verge of distress.

(*c.*) The locality of the works would depend in a measure on their necessity as relief works. (*d.*) If famine be extensive, it is difficult to arrange a sufficiency of small works, but an extreme of the distance test is not advocated. (*e.*) For the larger works, the supervision of Public Works officers is best on account of their professional qualifications and time at their disposal, but when works are not of an extensive nature, civil supervision is sufficient, and best suited to the peculiar requirements at such times. (*f.*) Public Works officers would be placed in communication with the district officers at such time as they received departmental orders authorising the required measures, and would consult district officers in their selection of works for relief. (*g.*) As the refusal to admit labourers in any case is not recommended, the responsibility for keeping the works in progress would rest with the supervising officer. It is not quite understood to what reference is made in the words "needful steps" at the close of question 6.

Mr. Roberts.—If liberal and timely suspensions of the land tax were made or promised, I do not think any special relief measures would be called for among the village population in any case of merely temporary distress, but that the proprietors, in comparatively easy circumstances, would, when relieved from this burden, readily undertake to provide for the poor of their own villages. In towns gratuitous relief should after a while be provided for the blind, lame, and helpless, and work for artizans thrown out of employment. At the very outset, and before hunger had had its effect in reducing the strength, I do not see any reason why applicants for relief should not be employed on works already in progress, whether under engineer or civil officers, in the same way as ordinary coolies, without any distinction. In that case no test would be needed. When, owing to the progress of famine, it becomes necessary to pay subsistence allowance to persons who cannot do a full day's work, special works must be started; and to avoid the demoralization of voluntary labourers, the two classes should not be employed on the same works. Classified gangs should be formed, and as a test of necessity, a minimum subsistence allowance given for tasks graduated according to the strength of labourers of different classes. Large works are preferable to small ones, because less difficult to supervise, and the agency of Public Works engineers better than that of civil officers, because they can devote more time and care to the management. The district officer must be responsible for seeking out the needy and sending them to the works, and for securing efficient aid from his subordinate establishment, and he should be in direct communication with the engineers in charge of the works. When large works affecting the interests of several districts are projected, the local government should select the schemes to be carried out; but, in the case of district roads and local irrigation works, the district officer and commissioner will be the best judges of their expediency.

Mr. Nicholl.—Applicants should, as far as possible, be first employed on ordinary works under local officers; no special tests should be applied.

Officers in charge of works can always satisfy themselves by inquiry and from appearances, whether applicants are really in want, and whether they should be employed or not.

Special works should only be opened when ordinary works do not give sufficient employment to all who apply.

If the distress in its first stage is general throughout a province or large tract of country, the employment of small bodies at many places in the distressed region and in the vicinity of their homes, is, in my opinion, the better plan.

The employment of large bodies at three or four localities in each district would only become necessary when the distress began to assume the features of a famine, or at the commencement of the second stage. At this stage the numbers requiring employment would be enormous, and the agency required to superintend them in small scattered groups would require to be in proportion.

Works requiring skilled labour would be best placed under officers of the Public Works Department, but works requiring unskilled labour might with advantage be placed under civil officers. My reason for offering this opinion is because the employment of professional men on large salaries to superintend earthwork, such as making roads, the lines of which have already been laid out, would be a waste of power and money. Men competent to superintend such works can always be obtained by civil officers for small salaries.

A deputy commissioner has always under his orders in some department or other, men acquainted with his district and the people, whom he could make available to exercise a general superintendence over works placed under him, so that the extra men would only be employed to augment his existing resources, and look to details.

Public Works officers could best be brought into close communication with district officers by being placed directly under them. This would be desirable in every way. The district officer is not only the principal civil officer in the district, but he is supposed to be better acquainted with the wants of the district and people than any other official. He is the man to whom the people would naturally look in time of trouble, and men working under his orders would receive willing obedience from the people.

Mr. Benton.—If it be believed that the distress is only temporary, I think that the district officer should arrange to provide for relief by commencing works of an ordinary character in the distressed tract, suspending other works elsewhere in order to provide the necessary funds, whether from district or municipal sources. These works would be carried on under the ordinary agencies, and not under the Public Works Department. The wages given should, I think, not be subsistence wages, but only slightly under the ordinary rate, so as to test the demand for work.

There would be no loss in this, as the ordinary tasks would be demanded, and inefficient persons would not be admitted on the works, which would be carried on with much greater ease. Full wages being paid, or nearly so, the able-bodied would be able to support their inefficient relations as in ordinary times. This system would be pursued until labour could be procured at rates considerably below the ordinary rates. This would be a sure sign that the distress was intensifying, and that a change should be made from payment for labour at full rates, to the exclusion of inefficient persons, to subsistence wages with admission of all persons who could perform any labour. If there were very serious distress, the district or municipal funds would not long bear the strain, and it would be necessary to apply to Government for assistance, and this would probably be the most suitable time to open special works. Government might be willing to expend money on works of an imperial character, while it would not be willing to spend Imperial or provincial funds on ordinary local works. These special works would of course, as far as possible, be works of a useful or even remunerative character, and this condition would probably leave little choice as to whether the applicants for relief should be collected in large bodies at a few places, or at many places in the vicinity of their homes. In any case the works would be near the homes of a number of the applicants for relief, which is no doubt an advantage, provided care be taken that the relief works are not abused; and I would not be deterred by any fear of breaking up homes from calling on the others to move for a time to works at some distance.

I think that generally these works ought to be under the Public Works Department, as they would probably be works of importance demanding engineering skill; but in any case, as they would by the supposition be attended by crowds of people who were too numerous to be relieved on petty district works, keeping order among them, exacting sufficient tasks, and executing the work in a proper manner, would no doubt be very difficult tasks for even professional officers with well trained subordinates. The want of trained subordinates for this purpose was severely felt on the works undertaken in Karnál last year, as the work was badly done, and the exertions of the labourers were not by any means turned to the best account.

I should think that tests for admission to works, whether ordinary or special, conducted on the system described above, were scarcely necessary. On the former works the applicants for relief would be required to give a fair day's work for something less than an ordinary day's wages, and in the latter they would be required to perform a reasonable task according to ability for a subsistence allowance.

I think the Public Works officers should carry on these works, just as other works, under the direction of their departmental superiors; it being well understood, however, that the immediate object in executing the works was to provide relief for the distress. It would, however, be competent to the district officer to give any order in writing concerning the admission or treatment of distressed persons to the Public Works officers; and the Public Works officers should be bound to carry out the same whether they approved or not, pending a reference to departmental superiors, who would immediately be furnished with copies of the same, together with the objections of the Public Works officers if there were any. If departmental superiors could not agree, a reference to Government would be necessary. This procedure would be similar to that provided for the interference of the magistrate of the district in jail management.

With this provision the district officer might properly be held responsible for the entire management of relief operations, so far as they affected the treatment of the distress as apart from the execution of the works, which would be carried out in accordance with plans and estimates sanctioned by the proper authority. In this way the officers of the Civil and the Public Works Departments might be restricted to matters within their respective provinces; but it is unnecessary to add that, without an earnest desire on the part of both to work in concord as far as possible, continual jarring and cross purposes might be anticipated.

NORTH-WESTERN PROVINCES AND OUDH.

North-Western Provinces and Oudh.

Mr. Sells.—All relief works should, in my opinion, be such as can be executed by utterly unskilled and unintelligent labourers. This is the most important point for consideration in determining the comparative suitability of projects. In municipal towns the committees will, as a rule, be able to afford employment to a considerable number; sanctioned works giving place, if necessary, to other extemporized work, if the latter are of a more suitable nature. In other places, the Public Works Department should co-operate with the district officer, and works determined upon by the latter should be carried out under the supervision of the former. If the sanctioned projects of the Public Works Department are of a suitable nature, no special works need be started, possibly; but if they are not suitable, that is, if they require more or less skilled labour, special work should certainly be started. For ease of supervision such works should be few in number, and should be fairly distributed in the most distressed parts of the districts. Large numbers at three or four places that would be, I should say, readily managed, than small knots of labourers scattered about at distances of every five or ten miles. Supply of food also can be better regulated.

Captain Home.—District officer should consult with executive engineers as to what works, for which provision has been made in the budget, can be started, or, if already started, pushed on with more vigour. He should at the same time report to the commissioner, who would put himself in communication with superintending engineers.

Ordinary works in progress should be utilized as far as possible.

Subsistence allowance and task-work should be the tests.

I. II. Qn. 6.

NORTH-WESTERN PROVINCES AND OUDH.

Special works would only be opened in case of there being no ordinary works available, or if distress increased.

Special works should be arranged so as to collect the applicants in comparatively large numbers at a few localities; this is necessary in order to ensure proper supervision and economy.

Special works should be under the supervision of the Public Works Department, because its officers are in the habit of dealing with large gangs of labourers and of portioning out task-work. Want of experience in such matters is sure to lead to waste of money and laxity of discipline. At the same time the works should be visited from time to time by the district officers in company with the executive engineer, and all requirements and alterations discussed and settled on the spot as far as possible.

Works for relief should be selected on the following principles:—

1st. They should be works which can for the most part be executed by unskilled labour.

2nd. They should be works of utility, and, if possible, of necessity; that is to say, works which must be carried out some day, but which have been postponed for want of funds or other causes.

3rd. At the first outbreak of distress, works of moderate size, or works which can be divided into self contained sections, should be selected, so that in case of the distress passing off, Government may not be committed to a large expenditure to complete them.

The collector should be responsible for seeing that all needful steps are taken.

Mr. Cordner.—(*b.*) I think applicants for work should, as far as possible, be employed at first on ordinary works in progress in a district, so long as such employment of them does not interfere with existing contracts, as it would not be fair to contractors to insist on their employing such labour after taking up a contract.

(*d.*) Special works should be opened as soon as it is apparent that overcrowding is likely to take place on ordinary works in progress. Such special works should be arranged for in consultation between the Civil and Public Works Department officers.

(*e.*) Supposing the relief to be of a temporary nature, I think small works near their homes the best, and the reverse if the distress is likely to be lasting.

(*f.*) Petty works such as do not require any engineering skill are better under the civil officers.

(*h.*) Public works officers will be best guided in selecting relief works by consultation with civil officers as to what will be a permanent improvement to the district or province.

Major Jeffreys.—(*a.*) He should induce the Public Works authorities to push on or extend all ordinary works sanctioned or in progress.

(*c.*) Under the labour test strictly applied, *i.e.*, working through contractors at the ordinary contract rates.

(*d.*) Special works other than sanctioned and ordinary should not be opened until a considerable amount of distress is apparent.

(*g.*) Under the Public Works Department certainly.

(*h.*) The advantage of placing them under Public Works officers is that you get the necessary technical knowledge to prevent any serious mistake of construction, such as inaccuracies in digging levels, &c. The measurements are more likely to be accurately made. The Public Works Department has a large staff of European subordinates, who, properly supervised by competent assistants, are more likely than any civil agency to prevent the development of those abuses which are certain to follow the working of an establishment composed entirely of natives, such as a department presided over by single civil officer would be.

The advantage of a civil officer would be that he would better understand the native character, would find it easier to prevent desertions, by apportioning the severity of the task to the character and class of people with which he has to deal; but on the other hand it is likely he would be more profuse in the expenditure of Government money.

(*k.*) Those which would be most useful to the country.

(*l.*) On the Collector.

Mr. Colvin.—Open ordinary works experimentally.

Yes; under Department Public Works and also in municipal works.

I would admit all who come, but they would be paid by the work done at ordinary rates. If experience shows that the works were largely attended by classes who ordinarily do not come to them, and who from inexperience could not work at Department Public Works rates, special works should be opened.

Mr. Sandys.—The ordinary works in progress in this district would not, I think, afford sufficient relief even if the distress were to be temporary. If there were any distress it were necessary to relieve, it would last with more or less severity for six months at least, and special works with light task-work to commence with should be started without delay, and before the classes requiring employment are reduced in condition. The distance and wage test should be rigorously applied.

Supposing the special works to be taken in hand in good time, the able-bodied applicants should be collected in large numbers at a few localities and be engaged on works placed under the Public Works Department. The money thus spent in supporting those requiring relief would be expended on works of real public utility, and with the limited Public Works Department establishment and difficulty of largely increasing it on a sudden emergency, the supervision would be more effective.

Applicants who would be placed in the efficient gangs should alone be given employment in the district to which they belong, if there were no large works in hand there; and it would, I think, be better to employ these inefficient gangs in large numbers at a few localities, so as to admit of the completion of the most important of the district works and of a more efficient superintendence. Experience shows that employment will have to be given for at least six months, and if the small works in the vicinity of the homes of the applicants are started under civil supervision, a large number of persons are attracted who do not require relief at all events at the earliest stage of the scarcity; the small works are comparatively of small public utility, and civil supervision, owing to paucity of officers and want of professional knowledge, is sure to be weak. Public Works officers can best be placed in communication with district officers by being appointed, as they are in these provinces, to the staff of the district officer, and by being required to be guided by the advice of the district officer in the selection of works for relief and number required to be taken in hand.

The district officer must be held responsible for seeing that all needful steps are taken by all branches of the public service.

Mr. Tracy.—Relief works should be commenced tentatively. Employment should first be offered on ordinary district or municipal works. All applicants should be admitted who are willing to work for subsistence wages. If the applicants for labour on these terms become too numerous, special works be opened. I am in favour of giving employment at many places and in the vicinity of the homes of the distressed. Small bodies of labourers are more manageable and less likely to suffer from epidemics, and if near their homes, their labour would be available to their usual employers in the event of a favourable change of season. At the outset it would be better to employ the distressed on such works as the repair and maintenance of the district communications, under civil

Ch. II. Qn. 6

North-Western Provinces and Oudh.

supervision. Should these prove inadequate, larger works, such as canals and railways, should be provided under the Public Works Department. These works would be selected by Government. The Public Works officers should be required to employ labourers in accordance with the rules prescribed by Government for relief works, and should submit their returns through the collector. The district officer should be responsible for seeing that all needful steps are taken by all employed in his district.

Mr. Mellor.—If it be likely that there will be at no very distant period general employment in the fields, it is obviously better to give employment on small works which will be quickly completed, and which will not take the people to any great distance from their homes, than to open a large work. At the same time a large number of small works are more difficult to supervise than one big work. I consider that the management of the works should be under the Public Works Department, but that the civil authorities should select them.

Mr. Leeds.—I should advocate works under the Public Works Department, the civil staff being everywhere too limited to deal satisfactorily with such matters otherwise than in the way of general supervision. One or more centrally situated works are, I think, preferable to a number of petty works at many places in the distressed region. The nearer the works are to the people's homes, the larger is sure to be the number of those who resort to them, and the reality of the distress can therefore be best tested by forcing applicants for relief to go a certain distance.

Mr. Lawrence.—After the ordinary repairs have been completed I would advocate the employment of distress labourers on other district requirements. There are always roads which will be the better for raising. But when famine has declared itself, I would mass the labourers. Proper supervision over large numbers, if scattered, is impossible. The only tests I know of are enforced residence and the labour test. But there may be times when the prevalence of disease will necessitate resort to small works. All the works should be in charge of Public Works officers, under the general supervision of district officers. The latter select the works, arrange for supplies, hut and pay the labourers, and are generally answerable for the management, but the less they interfere with the Department Public Works officers the better. The latter, if they are worth their salt, take interest in all branches of the management, not in construction only. He is on the spot with a large staff of assistants, all of whom can do something beyond mere construction.

Mr. Whalley.—If the district officer believes the distress to be temporary, he should at once exert himself to the utmost to obtain suspension of revenue in the tracts most affected, and in the villages where he can depend on the zemindars co-operating with him. The suspension should be generally conditional on the zemindars supporting and employing their own poor. To aid them in doing this takávi should be liberally given for agricultural improvements. At the same time public works should be vigorously pushed on, on the ordinary system, and contracts offered on favourable terms to zemindars who have no other way of employing their poor. I know this has been tried and failed or been very partially successful. I could give reasons for its having failed, but I know of none why it should not succeed if properly managed. Relief works should not be opened until the number of destitute is evidently too large to be relieved and employed by the zemindar.

Small relief works should then be opened under the supervision of civil officers in the most distressed parts. If more is necessary distress has passed beyond the temporary stage. Then it becomes necessary to start large works under Public Works officers. These works are better at a little distance, say 20 or 30 miles, from the scene of distress. They should be fed from the civil officer's works, and the latter in turn should draw from the zemindars works, which having served their purpose, would be gradually depleted and wound up.

The civil officer's works, too, will be gradually turned into a machinery for collecting and forwarding destitute labourers to the public works branch, until the whole of the relief labour is concentrated in the hands of the latter.

Mr. Cornwall.—As a preliminary measure, the works in the district budget for the year will probably be found sufficient, and they could be utilized tentatively. The opening of special works before the necessity for them is apparently established tends to demoralize the people and does more harm than good. At first applicants might be admitted upon a task-work calculated to give them a somewhat lower rate of pay than ordinarily obtainable: and if numbers come upon those terms it would show that distress was increasing and the time for opening special works had arrived. Then the large schemes reserved for such occasions can be taken in hand.

The question as to the employment of large numbers at few places or smaller numbers at more places seems entirely dependent upon the amount of supervision Government is prepared to pay for. Large numbers at few localities are more easily supervised, and the work is consequently better and more cheaply performed. The cost of removing the huts as the camps are moved is nominal, and frequent changes are, from a sanitary point of view, to be recommended. All such works should be left under the immediate control of the Public Works Department. The district engineer should be informed by the Collector of the work he was to take in hand from time to time, and a sufficient staff of officers allotted to him to enable proper supervision to be carried out. The relation now existing between the collector and district engineer might be retained with advantage; the former having a general superintendence of the works, and the latter being responsible for carrying out all orders. The employment of the civil staff in immediately supervising works seems objectionable, inasmuch as it necessitates other officers being appointed to do the ordinary district work; and in the lower grades it is better that outsiders should be employed upon superintending the actual relief works than that tahsildars should be deputed for this purpose, and their places filled by men new to the district. By making over the relief works to the direct superintendence of the district engineer and his establishment the civil staff of the district has some slight degree of leisure for systematic inquiries village by village. In the event of famine being either imminent or being actually present, Government will presumably in future, as was the case in the North-Western Provinces last year, have in readiness certain projects for execution in each district, and delegate to the commissioner power to authorise collectors to commence such works when necessary. On the work being started, the collector and district engineer should be in direct communication with each other, and it should be left for the collector to decide, with reference to his knowledge of the general state of each pargana, what works are from time to time to be undertaken. The district engineer, in his capacity of officer in immediate charge of the works, should be responsible for carrying out all orders of Government; but it will of course be the collector's duty to inquire frequently and ascertain whether all that can be done is being done, and to see that no departmental friction interferes with the attainment of the objects in view.

Mr. Webster.—Yes. I think that in cases where there is reason to believe that the distress is likely to be only temporary, the applicants for relief should be employed on the ordinary budget works under the Public Works Department.

Ch. II. Qn. 6.

North-Western Provinces and Oudh.

When distress increases and it appears probable that it will be more than temporary, special works should be opened; it would then be the time to take out the matured projects above referred to and put them in hand.

The work should, in my opinion, be so arranged as to collect comparatively large bodies at few localities. Supervision of every kind, professional, sanitary, organizing, &c., is only efficiently possible when the people are collected in comparatively large numbers. The system of having numerous small bodies of labourers on relief works scattered all over the country is open to every possible objection. Waste, peculation, and malpractices of all sorts can go on unchecked because of the almost impossibility of efficient supervision over such scattered bodies. I would place all such works under the Public Works Department, because the officers of that branch are in the habit of supervising works, and consequently know much better than the civil officers what amount of work a labourer is likely to be able to render, and are therefore far less likely to be imposed upon by persons desirous of getting the maximum of relief with the minimum of labour in return for it. I would work through the existing district and divisional establishment. Putting the works under the district engineer and his subordinates, ordinary and extraordinary, I would leave all arrangements primarily in his hands with one exception—the district officer should select the works for relief and should see them put in hand in order of their utility, as noted above. The district officer should be responsible that adequate arrangements are made for food supply and for payment of the labourers. Sanitation and arrangements for shelter should be left to the Public Works Department. If the district officer should be of opinion that the works are not being carried on satisfactorily, *i.e.*, that the rates are too high or too low; that the tests prescribed by Government are not being properly carried out; or that there is any other reason to be dissatisfied with the way in which the Public Works Department is doing its work, he should not issue orders direct, but should report at once to the commissioner of the division, who will depute his executive engineer to inquire into and, if necessary, to rectify matters.

Mr. Adams.—Assuming that there is still a prospect of saving the harvest, and that consequently the distress may be temporary only, I am certainly of opinion that as far as possible ordinary works only, *viz.*, those which would have been constructed in the ordinary routine from the budget of the current or the following year, should be used for relief.

I am most decidedly of opinion that the work should usually be under the charge of the agents of the Public Works Department.

With reference to the cause, "character of the people," I would point out that in this part of India the objection of the people to going to any distance from their homes for receipt of State aid is so strong that it will always, I believe, be necessary to recognize it in greater or less degree, and to supply work within what they consider a reasonable distance. But so far as is possible, having regard to this and also to the possible supplies of food and water, I think that labourers should be collected in comparatively large numbers. With large bodies supervision of work and proper adjustment of relief would be much easier than with a number of small parties of labourers often scattered at considerable distances from each other.

Mr. White.—In temporary distress, applicants should first be employed, as far as possible, on the ordinary works in progress in the district. At this stage there should be no test but that of full labour. As this source fails, relief works should be opened, and they would be all the better if situated in the distressed region and in the vicinity of the people's homes. The works should be professionally under the Public Works officers, but otherwise they should be under the orders of civil officers. The responsibility should rest on the district officer, but then he must be armed with full powers. The other queries in this question are better answered by higher authority.

Major Liston.—If the distress is only likely to be temporary, I am strongly in favour of employing applicants for relief on the ordinary works in progress. It must always be borne in mind that the cultivating classes have not only themselves and their families to support, but also to look after their bread winners, their cattle. If special relief works are at once opened and the famine rate of wages given, a cultivator must not only come to them himself but must bring his whole family, for what he earns is only sufficient for his own bare subsistence. On the ordinary works in progress, he may earn enough to support himself and those of his family whom he should leave at home to look after his cattle and any small amount of cultivation which may remain to him; and as long as the distress appears only to be of a temporary character and confined to certain portions of the district, the best mode of relief is to keep only the ordinary public works open and aid the cattle owner, if necessary, by giving small advances to keep his cattle alive; for if they die or the owner is compelled to sell them, the said owner becomes a beggar and a loafer on the works, and in the end Government is the loser. Once let a man lose his cattle, and there is, owing to the poverty of the district, no hope for him. I would at every risk keep the cultivating classes to their own legitimate work in this district as long as possible. I have discussed this question over and over again with the zemindars of this district, and their universal opinion is that when once a man gets accustomed to road work, he in many cases prefers it to field labour, and cultivation suffers.

With regard to tests I have had no experience. I would only open special works when the distress has reached such a height that the ordinary public works cannot supply sufficient work.

The experience of 1868–69 leads me to advocate the collecting of applicants for work in large numbers at a few localities; I found then that where employment was given to smaller bodies scattered over the district, the work was scamped, the people not properly paid, and money wasted. On the large works, though the said works were miserable failures as regards utility, the people were under the supervision of the civil officers, sufficiently paid and well cared for.

Such large works as I advocate should, in my opinion, be placed under the Public Works Department officers for work; but the civil officers should also exercise a general supervision.

Mr. Gardner.—Whether ordinary works in progress will afford relief depends on their character. Earthwork alone seems fitted for relief operations. The only works usually in progress are ordinary repairs of unmetalled roads. The sum allotted for these is very small, and the work is usually completed during the month of November. In most districts, however, there are unmetalled roads which require raising and improving, and the work is eminently suited for relief purposes. The same remarks apply to deepening of tanks. Abundance of works have been already selected and approved; all now necessary is the sanction and the money.

The system should be the same as at present. All large works should be under the personal charge of officers of the Public Works Department; minor works might be placed under the tahsildars (native sub-collectors) under the same restrictions as at present.

The great thing is to begin relief works at the right time, and to persevere in them. If relief works begin too late, the people get into a low state of apathy, in which they are unable and unwilling to travel from their homes, and unfit for and unwilling to work; they should be kept going long enough for people of the neighbourhood to be aware that work is to be got on them; if they are opened for a few days and then closed again they do no good, and when re-opened the people do not believe in them. At relief works I would have no tests at all as to fitness of applicants. All persons willing to work, and fit to work, should be admitted. If relief works have been taken in hand in time, few persons will have become debilitated or unfit for work.

Relief works at great distance from men's homes will attract only those classes which are in the habit of looking abroad for work; in this district the *Nunia* or "navvy" clan. If the work is to help the ordinary labouring classes, it must be opened nearer to the people's homes.

Mr. Daniell.—Where the ordinary district works are suitable to relief purposes they should be utilized as far as possible for relief. The tests must differ according to the state of pressure, the time of pressure at which works are set going to aid in relief, and the condition of the people. Special works would be open on failure of ordinary works to meet the necessities of the case. Arrangements must differ so much according to the numbers who attend the works. For large numbers, works should be, as much as possible, kept distinct; (1) for able bodies who can do a good task for their wages, and who will leave the work whenever their usual labour is in demand; (2) for inefficients who should be placed on lighter work, supported by relief camps, and by means to have medical supervision, and who would cling longer to the works than their stronger brethren. The class (1) would be particularly under Public Works Department; the class (2) would be ordinarily under Public Works Department. The civil and medical officers would, however, have a voice in the amount of work and general treatment of class (2).

So long as the classes are kept separate there is no objection to concentration of labourers. Petty scattered works are objectionable, except perhaps to meet an exigency to last over only for a very short space of time.

Colonel Fisher.—If I thought distress only temporary, or I was not satisfied that it was indicative of approaching famine, I should, having ascertained the area affected by scarcity, throw all the Public Works Department assignments for repairs, maintenance, &c., for the year into that area. If this did not suffice I should give the people (as elsewhere suggested) *takávi* advances on the security of *malguzars*, and make the people understand that the labour of each receiver of a takávi advance was hypothecated to me to the extent of that advance, and that I would allow each village patti, or pargana (they being collectively responsible) to work off the obligation undertaken as soon as my projects had received Government sanction. I would have no tests for applicants for relief; indeed, they would not be required under the system proposed, and tests are always more theoretical than practical, and are liable to much abuse with native agency. I do not approve of "special works;" they have the disadvantage of being constructed for a special purpose, and a tendency to be very useless, once that purpose (which was often only a temporary one) has been effected. In fact they are generally productive of wasteful expenditure, are seldom of permanent benefit to a district, are always prepared in the hurry and excitement of a pending crisis, and are practically past recall before the experience which famine gives has been gained. Under the system I propose special works would not be sanctioned at all, but fully matured projects after the strain of providing food for the people was over, and when all defects in lines of communication had been fully disclosed. If special works are to continue, then I consider the supervision of the labour and preparation of daily labour rolls should alone be entrusted to the Public Works Department; the payments to the people should invariably be made by the civil authorities. I speak with the greatest confidence on this point, as I tried it last cold weather with the most marked success. The Public Works Department overseers are thus removed from the temptation of entering paper men on their rolls, and there being no profit to be made in that way, they exact a much larger proportion of work. Of course no civil officer under the rank of a tahsildar should be employed in distribution of wages to the labourers. In Garhwál the district officer is also the assistant engineer, and the responsibility rests on him for seeing that all needful steps are taken by all branches of the public service. Under the system I advocate the selection of works on which takávi advances are due would be made after, and not before, the famine had taught us which were the works likely to be most useful or remunerative.

Colonel J. Reid.—The distance test is very necessary. Our rates of subsistence wages even are higher than would be given for ordinary field work in their villages; and when people can get work from us near their homes they very naturally prefer the more highly-paid Government employment. At this moment we find that very many persons go to their homes when ordered to a work at some distance from them, and in some cases at least we find that workpeople from localities in which distress is known to be exceptionally severe make no objection to a move. The general inference to be drawn is, that those who go away do not require—anyhow do not urgently require—Government aid, and that those who remain really are in want of assistance. As to the nature of works to be undertaken, this must depend upon circumstances; here there is no scope for large works, and we must take what we can get. The impression I formed when our relief works were first started was that some of the subordinates of the Department Public Works were rather too rigorous in exacting tasks beyond the physical capacity of some of the workpeople, and with regard to others did not make sufficient allowance for the fact that people, even in good condition, employed on work to which they were quite unaccustomed, could not perform what would be a light task to a skilled labourer. I may be in error, but as a matter of fact persons undoubtedly in urgent need of assistance did leave the works because of the tasks exacted from them; in some instances large numbers did. I am inclined to think that in some instances details of the distribution of work were not sufficiently attended to, and that the small out-turn of work was caused partly by this defect in the arrangements. It might occasionally be found convenient to place small works inconveniently situated under civil supervision, but our civil officers are fully occupied with their legitimate duties; few of them have much experience of, or speciality for, such operations; and as a rule I have no doubt relief works should be placed under the Department Public Works, the Deputy Commissioner retaining control as with respect to ordinary local funds works, and being responsible for seeing that all needful steps were taken by all branches of the public service concerned.

Mr. Harington.—To apply the distance test in a bitter January in Oudh is next door to manslaughter. To omit it in the warmer months is to throw away a valuable means of eliminating those who have not yet reached the stage of real distress. With the *proviso* that an infirm gang is always kept up and considerately enlisted, and that the supervising officer exercises ordinary intelligence, honesty, and fairness, the task system cannot be too steadily insisted on for those who can do full work. It follows that when the distress is only partial, small local works in the immediate neighbourhood of the sufferers are necessary for the months of December and January. Large ones are clearly advisable for the warmer months.

During the rains the expediency of large works is counterbalanced by the great risk of cholera. On the other hand much rain should soon do away with the necessity of relief works.

Captain Currie.—Employ those willing to work on ordinary works in progress. The test should be a full day's work for a full day's pay, with fines for short work down to a bare subsistence allowance. Special works to be opened if ordinary works were found insufficient to employ all who came to work. Such works should be arranged so as to collect the applicants in large numbers at a few localities at some distance from the villages of those coming to work never in small works close to the applicant's villages such works could not be supervised properly, and would only compete with the local labour market. All works should be under the Public Works Department rules and Public Works Department supervision. The district officer in this district has his public works officer next room to him, so that there is no difficulty as to communication. The works should be chosen by the Deputy Commissioner in consultation with the Public Works officer. The whole responsibility for seeing all needful steps taken by all branches should rest with the Deputy Commissioner, who should be fettered as little as possible in his action, and who should report fully to commissioner of division.

Mr. Quinn.—The measures I adopted were to open poor-houses at each of the tahsíli towns. This secured the supervision of a tahsíldar and hospital assistant. Municipal works sanctioned in the budget were taken in hand, and additional works projected; the district engineer was instructed as a tentative measure to take on at a low wage all who applied for employment on a few selected district works. When it was found that people flocked to these works, notwithstanding the low wage, and that many came from a distance, a few regular relief works were opened. This system of only extending relief works as the necessity for them was proved, worked well. The class who apply for work; their physical condition; the proportion to the whole borne by men, women, and children; and the distance the applicants have come from, require to be all carefully watched. As long as it is possible, I prefer that the people should be given work within a reasonable distance of their homes, and have at least the option of returning to them at night. When famine increases in severity, large works must be set on foot, and this requires the assemblage of workmen in large bodies. To these works I should draft off the able-bodied men and women, under the inducement of a higher wage, leaving the weak and infirm, and those encumbered with families, to be employed on petty works near their homes; but as regards an absolute rule that all relief labourers are to be employed in large bodies and to be hutted, it should be borne in mind that huts are built for those who leave homes of their own; that the sick, the old, the infirm, and young children have all to be dragged to long distances from their homes, or else a special and expensive village organization has to be made for their maintenance and attendance, during the absence of their natural supporters, and that camps, if epidemics are to be guarded against, require special sanitary arrangements and medical supervision. I do not think it would be wise to incur all this expense, and to put the people to so much hardship, simply to secure a test that those relieved were really in want. The special works to be opened should be selected by the district officer in consultation with the district engineer. All relief works should be under the Public Works Department, and the head of the district should be generally responsible.

Mr. Blennerhasset.—If the district officer believes the distress to be only temporary, relief can be supplied by employing people on road repairs and similar ordinary works in progress, both district and municipal. The tests should be the ordinary ones, and the distance test should be applied if possible.

Special works should be opened if the ordinary works are insufficient to keep the people from starving. The special works should be as few as possible, so as to admit of good supervision, and not near the houses of the applicants.

A combination of public works and civil supervision appears preferable to handing the works over entirely to either department. The Public Works can enforce the labour test better than civil officers, and the civil officers are better qualified to see that no one in want is refused work. The Public Works officers in this province are already in close connection with district officers; the latter should select the works for relief, and the chief civil officer of the district should be responsible for all officers working at their respective duties.

Mr. Lumsden.—Before it is known whether incipient distress and dearth of employment will or will not merge into famine, all applicants for work should be employed on the ordinary local and municipal works which may be in hand. Contract work should be put a stop to on all such works for the time being (I refer to works suitable for the employment of unskilled labour), and special arrangements made for carrying on these works by the people who come forward and ask employment at subsistence rates.

At this stage I would not apply any special test for admission; task-work should, however, be rigorously exacted, the wage kept down to mere subsistence rates, and the applicants for work should be required to provide their own tools, baskets, &c.

When the number of applicants for admission on these works become excessive and the symptoms of distress increase, special works previously selected as suitable and held ready for the occasion should be opened.

While the numbers, though beyond what could be employed with advantage on the ordinary works in hand in the district, are still manageable on minor suitable works specially selected, and there is any hope that the pressure and distress are of a temporary nature, and will shortly either disappear or at least greatly diminish, I am decidedly of opinion that it is more politic to employ comparatively small bodies of people at a number of works in the distressed regions than to concentrate large bodies at one or two heavy works.

While there is any reasonable hope that the pressure will pass away, it seems to me very bad policy to require the applicants for employment to leave their homes and move away to distant works. A native is usually averse to leaving his house or village, and his readiness to do so in order to obtain employment on subsistence wages at a distance under task-work rules, is most certainly one of the best tests we have of the reality and severity of the pressure; and it must be remembered that at what may be called the *slack* season even in ordinary years there are a large body of people who would flock to works opened near their houses at our subsistence rates of wage; but bearing all this in mind, it must not be forgotten that it is those natives who once leave their homes and take to our large works, bringing their little all with them, that become the "*habituals*" on our relief works, whom it is so hard to get rid of even when the times improve.

It is objectionable, therefore, in my opinion, to make *any of the classes* who come on our works leave their homes at this initial stage, while there is hope of the distress proving temporary, and the number of applicants are still, with reference to what they will be should the pressure continue, comparatively few; and it is specially objectionable to make any of the actual cultivators of the land, a few of the poorer among whom will generally be found to require assistance, move away to works at any great distance from their villages, for while there is any hope that the pressure will shortly diminish, or that any change in the weather might afford the cultivator profitable employment in his fields, it is manifestly advisable, if possible, to provide *him* with work within a moderate distance of his village.

As soon, however, as the numbers increase to such an extent that it is difficult to provide suitable employment for them on small works of the description

CH. II. QN. 6
NORTH-WESTERN PROVINCES AND OUDH

alluded to, or to provide the necessary establishment for supervision and management of a large number of such works scattered over a district, and particularly when it is almost certain that the distress is on the increase and must last for some time, say until the next harvest is reaped, it then becomes expedient to concentrate the people on large works at a distance from their houses, providing for each work a suitable staff of Public Works Department and civil officers. Concentration will at this stage be a decided advantage: it will keep many off the works who would come on them were they within easy reach of their homes, and it will be more practicable for the Public Works and civil officers to make the necessary arrangements for supervision, management, payment, and the procuring of supplies, when the large body of labourers they will at this stage have to deal with are concentrated at one or two centres.

As regards relief works being under Public Works officers or civil supervision, I am decidedly of opinion that as soon as *special* relief works are undertaken they should be under the supervision of officers of the Public Works Department.

BENGAL.

BENGAL.

Mr. Barlow.—The usual practice, which appears to be the right one, is to push on ordinary district works of all kinds and under all departments. These works are tentative. No particular tests are applied. All applicants are admitted at the ordinary wages of the district. If these works draw an unusual number of people, and the condition of those who come is bad; in short, if the reality and extent of distress becomes marked, then the next step is to open what are called relief works in places where, probably in respect of the most serious failure of the crops, distress is severe, and which are beyond the reach of the aid afforded by other works. The question of whether such relief works should be few or many, and how they should be arranged according to locality, must of course, depend upon the degree of distress; but it seems to me to be already decided that a restricted system should, as far as possible, be followed, by the consideration which we have in view, that the distress is supposed to be temporary. I think that it is only when distress approaches, and is manifestly progressing into famine, that considerations of economy and security against abuses can afford to be disregarded, and as a matter of convenience to the people themselves, work can be arranged so as to be available at every man's door. In the case before us, work might be provided at a few convenient centres, so that willingness to go some distance from home to obtain employment might be used as a test of the necessity of the people frequenting the works. Under the present system in Bengal, where the duties of the officers of the Public Works Department are confined to provincial matters, the question as to any choice between departmental and civil supervision for these works could hardly arise very early; unless the distress had passed rapidly beyond the management of the local authorities, and Government had stepped in with special measures and organization. In ordinary cases intervention of the kind would not occur until famine was deemed to be approaching. Wherever and whenever possible, however, I prefer the conduct of works by the Public Works Department under an energetic European officer constantly upon the spot; because I believe a better return for the money spent is obtained. Under civil supervision, such as it is, there is great waste of money. The chief argument in favour of civil works is that the Public Works Department cannot deal with people deteriorated and wasted in physique; this should not apply in the case of distress believed to be temporary. The district officer must certainly be the person upon whom the responsibility rests in the district, for seeing that all needful steps are taken by all branches of the public service concerned. This fact, as far as my experience goes, has already been so far acknowledged that no want of accord or friction between Public Works Department officers and district officers, has been practically felt in carrying out relief works together. Certain relaxations of departmental rules are allowed under the necessities of the case, and after the outline of the system for working to be followed, and the responsibility attaching to both sides, has been laid down by Government, the common superior, it is found to answer. One thing only is essential, and I believe has been observed. It should anyhow be provided for by a strict rule in any famine code. If anything special and unforeseen occurs or has to be provided for, the officers of the Public Works Department after consultation with the chief civil officer, must accept his decision, pending orders of Government. This is necessary to guard against a deadlock.

Mr. Worsley.—When a district officer believes distress to be temporary, he should afford every opportunity to applicants for employment on the ordinary works in progress *at the ordinary rates.* If the applicants become so numerous that these works cannot receive them, the district officer should open special works in different localities at the ordinary rates. The only test of admission should be willingness to work at the ordinary rates. The works should be under civil supervision, and should consist of thorough repairs to existing roads. They should be opened in such a manner that any villagers might obtain employment within three or four miles of their houses. It is in my opinion a great mistake, except in time of severe famine, to open works close to the people's houses. If, for instance, I had reason to believe that the whole length of country between Seetamurhee and Mozufferpore was in a state of distress throughout an average breadth of six or eight miles, I should consider it sufficient to offer employment along the whole length of the Mozufferpore Seetamurhee road in the first instance. The villagers who happened to live near the road would of course have an advantage over others; but the advantage would arise from accident, not design. I have had very little experience of the Public Works Department in time of famine. A few small works were under the Executive Engineer, Mr. A. Urquhart, in Mozufferpore Sub-division in 1874, and others were under another Department Public Works officer in Tajpore Sub-division; but the systems under which civil officers and Department Public Works officers employed labourers differed more in name than in practice. Relief works should be selected by the district officer, who should be held responsible for taking all needful steps.

Mr. Magrath.—To my mind the work should be special under special Public Works staff. It should not be brought near the people's homes or made easy for them. I do not think any test is necessary when men are properly supervised and bare subsistence is given as wages.

I have already said that I considered it in every way undesirable to mix up famine relief works with other works. They should be arranged so that the work may come to be permanently useful, and under skilled supervision of officers of the Public Works properly appointed and in sufficient numbers. They should not be taken to people's homes, and should employ as many people as is convenient for the staff to supervise. If many works are carried on, skilled supervision becomes very expensive, and people are led to wander about and see where the work is lightest. Besides this, if the people are near their homes, facilities are given to them to shirk their work and only come to be counted, or at least to idle at home if the officer in charge is absent at any time. The cry of demoralization and a tendency to pauperize the people raised in 1874, with regard to the large works, was utterly disproved. The people returned to their fields from the large works as soon as the cultivation of the crops came on, but tried to keep up the small local works to spend any leisure time they might have. I think I may safely say that the experience of all sub-divisional officers was against small local works as giving opportunities for idleness, peculation, and scamped work that did not exist where the larger works were properly officered.

I cannot conceive how there can be any doubt about the employment of Public Works officers for the purpose. The work is such as they alone are technically acquainted with, and they alone can supervise efficiently. The Public Works officers should be responsible that the work given to them to do is efficiently done. The picking out what works should be done would rest with the local authorities. If the Public Works officers are of opinion that they can only efficiently employ a certain number of people on a particular work, they should acquaint the local authorities, who would fix upon such other works as may be necessary. No responsibility should rest on the Public Works officials, except seeing that the work is properly done and the labourers regularly paid. All other matters should be the work of the local authorities. No difficulty was found in 1874 in their working together. In picking out works those should invariably be selected which have already been properly planned, and, if possible, sanctioned by Government.

Mr. Hodgkinson.—If the distress is likely only to be temporary, it is possible that employment may be found for those requiring it in the ordinary works in progress under the Road Cess Committee or municipalities on the usual wages at first. The opening of special works indicates a greater degree of pressure, and consequently a lower calibre and morale in the applicants for relief; then other tests must be employed. What tests are best will be discussed later on in dealing with chapter III. Special works should, as a rule, only be opened when it is found that the administration of the ordinary local funds is not likely to afford work on a sufficiently extensive scale for the requirements of the people.

In a district where for agricultural purposes labour is being constantly wanted, it is very much better that the works should be small and numerous, so as to keep the people near their houses to resume their ordinary occupations as opportunities offer. The difficulty, of course, is to have efficient supervision in Sarun. The different indigo planters have afforded material help to Government officials in this respect. In the earlier stages of the distress I should certainly prefer scattered works, if there was a reasonable prospect of the distress being only temporary and not resulting in a real famine. If, however, a real famine appeared imminent, the large sums of money necessary to meet it could not be advantageously and economically spent on small works, and the difficulty of supervision would be much enhanced. A canal, a railroad, or some such large work should be commenced, which would have the advantage of concentrating the workpeople along a long line of relief, and be of material use in averting or coping with future famines. From the nature of the work it would be placed under Public Works officers, but the officers in charge of it should be required to submit to the district officer periodical reports of the numbers and conditions of the labourers, and of the progress of the work, along with indents for the grain, &c., required for the purposes of payment. The district magistrate will be generally responsible for the administration of district in relief matters, except in cases where it may be expedient to divide the district and appoint a special officer for the purpose of famine administration.

Mr. Toynbee.—If the distress seemed likely to be only temporary, the ordinary works carried on by the district engineer from Road Cess Funds would probably suffice. If it seemed to the district officer that something more than these should be undertaken, he would arrange with the district engineer to open some special work suited to the circumstances of the case, taking especial care that such work should be of real and lasting benefit to the district, and not the mere throwing up of earthwork where it was not required.

If distress appeared likely to turn into famine, it would then be necessary to ask for aid from provincial or Imperial funds, and to commence some great and lasting work, the plans, &c., of which would presumably be ready beforehand. In the last-named case the Public Works Department would have the supervision of the work; in the two former the civil authorities, advised by the district engineer.

In all these cases it would be advisable, for the sake of better supervision, to hut the labourers on the works. When first opened, the work being task-work, all comers would be employed at ordinary rates. No test would be requisite. Special works should be arranged, not with the main object of suiting the comfort and convenience of the people, but to ensure the expenditure of money on a lasting and permanently beneficial work. Such a work, once begun, should not be left to be completed when another scarcity occurs; but should, so far as is possible, be made useful and remunerative at once. The primary responsibility for all measures of relief within the district should rest on the district officer; but he should have extra aid and establishments allowed him, so that his ordinary work might not suffer by the pressure. He should, if matters assume a more serious aspect, be set entirely free from ordinary routine work, and the help given him in the way of an extra staff would better be employed in ordinary work—those officers who had been longest in, and had gained most experience of, the district being set free for famine work. His right-hand man, as regards works, would be the district engineer. For the supervision of charitable and other forms of relief he would require active and experienced native deputy collectors or others.

Mr. Finucane.—The winter rice crop of 1875 was seriously deficient in a belt running along the Nepal frontier and extending through the Soopool, Madhubani, and Sitamarhi sub-divisions. The failure was most marked in the northern half of Alapur, where such competent authorities as Messrs. Geddes and MacDonnell described the rice crop as an out-and-out failure. In the southern half of the pergunnah the crop was probably an eight-anna one. The part of the pergunnah where the crop was most seriously deficient included an area of somewhat less than 100 square miles, with a population of 30 to 40 thousand persons. The only measures of relief which it was found necessary to adopt were—

1st. Distribution of gratuitous relief to old and infirm persons.

2nd. The expansion of ordinary road works in progress under the Raj engineer.

3rd. The stopping of rent realizations.

4th. Small advances for seed grain.

All applicants for employment were admitted on the road works and were paid at ordinary contract rates, which in this tract were so very low that an ordinary labourer could not earn more than 1½ to 2 annas a day. Light labour gangs were also formed on these road works; women and children and weakly persons were admitted to these gangs, and paid a daily wage of from four to six pice. The works were carried on by the Raj assistant engineer at contract rates and under the ordinary departmental rules. As civil officer on the spot primarily responsible, my duty as regards these works consisted in seeing that the labourers were regularly and fairly paid; that all comers were admitted; and also in deciding whether particular individuals were sufficiently strong to be put on piece works, or whether they should be admitted to light labour gangs. In addition to relief by employment given on road works carried on by the Raj engineer at the expense of the Durbhunga estate, employment was also given on tanks, of which large numbers were made by jeyt ryots (village headmen) at their own expense, or from sums advanced by way of loan, which sums have been since repaid.

Mr. Mackie.—If the district officer believes distress will be but temporary, he should employ applicants on ordinary works just as in an ordinary year. If the applicants, however, largely exceed the numbers the works can accommodate, he should open a few special works in detached localities where rigorous task-work will be enforced, and so situated that the majority of workers will necessarily have some distance to travel before they obtain employment. These should be of such a nature that they do not commit Government to a very large expenditure, and yet they should not be so numerous and widely scattered as to render close supervision by the ordinary establishments a matter of difficulty. I would place all works, so far as regards professional details and payment, under skilled supervision, leaving their selection to the revenue officers. I would place no restriction on the admission of applicants.

Mr. Kirkwood.—Even when only a one-third failure is assured over any considerable area, if there are no works in progress, arrangements should be made for opening works whenever a demand for employment may arise. This should be done even before the harvesting of the crop. These works should be conducted on the same principles as ordinary works. Where there are local works in progress under any of the public departments which employ labour, applicants should be sent to them. When the failure assured is greater the works will have to be more numerous. In the first months of distress, works should be opened in a comparatively few localities in the distressed parts. These should be large and important works. Directly distress appears to be deepening by unusual numbers flocking to these works, some of whom come from some distance, or are not ordinary earthworkers, works should be multiplied throughout the distressed region. When the distress shows itself to be of such a nature as would amount in many instances to starvation, if it were not for Government intervention, works should be opened to such an extent that every large village should have some work available within a distance of (say) four miles. For this purpose long works, such as roads or canals traversing the distressed tracts, are much better than tanks or reservoirs. Work should be simultaneously commenced at several places throughout the length of a road or canal, such places being about six miles apart, and the villagers going to the gang nearest their village. All these works should be under the Public Works officers, and every sort of human being should be admitted to them, the only condition being that for so much work he or she gets so much pay. The rate of remuneration should be raised with the increased price of grain. When prices approach double ordinary rates, the pay rate on these Public Works Department works should be somewhat raised. When prices are nearly two and a half times their ordinary figure, the rate of remuneration should be 25 per cent. in excess of the ordinary rate; the difference being left for the labourers to make up by increased work, economy, and abstemiousness. When the price of food is about trebled, the rate of pay should be increased by 33 per cent., and when quadrupled, or nearly quadrupled, by 50 per cent.

At the same time, when still increasing numbers applying for work, many of those persons not being ordinarily engaged in that capacity, and the price of food rising to nearly three times its ordinary rate, show that distress must be getting severe, separate works should be opened in the vicinity of every village for light labourers. These light labour gangs should be under the control of civil officers. They should not be at work within two miles of the other gangs, but, with that reservation, they may well be employed on the same sort of earthwork as the other gangs; accuracy of slopes and dressing and turfing being, when desirable, left to the subsequent attention of the regular departmental officers. Into these gangs no man or boy above 12 years of age should be admitted unless his physical appearance plead for him; from them no woman (except a few professional earthworkers) or child should be excluded. Task-work should be strictly exacted. The rate paid should be about 50 per cent. in excess of the rate paid at the same time on the Public Works Department works; but, in all other respects, these light labour works should be carried on upon the same principle of "no work, no pay." Of course such women and children as may desire to do so could go with their male relatives on to the Public Works Department works and work at Public Works Department rates. The two classes of work may, with perfect propriety, be going on at the same time, not only without interference, but with mutual advantage. These weak-body gangs should be under civil officers, because they are more likely to be free from rigid departmental doctrines, and to remember that the very essence of the object of the works which they are supervising is the saving of the lives of those who are feeble or unaccustomed to earthwork. To that idea must be subordinated excellence of work and economy of construction, both of which objects should nevertheless stand well forward in the mind of the supervising official. To encourage into energy the listlessness of incipient starvation, and while that encouragement is going on, to dole out some small extra reward to the struggling new comer, will have a large call on the attention of the supervising officer. When anyone first joins a relief work in anything approaching an emaciated state, he or she should generally be given food or money sufficient for a few days support; during this interval some little work is done, something is earned, and strength is gained; with these earnings the earnings of the next week are supplemented, and by that time probably the recipient will be in a position to earn enough for self-support. Sir George Campbell in his evidence before the Indian Works Parliamentary Committee has recently expressed a weighty opinion against the universal application of task-work in famines. He thought that, when the people were emaciated, any such test would lead to the people refusing work; for it would be impossible to distinguish between what work one man could do and what another. I would venture to say that such discrimination is possible to such an extent as I have above noted, and that that is all the discrimination required. The experience of two famines has taught me this; and where than in Orissa could emaciation have been greater? Under such a system as the above, which was worked successfullyin those two famines, I believe that no one who can work will refuse to do so. Very many in want cannot, owing to physical or caste inability, come on to earthworks; some, as mothers with children at their breasts, it is not wise to ask to come; but all others will readily come. For the residuum work of a suitable nature like spinning and weaving must be provided, or relief must be given gratuitously.

For all works and all branches of the public service during times of famine the collector of the district should be responsible. This should continue to be the case even though he is provided with the aid of a civilian co-adjutor of ample experience to take charge of the famine department of his district cares. Differences of opinion between that co-adjutor and any other department should be referred to the collector. The Public Works Department works would be subordinate to the control of the collector,

I. II. Qn. 6.

BENGAL.

as to the localities where they are to be opened, the rates to be paid upon them, the persons to be admitted to them, and the frequency and manner of payment. Any important differences of opinion with other departments in his district or with his co-adjutor, of which the collector cannot himself satisfactorily dispose, should be referred by him to the commissioner under whom he may be. To each much distressed district there should be attached at least one officer of the standing of an executive engineer, who would take the instructions of the collector, and be responsible to him for the conduct of the Public Works Department works in the district in every respect, except professional correctness and excellence and the control of accounts. On those points the executive engineer should be responsible to his superior departmental officers.

Anything in the shape of a distance or poverty test before admission to the works appears to me opposed to both humanity and economy. I regard a distance test as an invention which is pernicious in every way. If people have to return to their homes, it wastes valuable time which might be expended in earning money. If they do not return to their homes, it exposes them to nights of damp and cold, an exposure which works ruinously on enfeebled frames (*vide* Sir George Couper's opinion on the North-West Provinces mortality of last winter). Many will refuse thus to emigrate from their homes, and will prefer to face death at home, together with their female relatives, to leaving their women and children desolate and helpless, and to wandering forth themselves to face unknown ills in an unknown country on unknown work among unknown people. The evil of the women and children accompanying the males of their families in this emigration movement is hardly less. Without a home to sleep in the women, if they survive, rapidly degenerate morally, and the children often fail to stand the exposure. The cost of hutting is great, the home falls into ruins, the odds and ends by which, at home, even in the worst times, life is to some extent supported have no existence. As for driving persons possessed of any property or in good physical plight from the earthworks, it seems to me a plan deserving of nothing but condemnation. I venture to regard the introduction of that plan as a serious error in the administration of the recent famine in Bombay and Madras. It seems to have been regarded as a subject for regret rather than for deep congratulation that so many were early in the year flocking on to the works in search of employment, instead of wasting away and dying slow deaths at home after parting with the remainder of their little all. Let but task-work be insisted on, and one has an unrivalled test of want. It seems to me to be much more economical to have these people in January in good plight on the works than to drive them off then to return, if still alive, two or three months afterwards with emaciated frames. They will themselves then be able to do but little work, and they will have left at home a starving wife and children, who must then be relieved gratuitously in whole or part, but who would have eked out existence till better times on the small family belongings, had the male members of the family not been driven home to help them to consume all their possessions in enforced idleness. I think there is scarcely room for doubt that a grievous degree of avoidable distress, and perhaps mortality, must be laid at the door of such a measure as this, whenever it is essayed.

Mr. Brookes. — The early applicants for work should be referred to the ordinary public works in progress. Municipalities and the Road Cess Department should be able to meet the demand when only temporary distress was occurring.

The labour test would be the best, as least likely to disorganize the arrangement of the works in progress.

Special works would only become necessary when the local fund works did not provide sufficient employment.

Small special works, not requiring the supervision of trained officers, could well be undertaken by the civil officers, assisted by non-official persons; or the district officer might have the services of an assistant engineer placed at his disposal to assist him in his arrangements for work, and the best method of carrying it out.

More important special works.—These, if arranged in too convenient proximity to the homes of the distressed, generally draw persons who are not in urgent need of relief.

It is better to arrange for comparatively large numbers in fewer localities. The labour is then more manageable; more useful work can be undertaken in this way, and with less cost for supervision.

Undoubtedly such works should be placed under the Public Works Department, where trained officers and subordinates could see to the work being properly carried out and without unnecessary expenditure.

Civil officers are placed at a great disadvantage when entrusted with such work, and although they may often be amateur engineers themselves, they cannot convert the temporary subordinates they entertain for the occasion into men of experience and ability, so that the work soon gets into confusion and all check is lost.

BOMBAY.

BOMBAY.

Mr. Hewlett.—I think that when it is clear that on account of the failure of rain there will be a scarcity of food grains, and when the price of grain has risen so that only 24 lbs. or 26 lbs. of grain can be purchased in the villages for a rupee, and if the market shows a tendency still further to rise, then the sooner relief works are opened the better. I am certain that by taking this action in the commencement of the late famine the Government has saved thousands of lives, for by it the people were prevented from sinking into such a reduced condition that aid, had it been longer delayed, would have been of no good to them. I also think that this action is the most economical to Government in the long run, as the people would then have some little stock of money which would supplement the Government rates and prevent the large majority of them requiring special treatment. I think that when it is determined to open works, all such should be under the officers of the Public Works Department. The organization under them, as far as my experience goes, is more effective, and the medical supervision becomes much easier by concentrating large bodies of men on works of permanent utility. In certain cases it may be desirable to have road works or the clearing of small tanks under civil officers, but I believe that the civil officers would be more usefully employed in inspecting villages, in drafting men and women requiring State aid found in them to large works than in supervising road making.

By this means you have all the people of a district under one management. Of course there can be one or as many more works in a district as occasion demands, but I am certain that for effective administration this plan, if adopted, would be found easier and more economical.

During the late famine the utmost difficulty was felt by the medical department in meeting the demand for medical subordinates, and the strain on it was excessive, but by concentration of large bodies in suitable camps, and I beg by this to carefully guard myself from any imputation of wishing to overcrowd camps, a more efficient supervision could be kept by the officer in charge over the labourers, whilst the medical subordinates would be able to devote them-

Ch. II. Qn. 6

Bombay.

selves to the treatment of the sick, the elimination of weakly and reduced persons from the different gangs by frequent inspections, the separation into classes of those who require special treatment, and the general superintendence of the relief houses and kitchens. I should gladly have recommended for sanitary reasons that the weakly gangs should have been kept in villages and employed in village sanitation under civil officers, and in fact I did recommend this course at one time during the late famine, but it was pointed out it would demoralize the people, that efficient supervision would be impracticable, and that it would be impossible to prevent fraud, and in these conclusions I am obliged to concur.

Mr. Hart.—As regards temporary distress measures, my opinion is that at first the ordinary works in progress should be used for relief purposes, but provision should at once be made for special works under trained organization, for which large public (especially irrigation) works under professional supervision are best suited. On these large centres all relief labour should be concentrated as soon as all hope of averting famine is at an end.

However, till famine has completely declared itself, and while there is hope of agricultural operations being resuscitated by rainfall, local works are the more suitable as tending to keep the agricultural labourers on the spot, so as to take immediate advantage of any opportunity that might offer of obtaining a crop.

The arguments in favour of opening large works under Public Works officers are that such officers are professionally trained to the management of large bodies of labourers, and that on large works, engineering skill and technical knowledge will be required to conduct such works with economy and success.

Public Works officers may best be placed in direct communication with local civil officers by the heads of their departments, and the working of the whole should be supervised and controlled by a special officer in direct communication with the Government.

The responsibility of all operations should rest with the revenue commissioners and the chief or superintending engineer.

The selection of works should be on the principle of convenience, concentration and permanence of the employment likely to be afforded; in addition, of course, the elements of facility for shelter, healthiness of locality, and suitability of water supply must enter largely into the consideration.

Colonel Jenkin Jones.—The collector should request the executive engineers of the general and irrigation branches to provide employment for distressed persons on the public works in progress; and if necessary to start some new works for the special purpose.

Applicants should at first be employed on the ordinary works in progress, the able-bodied persons under the Public Works officers and the weaker ones under the local officers. The assistance of the municipalities should also be asked for.

As to test for admission, the civil officers of the district should make careful inquiries through the village headmen, as to the condition of the applicants for relief.

Special works should be opened when the ordinary works in progress are not likely to afford sufficient employment for the distressed persons.

It is preferable to employ the able-bodied people in large numbers at a few localities, the weaker people only being provided with work in smaller bodies in the neighbourhood of their homes.

As far as possible all relief works should be under the Public Works Department. Only petty works, such as the clearance of small village tanks, clearing tracks, and cutting prickly pear, &c., being left to the civil officers.

The officers and subordinates of the Public Works Department are from the nature of their ordinary duties better fitted to organize and overlook the labourers than the district officers.

The Public Works officers should consult with the Revenue officers as to the selection of new works to be started, the supply of food, and the applicants for relief.

Responsibility should be divided between the collector and the executive engineers, the former to ask for what is required in the shape of relief works, and the latter to carry them out.

Mr. Spry.—The district officer, supposing the distress to be only temporary, might first employ all applicants on such ordinary works in progress as required only unskilled labour. Should these works not appear sufficient, he might re-appropriate to similar works all grants entered in the sanctioned budgets for works requiring skilled labour, or which are otherwise unsuitable. On all such works both distance and task tests should be strictly enforced, also none should be admitted unless they brought certificates from the *taluka* or village authorities that they really require work. Special works should not be opened till it appeared that the works above enumerated were unequal to the demand, and the special works should be centralized as much as possible. A number of small works scattered about are difficult to supervise, and only demoralize. I am in favour of works being under the Public Works Department alone, as my experience shows me that civil agency fails after a very moderate limit. The civil officers have neither the knowledge nor competent establishments to deal with civil agency works, consequently a maximum of expenditure with a minimum of results ensues. The Public Works Department, on the other hand, know what work should be done, how it should be done, and whether it is properly done. The Public Works Department officers also have greater experience in enforcing discipline amongst the people on works. Besides this, in times of distress civil officers have many other important subjects to look to which are quite sufficient to absorb their time. As in general and important matters there is direct communication between the collector and executive engineer of the district, so in all matters of routine and in petty matters there should be direct communication between the civil officers in charge of talukas and the assistant engineer in charge of works situated in those talukas. But to prevent misunderstanding and clashing, there should be rules framed, suitable to the circumstances of the case, distinctly defining the province of each. Nothing is so likely to cause disaster as want of unanimity between officers of the respective departments.

The Public Works officers, in selecting works for relief, must to a great extent be guided by the civil officers, who are the best judges of the requirements of the district. On the collector, subject of course to the control of the commissioner, should rest the main responsibility.

Mr. Charles.—In organizing special works there can be no doubt that there should be always two classes of works dependent on each other, viz.: a civil work for the weak, and a Public Works Department work to which the civil labourers should be regularly sent as soon as they have regained strength.

To prevent confusion, the civil officer should have the final power of settling on which work a labourer should be.

The collector is undoubtedly the person on whom the responsibility should rest of seeing that the needful steps are taken by all branches of the public service.

Mr. Percival.—A very small pressure may be met by arrangements on the ordinary works under the Public Works Department and Local Fund Establishment; but as soon as it is certain that great numbers must be employed, large works under the Public Works Department should be opened. They should

H. II. Qs. 6.

BOMBAY.

provide work for large numbers at a few localities, otherwise the tests cannot be applied. Civil supervision in this district has neither means nor knowledge to control large works. The responsibility that sufficient works are provided rests with the collector, who must keep Government informed of what is required. The Public Works officers in charge of works must receive all persons sent by the collector, who is the judge to decide if a person is to be required to work or not. It is not unnatural that officers in charge of works should dislike having to take on people who cannot do a fair day's work, but if the collector sends people of feeble physique, the engineer must employ them according to their strength.

Mr. Propert.—Until the extent of severity, probable duration of the famine or scarcity has been as far as possible ascertained, all applicants should be employed on the ordinary works in progress as far as accommodation is available; if such works become crowded, special small works should be opened under civil supervision, the rate of pay on which should be fixed at the lowest possible figure consistent with the preservation of life. The acceptance of these very low rates of pay precludes, in my opinion, the necessity for applying a further test.

I have in the last answer described the circumstances under which *small* special works should be started. The opening of large special works must depend upon the demand for employment at low or famine rates of pay.

It has I think been clearly demonstrated during the late famine that all able-bodied labourers should be gathered together and employed on a few large works under the supervision of the Public Works Department, and that as far as possible they should work according to the ordinary rules of the Department.

The Public Works officers in charge of *famine* works should act in communication with the collector exactly in the same manner as the district executive engineer does with the district officers in *ordinary times.* Special works in times of famine do not, I think, require any departure from ordinary departmental rules.

It is to be hoped that from the present time works will be selected in every district for execution in times of famine or scarcity. There will then be no indecent hurry or confusion when the evil hour arrives.

The *general* responsibility on account of all remedial measures to be adopted must devolve upon the chief civil officer, *i.e.*, the collector. After full instructions have been received by members of departments, the departmental head must see that the officers immediately under his direction perform the duties assigned to them.

Mr. Norman.—In case of temporary distress, it is not, as a rule, necessary to open special works. All ordinary works should, as far as possible, be commenced, which should be carried out on a system of task work. If the distress increases, it may be necessary to attach famine gangs to these works, where those who are too emaciated to do a day's labour would receive a bare subsistence allowance. A hospital should be attached to each large work, where cases of sickness can be attended to. It may also be necessary to open a small relief list in order to feed the cripples whose relations are on the works. All works should be under Public Works agency.

When it becomes necessary to open special works, which will be the case as soon as the ordinary works are overcrowded, such works should be as large as possible, and should be started in well selected localities in different parts of the distressed area. Applicants for relief should not be employed near their homes.

All such works should be placed under the Public Works Department, because the officers of that department are best able to supervise large gangs, and because under professional superintendence the works are better carried out and less money is wasted. Civil officers, from want of training, are not fitted for supervising large public works. The executive engineers should, in communication with the collectors, select the works best adapted for relief, and they again would act under the immediate orders of their superiors, the commissioners and the superintending engineers. The responsibility of representing what measures are needful for the relief of distress must, in the first instance, rest on the collectors. The orders for the necessary works can only be issued by Government.

Mr. Moore.—I should arrange for sending applicants for relief on to the ordinary works in progress.

Applicants for relief should apply to the *Mamlatdár*, subordinate judge, sub-registrar, and chief constable, or other officer appointed for the purpose, who after satisfying himself that the applicant really is in want, should give him or her a pass on to some work.

If the ordinary works in progress are insufficient to meet the pressure, I would open a large special work; this is the best kind of relief, as it is not demoralizing.

The special works should be arranged at convenient centres, so as to collect comparatively large numbers in a few localities. I most strongly object to small and scattered works in the vicinity of the applicant's homes. The distance test is the best, and there is better supervision and management if the relief works are few and large.

The works should be placed in charge of the Public Works Department. I should prefer that the Public Works Department officers should confine themselves to the execution of the work only, and that the management of the camps, and the admission and rejection of labourers, and the food supply, should be under civil officers, because the officers of the Public Works Department in charge of works are not all acquainted with the language of the district and the people. But I am aware that this arrangement has its drawbacks. Financially it would be more expensive, and probably it would come to this, that we should indent for officers on other presidencies and provinces, and the same difficulties would occur; so that, looking at the whole question, I think perhaps the entire management should be left in the hands of the Public Works Department.

I think that the Public Works Department officers should, in all matters except those which relate to the actual execution of the work, correspond with or through the collector of the district. This was not done in the late scarcity.

The Public Works Department officers should select their works in consultation with the collector.

The collector should, of course, be mainly responsible for seeing that everyone does his duty, but if the entire management of the works, and the admission or rejection of applicants and their food, &c. are placed in the hands of the Public Works Department officers, they would resent interference. I therefore think that all Public Works Department officers in a district should, in a time of scarcity, be considered, in all except scientific matters, as assistants to the collector.

Mr. Robertson.—If a local officer believes distress to be temporary, and is not satisfied that the distress is indicative of approaching famine, he should,—

1st. Establish village to village inspection by appointed officers, so that all bad cases may be got at and sent to a relief camp, and those requiring labour sent to some public work not too near to their homes.

2nd. He should establish a relief camp under proper supervision, where all who are not fit to work, or are sick, can be fed and treated.

As the people at this relief camp become fit for work he should weed them out, and send them with tickets for employment to works.

People should in all cases be employed on works under the Public Works Department, and, as long as distress is only temporary, on ordinary works in progress.

As regards tests for admission, the district officer or famine officer can easily tell if a man is fit to work. When a man is at a relief camp his fitness will be decided by the local officer and the medical man in charge.

As soon as it is seen that distress is extended, and that ordinary works cannot provide sufficient employment, then special works should be opened.

Most certainly the works should be so arranged as to employ large numbers at one place in such case, and then only is proper work and proper supervision obtained. If the works are scattered, Government charity is sure to be misapplied; numbers who can maintain themselves, but who will not move to a distance from their villages, will by joining works near their homes obtain relief when they ought not to receive aid. There will and can be no proper supervision and organization at scattered works, and thus dreadful cases of distress may arise.

As a rule, all famine relief works should be under Public Works agency. Only the aged and those not physically able to work properly should be employed under Civil supervision.

In a district the executive engineer, either for roads or irrigation, is always in official relations with the collector; while again when famine works are in progress, the assistant executive engineer or other officer is in communication with the assistant collector. An order from Government that the district officers and public works officers are to work in cordial co-operation is all that is requisite.

The collector, advised by his district officers, will communicate to the Public Works Department officer the taluka or portion of a taluka where some relief work is required, and the Public Works officer will use his professional skill in selecting a work, or probably there may be plans ready for works in that locality. If any particular scheme should appear feasible to the district officer, the collector would bring it to the notice of the officer of the Public Works Department.

The responsibility that the works are being properly executed, and proper order, &c. maintained on the large works under the Public Works Department, will rest with the chief executive officer of the Public Works Department in the district, under the control of the superintending engineer of the circle. But the responsibility as regards the famine arrangements, and that all needful steps are being taken by all branches of the public service in a district (*i.e.*, collectorate), will most certainly rest with the collector, while each collector will in his turn be subordinate to the commissioner of the division, who is the next officer responsible to Government.

Mr. Wingate.—Small vs. large works.—(a.) In the beginning of a famine, it seems of the first importance to determine whether the district is threatened with a local scarcity or is a part of a larger area about to endure a widespread famine; and in the latter case, whether the district lies towards the edge or the centre of the affected tract. Once the famine area is defined on the map, a glance will show whether distress is limited to a particular locality or not; and if not, it should excite suspicion if a district well within the smitten tract professes to feel little strain, while an over-anxious officer on the outskirts might safely be re-assured.

If the scarcity is local there can be no question of large works, and as long as an extension of ordinary works on more or less modified principles may be expected to tide over the difficulty, I would leave each officer pretty free to pull his own district through its troubles.

And I would adopt the same policy, only with more organization, where the scarcity is widespread but not severe, *i.e.*, trusting to small works, but holding larger works in readiness, and here and there, as necessity arose, opening a larger work.

But if once convinced that a real famine was impending that would almost immediately involve operations on a larger scale, I think I should avoid small works. They seem scarcely necessary, for after a crop fails there is much movement of people, disturbance of prices and even panic, but there is no danger of any immediate mortality: while experience teaches us that if the civil officers begin a lot of works, they are so worried and busy that they neglect coming troubles and responsibilities; and if the Department Public Works officers are hustled into the field and crowds of workpeople collected before things are half ready, the professional officers are disgusted and harassed, the works badly laid out, the people idle and undisciplined, till a halt is called and the work has to be closed to applicants, just as a pinch is beginning, till order can be restored.

(*b.*) During wet weather, or towards the end of a famine, or when for any cause the people of any tract are much depressed, the aid of small works might be called in.

But for the main system of relief in severe famine, I believe large works the only economical system, for not only do they give a good return in the work done, but they economise supervision and keep down the numbers seeking relief.

I do not say that small works cannot be managed so as to secure a return in work, but from what I have seen, they either necessitate piece-work management which keeps off the weakly,* or if the weakly are admitted, scarcely any work at all is done; and supervision on an extravagant scale is needed to get work, protect the weakly, and keep off the non-necessitous.

On a large work the officers and people settle down and large numbers can be admitted and controlled without trouble; small works are continually changing, officers and people always harassed where they are to go next, while no officer can feel sure that somewhere or other things are not going wrong.

Most officers who advocate small works, also advocate, I notice, no tests, except that of a given piece of work to be done for a given sum of money. But these officers who know that in a severe famine more than half the population will be willing to work outside their houses for a couple of annas a day, while thousands really in want shrink from piece-work, will not be satisfied unless they have only the minimum number on relief, and that number comprises those most in distress. Anyone responsible both for economy and the condition of the general population will find large works his strength; and here and there, for special reasons, he can use small ones too. Department Public Works officers who urge small works would probably not feel inclined to be made responsible for the physical health of the district; and civil officers who do so, would dislike a strict account office and strict inspection.

Briefly, then, I would, in ordinary scarcities, when numbers seeking relief are moderate, depend on small works, supplemented by large ones, if necessary; but with real famine in view, I would turn the whole strength of my civil establishment towards accurately forecasting the calamity, and of my Department Public Works officers to making ready for very large numbers, and I would allow no small works or half measures at first, but depend wholly on large works, and as distress deepened or weather necessitated I might bring small to my aid, if necessary.

---

* Weakly people can only be admitted with a graduated scale of piece-work; to get this the people must be classed, and each class worked separately, to do this on numerous small works woud need an enormous establishment.

MADRAS.

Mr. Price.—I would, when distress appeared to me temporary, go on with ordinary works for which allotments had been made in Local Fund or Provincial Budgets, and I would not disturb the usual mode of supervising and directing these. I would at the same time, if this had not been (as it ought to be) done before, decide, with the chief officer of the Public Works Department, what larger works should, as famine measures, be taken up, and I would make preparations for setting about these if matters became worse. In the earlier stage of distress I would take on all applicants of the cooly class, making the sole test a proper day's work for the ordinary wages, and relentlessly cutting off a portion of these for short work. When it became clear, from increasing prices and demand for employment, the lapse of the cultivating season without sufficient rain, and the failure of crops on the ground, that a famine was inevitable, I would begin special works, and at that period I would prefer massing the people on a few localities at a reasonable distance from their homes, placing them under efficient Public Works Department supervision and exacting a full task. If matters became still worse, I should open smaller works nearer the homes of the people, but employ upon them only those who were weakly, leaving the larger works still occupied by the strong.

I am decidedly in favour of leaving all relief works, no matter of what kind, under the supervision of the Public Works Department. I have always been strongly opposed to placing anything but the most petty works, such as clearing silt out of drinking ponds and making small sanitary improvements around villages, under the superintendence of civil officers.

My reasons mainly are that the profession of an officer of the Public Works Department is the planning and superintendence of irrigational and other works; that the civil officers, as a rule, are totally ignorant of the way in which work should be done; that the officers of the Public Works Department are accustomed to measure up and account for work, which civil officers are not; and, lastly, that where a famine really occurs, a civil officer, even if he understood how to carry out any particular work, has so much of other matters to attend to, that he cannot give the necessary time to the supervision of work which, if it cannot be actually overlooked by a professional man, can be inspected and directed by him with more effect than by an amateur.

I know of no single argument in favour of placing relief works under the direction of civil officers. I speak from a comparison of the results in the Cuddapah District, in a portion of which the late Mr. Schoury undertook the entire care of some relief works and the supervision (charge remaining but nominally with the civil officers) of others. The out-turn and the quality of the work thus performed contrasted in a most remarkable way with those of work in other parts of the district which, owing to no fault of mine, was overlooked solely by civil officers. I consider that the chief district officer and the Public Works Department head of the district should, in consultation, settle all questions connected with undertaking special relief works. It should be the duty of the former to decide in what particular locality relief of this kind should be given, and to arrange through his subordinates for the supply of materials for camps, provisions, carriage, &c.; and when the work to be executed has been settled upon, to send to it the necessary coolies with rolls; and it should be the duty of the latter to be prepared with a sufficient list of works, to be able to state for what number of men, women, and children each one will provide employment, and for what period it will do so; and, finally, after discussing and settling with the collector which of these, as regards situation, nature of work, &c., is the most likely to afford efficient relief with the most chance of eventually the least loss to the State, to take it in hand, depending only upon the civil officers for his coolies and supplies. The responsibility that the needful steps as regards works are taken should, I think, be with the head of the district, the chief officer of the Public Works Department being responsible for the planning and execution of all works and the accounting for them.

Mr. J. G. Horsfall.—No special relief works need be opened. Ample employment could be found in ordinary works being carried on under the Public Works Department, Local Fund Boards, Municipalities, and Civil Officers. So far as possible the allotments of the year should be utilised and people readily admitted to the works upon piece or task-work. It would be sufficient in such a case if the superintending agency were strengthened, and regularity of payments ensured.

It is only when these works do not suffice to meet the crowds of applicants for works that special works should be opened, and these should at first be so arranged as to give employment to small bodies in the vicinity of their homes to which they would be able to revert at once upon the advent of a favourable monsoon. Abundant work of this kind can always be found in repairing or making village roads, repairing irrigation tanks, excavating or repairing drinking-water tanks and wells, reclamation of land covered with prickly pear, and the like. Of these only petty works requiring no engineering skill should be carried out under direct civil control, aided and supervised by the Public Works Department. The officers of the Department of Public Works are by education and training better qualified to superintend all works. They can estimate and see that the work done is adequate to the remuneration allowed. They have the advantage of being educated to carry out such works. It is only with regard to petty works such as clearing prickly pear, repairing village roads and village drinking-water tanks and wells, and such like that professional supervision is unnecessary and would prove too expensive. Such works as these can easily be carried out by the village officers, supervised by a Revenue inspector or clerk from the taluk cutcherry and checked by the Tahsildar and divisional officer, and occasionally by the district officer himself.

The selection of all works should rest with the collector and district engineer combined, except in the case of minor village works to be carried out under the superintendence of civil officers. These should be left solely to the discretion of the collector. When a sufficient number of works has been provided, the applicants for works should be passed by civil officers, leaving the execution of the works and their regulation as to task or piece-work entirely to the Public Works Department.

Works of public utility should invariably be selected, such as the improvement of water supply for irrigation or supply of drinking water; secondly, the improvement of communications, such as roads, railways, and canals. These works should be selected as far as possible near the centres of distress.

The responsibility of seeing that all needful steps are taken by all branches of the service should rest primarily upon the collector.

Mr. Sewell.—If the distress is expected to be merely temporary, applicants for relief should be first employed on the ordinary works which should be pushed on and extended as far as possible, I mean Local Fund roads, tank repairs, &c. Municipalities, as a rule, have so little money to spend on new works that they cannot do much in this way. Moreover, there are manifest objections to collecting large bodies of people in towns during seasons of distress. I do not think any test is required at this stage. Few will apply for work who do not really need it. If distress increases, it becomes necessary to open special works, and in the early stages I would rather give employment to small numbers near their homes, than collect them in masses. Such works, *e.g.*, tank repairs, formation of village roads, clearing village sites from prickly pear, can, I think, be best looked after by civil officers. Public Works supervision is so costly that it is not worth while to expend it on small and scattered works. As famine extends, I would advocate large works placed under professional management, such works being of course selected by the civil and Public Works officers in concert. Irrigation works, which will be remunerative either directly or indirectly are the best to take up. In this district, as mentioned above, we are so well off for roads that I would not advocate anything extensive in that line. The collector, of course, is responsible for the general state of the district, while the district engineer has the actual control of such works. If these two officers do their works properly and pull together, I do not think any difficulty can arise in this matter.

Major Baynes.—(*a.*) The locality of the ordinary works in progress should be widely made known; payments on them should be made at least three times a week so as to meet, as far as possible, the wants of the classes already mentioned (p. 18). A staff should be organized for the prosecution of special works, so as to afford employment immediately an abnormal pressure arose on ordinary works in progress; and, if local traders were keeping up fictitious prices by combination, I should import grain from places where it was more abundant and selling at a cheaper rate; and thus lower prices by selling to the coolies grain brought by myself; because to increase the rate of wage to meet unnecessarily high prices of food is simply to throw money into the hands of the traders at the public expense; and the water supply should be most carefully watched and maintained by cleaning out old or sinking new wells on petty contracts.

(*b.*) As long as the ordinary works in progress sufficed to meet the demand, I should leave them in *statu quo.*

(*c.*) I would apply no further test than the simple request for employment on task or piece-works; it may be assumed as a fact that the agricultural and urban population are only driven by necessity to abandon their usual avocations and their homes to seek employment on a Government work on which an outturn equivalent with the wage is demanded.

(*d.*) Immediately ordinary works in progress cannot meet the demand for employment, but all the working plans, specifications, and estimates connected with such works should be prepared and kept ready for this emergency, because, when the pressure of famine begins to act, the effect is awfully rapid; in a few days hundreds become thousands, and before labor can be supplied to those seeking it, they become physically incapable, and then the demoralisation of the laboring classes sets in with a force which cannot be subsequently stemmed; this could be prevented by having the plans and estimates of special works for every taluk prepared beforehand and kept in the collector's office to be taken up on an emergency, and, if the necessary augmentation of staff for supervision of them was made as soon as there was indication of an abnormal pressure on ordinary works, there would be no delay in opening them. The absence of this preparation was the chief cause of the disorganisation in my taluk.

(*e.*) I would divide the affected taluks into circles having a radius of ten miles, and in the centre of each I would have a special work of Class I, so as to avoid the collection of coolies in unwieldy masses; the results of so doing have been shown to be imperfect supervision, delay in measurements, and consequent irregularity in payment of wages; sickness resultant on insufficient or over-crowded accommodation and scanty supply of water; death caused by want of medical treatment; epidemic disease generated by imperfect sanitation; for, however good the sanitary scheme may be, the attempt to obtain a voluntary submission to its rules from a mass of undisciplined people whose habits are filthy will prove futile, and a compulsory observance of them will necessitate so large a cost on the sanitary staff that it would be very disproportionate from the result obtained and from the sum paid as wages to the coolies for whom it has been formed. Moreover, this question involves that of the distance test which is discussed in Chapter III.

(*f.*) At the same time, I would strongly oppose the opening of numerous petty works under Civil Agency —such as were styled "village site improvements, eradication of prickly pear;"—at all events, till all other special works were exhausted; because they can neither be efficiently supervised on account of their number, nor can they permanently supply the amount of relief required during a season of distress; moreover, they utterly unfit the ryot for employment on special works of a legitimate character, for, when he has been morally demoralised and physically weakened by being paid a bare subsistence for the eradication of prickly pear at his doorway or for digging a hole in his village pond, it is impossible to get him away from his village to do fair work on increased pay.

I would divide special works into two classes. The first would include road construction and all irrigation works; in every circle I would have one work of this class which I would style Class I. The second would comprise repair of existing roads, collection and breakage of metal on them and on roads under Class I, which I should style Class II, and I would not require labourers to come to works of this class from a distance greater than three miles.

To Class I, I should attach—

Men and married women up to forty-five years.
Unmarried women from twenty to forty-five years.
Lads and girls from twelve to fifteen years.

Marriageable girls between fifteen and twenty and children over ten years would be attached to this class if accompanied by their parents or near relatives; and, if marriageable girls though unprotected, desired admission to it, I should not refuse them. I should not separate a husband from a sick wife or *vice versâ*, nor a parent from a sick child; in such cases I should temporarily employ the able-bodied relative on Class II.

To Class II, I should relegate adults between forty-five and fifty-five years, nursing mothers, and women in advanced stages of pregnancy, marriageable girls between fifteen and twenty, and children between ten and twelve years if they had not an adult relative in Class I whom they desired to accompany.

The persons attached to these classes should be able to do seven-five per cent. of the ordinary out-turn of an able-bodied laborer of each class. I am strongly opposed to the employment of children under ten years of age, and would as strongly advocate the gratuitous supply of cooked food to all below ten years who are eligible for relief, either in their village kitchen or in the camp attached to the work on which their parents were employed; the former plan is the best for many reasons; the cost of so doing very slightly exceeds that of employing them, but the results of the two systems are very different. Children of this tender age, if worked all day for a continuance, become prematurely old and do not thrive on any amount of food; they want less work and more play; during the famine, children over *seven* years were *compelled* to earn their bread by *working* from 7 a.m. to 5 p.m.; very few children of this age could stand this exertion even for a few days, and I did not carry out this order in consequence of the injurious effect it would have had on the "rising generation."

(*g.*) Under civil supervision, as far as classification of laborers, issue of pay, sanitary and medical arrangements, supply of food, and the general welfare of the labourers and their children are concerned. The interference of the Public Works Department should be confined to matters purely professional and to measurements of work done (see paragraph XVII *b*, Chapter III., section I).

II. Qn. 6.

MADRAS.

(*h.*) In stating my reasons for placing the unprofessional branch of the administration of relief works under the Civil Agency, I must premise that my remarks apply only to my own taluk, and are the result of my limited experience; and that I only desire to comment on a system as it presented itself to me, not on individual officers of the Public Works Department. It is true that this department did not take any active part in relief operations in my taluk till September 1877, but in March 1878, it was unable to make regular payments, and coolies were starving on some works because wages were in arrears as much as three weeks.

Generally speaking, I consider that the welfare of the relief coolies and their families was held a secondary object to the attainment of professional interests and the maintenance of departmental routine; nor, if this be the fact, is it one to create surprise, because the European officers of the Public Works Department are never brought into *direct* contact with the coolies employed on their works, they deal with contractors through their overseer; and make only large payments on carefully-checked completion certificates; they are not as a body conversant with the language, feelings, or capabilities of the coolies, and the professional habits and training acquired by them under a systematic discipline cannot be broken through without a total disorganisation of the department; and my experience goes to show that the department is not *naturally* constituted to act as a relief agency, that it is not sufficiently *elastic* to become so with sufficient rapidity, and that its officers, high and low alike, never realised the fact that the *primary* object of a relief work is to *save life*, and not to sacrifice it to the maintenance of departmental rules and systems of accounts.

(*i.*) I would leave the selection and time of commencement of special works, previously sanctioned for an emergency, to be determined by the collector of the district, who should intimate his wishes on these points to the district engineer in sufficient anticipation of their being actually required, to allow of that officer making his departmental arrangements for supervision of professional details and for securing regular measurement of the tasks performed by the gangs.

(*k.*) By the district engineer subject to the condition of distance mentioned in sections *e*, *f*, of this paragraph, and on a request from the collector, he should be empowered to extend those or open others in anticipation of sanction, supposing the necessity arose for providing more labor than was originally estimated as requisite.

(*l.*) On the collector and the district engineer; the former would be responsible for all relief details, the latter simply for the correct prosecution of the work and submission of measurements. Payment of wages on pay sheets passed by the Public Works Department should be made by the Civil Agency.

MYSORE.

MYSORE.

Colonel Sankey.—To the inquiry, under what tests the applicants should be admitted, I can only reply by opening up the whole subject of tests, which at this initiatory stage seems to me as applicable as at any other. After what I have already written, I can only submit my opinion that all the test required is, that persons looking for State aid should be required to work at piece-work rates, suited to the ruling price of grain, and to their individual capacities; and that all artificial tests are not only needless, but likely in most cases to be mischievous, causing both loss to the State, and needless suffering, if not death, to the distressed individuals.

With the utmost respect for the humane motives which have unquestionably underlain the system adopted, for instance, in dealing with the Mysore famine since the introduction of the new *régime* in September 1877, it seems to me to have partaken far too largely of an artificial character. Among such arrangements I would include the following:—

(1.) That the applicant should travel ten miles from his home.

(2.) That he or she should reside* in a relief camp and submit to its discipline.

(3.) That no "well-to-do" labourer should be provided with any work by Government (see Section III. page 9, of *printed Collection*).

(4.) That no labourer should be encouraged, by any prospect of additional pay, to do more than his task.

(5.) That only a bare subsistence should be provided for those seeking relief.

(6.) That the State, instead of the parent, should support non-working members of families and infants.

(7.) That nominal rolls should be made out daily on relief works, showing name, caste, and residence of each applicant.

(8.) That such rolls should be called over daily before work commences (see Famine Code).

(9.) That pay should be disbursed, and tasks set-out and measured up, daily, &c.

To these principles, as laid down stringently in the Mysore Famine Code or in departmental orders, I would add the following lessons which Sir Richard Temple has laid down as the result of his experience, but which nevertheless appear to me equally artificial and unsuitable in their character, *viz.*—

"To prohibit absolutely, in the beginning of distress, the opening of petty works under Civil Officers, of non-professional establishments, among the villages close to the homes of the people.

"To refuse relief to strong, able-bodied persons of both sexes, in any form, who have employment on large public works.

"To allow petty village-works to be opened only where severe and widespread distress has declared itself at a comparatively advanced stage in any district or part of a district; and even then to reject all, save those who cannot reasonably be expected to proceed to the large public works, &c.

"To insist upon a systematic inspection by responsible Civil Officers of all relief gangs, person by person, and from time to time, in order to see whether they are all in need of or deserving of State assistance, and to note whether their physical condition improves or deteriorates.

"To reject every applicant for, or recipient of, relief, whether on a public work or on other works, who can be shown to be able to support himself for a time without State assistance.

"To keep wages on relief works at the lowest rate compatible with the health of the labourers; this being necessary not only in the interests of economy, but also to prevent demoralisation of the people."

In reference to these, I shall only add some brief observations to what I have already advanced on the subject of tasks, distance test, and bare subsistence allowance.

As regards the first, I find, in a memorandum by Mr. Elliott, of 12th February 1878, *that he* saw fit, in dealing with the work of Sergeant *Heinig's* (Mullapa Chetti) tank, to substitute piece-work for tasks; observing—

"Accordingly, Mr. Target and I came to this conclusion, *that only two rates should exist*—piece-work and the old B scale (*i.e.*, two annas for men and one and *a half anna for women*); *that every woman should have the chance of getting piece-work rates*; and *that no one should be put in B pay unless* he or she, being able-bodied and fit to be put in the A class, refuse piece-work."

---

* This may be very essential, however, in dealing with professional beggars and waifs and strays generally.

Again, in regard to the Chick-Hoscotta series, Mr. Elliott observes—

"I think that every effort should be made to get the people on to piece-work."

The distance (that of ten miles) was also apparently discarded after sufficient trial; but the same Famine Proceedings from which I have quoted above show that the Commissioner was not prepared to abandon this entirely ; and such being the case, I will now quote from his memorandum on the Kolar district, dated 10th February 1878, having reference to the point :—

" . . . . So much for the villages ; in the towns there is not so much employment to be had . . . . I am satisfied that the time has come when we ought to open a relief work near each of the large towns.

. . . . "If possible, it should not be so far from the town as to entail the necessity for hutting the labourers, nor so near as to be quite at their doors ; the best position would be two or three miles off, so as to force them to shew their need of relief *by taking a good long walk in addition to their daily task*."

Walking being only one of many ways of expending vital force, I must confess myself entirely at a loss to understand why the three hours thus proposed to be employed in going to and in returning from work should not be turned to the profit of Government by having the work as close to the doors of the people as might be conveniently feasible. As it stands, the proposal seems to me to insure deliberate waste for no conceivable object, as it is clear that a corresponding addition to the task near home would equally test the sincerity of the applicants.

In reference to the "bare subsistence" of which so much has been said and written, I confess it is to my mind quite as untenable as the other tests.

The *first* objection to it is, that, being insufficient for the support of a working labourer, Government cannot get an adequate return for the wage given, it is therefore uneconomical ; the *second*, that disbursed as the wage or its equivalent may be, for the use solely of the individual recipient, it interferes with the universal law of providing for offspring, and with the almost equally strong native custom of providing for poor relations, caste brethen, and hangers-on ; and the *third*, that its inevitable tendency is to underfeed the children, and thus undermine the physique of the rising generation.

The latest ruling on the subject of this "bare, subsistence" allowance, as applied in the North-Western Provinces, appears for an adult to provide as follows :—

10	chittacks of	wheat-flour,
2	„	dâl,
¼	„	salt,
1½	seers	firewood,

and is, therefore, an improvement on the 1 lb. meal previously prescribed by Government.

Writing in 1874, Sir Richard Temple observed that the rate, as proposed by himself—

"¾ of a seer, or about 1½ lbs., per head for men, women, and children, at which grain should be provided, was assumed after due consideration and discussion. The lowest diet provided in Bengal jails for non-labouring persons is equal about 1 seer, or 2 lbs. The ordinary diet of a labouring adult in Bengal is taken, after statistical inquiry, to be 1 seer of rice, ¼ seer of fish, pulse, pep or other condiments."

The ordinary daily meal for a cultivating ryot in Mysore falls little short of two seers (over 4 lbs.) of *ragi*, which is understood to be even a more sustaining grain than rice ; and although Sir Richard Temple and other officers supported, in dealing with Madras and Mysore, the sufficiency of a meal not more than one-quarter of this, I can safely say that, in the opinion of all Medical and Civil Officers with whom I have come in contact, and who had the best means of forming an opinion on this subject in Mysore, this average quantity (1 lb. of grain) was held to be wholly inadequate for labourers in work ; and that the inevitable tendency of such diminished feeding would be to lower the assimilative powers till the patient became after a certain time incapable of digestion. The feeding would, in fact, be not only ineffective, but dangerous if persisted in for any length of time.*

But the worst feature of the "bare subsistence" allowance is its baneful effect on the rising generation. If famine be only of short duration, under-feeding the adult population may possibly not inflict on them any very lasting injury ; but, surely, no one will contend that such will not interfere with the proper development of children ; and if continued beyond a certain point, that it will not inflict injuries which cannot be effaced for several generations, if even then.

The "bare subsistence" diet given to children must, I submit, have this inevitable effect, even when a responsible famine official is able to see with his own eyes that each child actually swallows what is thus doled out ; but if he is unable to give this guarantee, what may it be supposed is the practical result ? It is this : the child gets little or nothing to eat. Hunger overcomes every instinct except that of self-preservation; and in Mysore I have seen the most glaring examples of parents, when thus pressed, having deprived their own offspring of food. I have seen hundreds of women carrying on their hips living skeletons of children which they had brought to this stage, while satisfying their own wants. On this point I would appeal to Mr. L. Ricketts, the intelligent Deputy Commissioner of the Bangalore District. I feel assured, from all I have seen and heard on this subject, that I shall be supported in this opinion by the great majority of the Civil, Public Works, and Medical Officers who have served from the first through the Mysore famine.†

A writer in a well-known newspaper lately defended the "bare subsistence" wage, observing that—

"By raising the ordinary wages, and paying in the ordinary way when prices are at famine rates, the State runs the risk of not providing for women and children ; while to bachelors it would be paying much more than is necessary."

Strange infatuation ! It is alone by piece-work, and the facility the system affords for adjusting rates to any phase of the market, that women, children, and non-working members of families can be properly sustained ; while the contrary, as I have shown, is the inevitable result of the task system, combined with the "bare subsistence" wage. And as to the argument based on *bachelors* getting more than necessary, I need hardly say such ornaments of native society are practically unknown, in Southern India at least. If a man have no wife he is certain to have a substantial equivalent, and in any case hangers-on, for whom he must provide. In fact, while it is next to impossible, by any rigid system for distributing by measure through any State Establishment, to dole out the precise amount of sustenance required by every individual during famine, and insure economy in the operation, both ends are met in the most complete manner by the natural distribution which takes place through the system of payment by results. *The able-bodied labourer is, and must always*

---

* In the *Army Medical Report* for 1876 I find the following, page 223: "Sir Richard Temple assumed that it was possible to feed the people on a smaller amount than was given in the Bengal Famine, and accordingly only 1 lb. of grain was given instead of 1½ lbs., besides half an anna for the purchase of condiments. This amount was barely sufficient to maintain life in a state of rest, but was utterly inadequate for even a moderate amount of labour. The result was that, task-work being demanded of those people, they perished by thousands."

† Evidence of the same character may be had from Sir Charles Trevelyan's article in the *Quarterly Review* on the "Irish Crisis," in which it is observed: "The relief work did not always furnish a subsistence even for those who were employed on them. The wages, paid regularly in money, were higher than any which had ever been given for agricultural labour in Ireland ; but, at the existing prices of food, they were insufficient for the support of a family, melancholy proof of which was afforded by daily instances of starvation in connection with the relief-works."

II. Qn. 6.

Mysore.

remain, during famine, as in ordinary times, the natural distributor and economiser of wages. In the endeavour to perform artificially the same operation, hosts of minor, and therefore of untrustworthy, agents have to be employed; and no matter what the vigilance exercised by the superior officers, misappropriation must occur, leaving the objects in view unfulfilled. More money will, as a matter of necessity, be spent by the State, and less food reach the stomachs of the people. Without the least desire to dogmatise, I confess I cannot but feel that the "bare subsistence" wage is uneconomical, useless, and most cruel in its effects, on the rising generation especially.

Mysore, and probably the whole of the southern portion of the Peninsula, under the tank system, furnished an infinity of small works of the most useful character, the earth-work of which is capable of being dealt with by village *potails* under even non-professional supervision. These, taken with the enormous amount of small sanitary work calling for attention, *viz.*, rectification of bad drainage, filling-in unwholesome pits, levelling old mud forts and filling-in their ditches, clearing jungle, digging wells for the improvement of water supply, planting belts of trees to ward off unwholesome winds, &c.—that, taken in conjunction with such a three or four years' programme of Public Works as I propose, the field of selection, both of large and small works, would be amply wide to meet even the worst contingency of famine. When such, however, occurs, the actual selection must, I think, be left to the Local Government or Administration, unhampered by rules which may or may not be applicable to the particular circumstances of the locality, or of the form in which distress manifests itself.

As regards engineering works, particularly those of an ambitious character, I need say nothing: they will probably more than take care of themselves the moment the policy of Government is promulgated, especially if the present surplus Public Works establishment be utilised for the purpose.

To the concluding question, on whom should the responsibility rest in the district for seeing that all needful steps are taken by the several branches of the public service concerned, I think that the same reply may be given, *viz.*, on the Head of the Local Government, once the Government of India has authoritatively recognised in any province the necessity for exceptional measures.

And at this point I trust it may not be deemed out of place if I venture to offer some observations regarding the employment of special agency in the conduct of a famine campaign, under the direction of an officer armed with unusual powers, such as a Famine Commissioner, to whose advice the head of the Local Government is bound to attend, and who, so far as concerns all famine matters, is for the time being practically a dictator.[*]

It does not follow, because some such appointment for regulating matters in an entire province is found necessary, that therefore unity of action can only be secured by making a corresponding arrangement for each division or district, or *vice versâ;* still it appears to me that there are strong reasons for considering that the sudden change from ordinary routine thus involved would be as generally inadvisable as to carry out a change of commands and tactics with an army when standing in face of the enemy.

To decide on the success of the measure from the particular case of Bombay in the conduct of the late famine would, I submit, be fallacious. Unquestioned advantages of a certain kind resulted from the sudden administrative change there made at the commencement of the distress; but these were apparently for the most part due to certain personal elements most happily combining at the proper moment for the public good; also to the following facts:—(1) the famine neither in intensity nor duration was comparable to that[*] experienced in Mysore, or in many parts of Madras; (2) only a comparatively small portion[†] of the lesser ryots and subordinate cultivators were apparently affected, and relief was required chiefly for classes who could conveniently be gathered in large camps; and (3), whereas the civil officers soon ran out of small works, the Public Works Department had large schemes on which the Local Government was most anxious to have favourable opportunity for commencing.

The financial value of the works commenced in contravention of the previously expressed orders of the Government of India (see page 6 of my *printed collection*) remains to be ascertained, and their cost, past and future, gauged, before a safe conclusion can be arrived at regarding the measure of success attained in Bombay.

But his Excellency the Viceroy has, in paragraph 24 of his minute No. 131 of the 12th August 1877, pointed to a source of weakness in such special appointments which cannot be overlooked. He observes in reference to the appointments of Major-General Kennedy—

> "Of course, however, this arrangement might have been as injurious as it proved beneficial, had the officer selected, on whom the results of it depended, been deficient in experience, judgment, or energy."

It is sufficient matter of notoriety that ever since the formation of the Department the relations of the Public Works with the Civil Department have been more or less strained (to a greater decree, probably, in Southern than in Northern India); and if the course followed in Bombay were adopted as the rule for the future, it is to be feared a legacy of ill-feeling would be engendered which could not fail to be very detrimental to the public service in future.

If the Head of the Local Government have not the requisite force of character to counteract a tendency towards virtual supersession, in such a case, by his own Chief Engineer, the position would clearly be highly objectionable; but, on the other hand, if both be men of strong will, and imbued with different ideas regarding the plan of action for meeting the famine, a fatal weakness would be the result of their conflict of opinion.

Again, the appointment of a Civil Officer who, as Famine Commissioner, would stand between the Head of the Local Government and the Chief Engineer, would, I venture to consider, be still more objectionable, and particularly so if he be a stranger to the province.

In this latter case, with the urgent demands of famine pressing on his every moment's attention, such an officer could have no time to master the local facts sufficiently for forming safe conclusions; and as, from the very circumstance of his special selection for the post, he would probably be a man of distinguished ability and strong will, he would for this reason hold to, and defend with tenacity, the plan of campaign which, whether really well or ill devised, commended itself to his judgment.

A plan thus, of necessity, hastily *improvised* could not reasonably be expected to accommodate itself to all the complicated circumstances and requirements of a province suffering under famine, when, as

---

[*] As this is apparently a strong term, I beg, in order to avoid misapprehension, to quote the terms under which, for instance, the Famine Commission of Mysore acted, and from which I have drawn this conclusion. In Government of India letter to Chief Commissioner of Mysore, No. 821 of 8th September 1877, it is observed that "he should have authority, when "travelling in the interior, to give instructions in your (the "Chief Commissioner's) name to the local officers;" and in circulating this, the Chief Commissioner directed (on 16th September) that "all written, or, in minor matters of detail, "verbal, instructions, which may be given by that officer (the "Famine Commissioner) direct to the Deputy Commissioners "should be promptly carried out."

[*] In only two places, Belgaum and Dharwar, was grain as high as 9 lbs. per rupee in August; and only one place, Kaladgi, in September 1877, in which latter month the famine may be said to have ceased. For corresponding prices in Mysore, see footnote to my *printed Collection*, page 3.

[†] See paragraph 17 of Sir R. Temple's Famine Minute of 24th December 1877.

CH. II. QN. 6

MYSORE.

we know, the whole fabric of society verges towards dissolution, and would almost certainly be in many respects quite mistaken. The very ability and character of the selected officer would necessarily aggravate the evil, and crotchets of the most mischievous kind might easily take the place of a sound and intelligent treatment of the disease.

It thus appears to me that, in the management of famines for the future, the aim should be to pass into the new conditions required with the least possible dislocation of the existing machinery of Government; by, in fact, a simple process of expansion.

Major Scott Moncrieff.—The first measure to be adopted as long as it is doubtful whether famine is approaching or not is for the district officer to obtain a relaxation of budget rules both as regards Imperial and local works. The first effort must be to give full employment to the able-bodied. Repairs to roads, canals, &c. should be pressed on, and if these are not enough, and there are no sanctioned new works in progress in the district, additional ones should be started, which it is to be presumed will have been prepared against this contingency. There should be no test save willingness to work, no special relief arrangements. At this stage it is enough to pay rigorously according to work done, but there ought to be plenty of work, and no man willing to do his day's task should be turned off because he does not look in want. A few large works are unquestionably better for supervision than many small ones, but if the people will not resort to them, works must be found to which they will resort. At this stage if the Public Works Department can take in hand the supervision of the works it is better. Their organization is in every way superior to that at the command of the civil officers, and it is not till later than this that mischief is likely to occur from the Public Works officer insisting on a standard or rate of work incompatible with relief to the starving. The executive engineer and the officer in charge of the district should be in the closest friendly communication. If they will not work together, one or the other should go. The Public Works officer must select those works on which he can employ the greatest amount of unskilled labour with the least expenditure of supervision and of materials, and his works must be as near as can be to the centre of distress. Earth work is the best form. The collector or deputy commissioner must be responsible for seeing that in his district all is done which ought to be done.

Mr. Ricketts.—Even if I believed the distress to be but temporary, I would not advocate employment of applicants for work on ordinary works in progress, as there would be existing labourers on such works, and many of whom ordinarily maintain themselves and families by such works. Besides the assumption that it was only temporary distress would in part be based on existing facts, one of which would be the existence of such works and their power to provide for a certain number of then working people. I would therefore in the state of facts under consideration consider it desirable to open special works, the test being comparative poverty and task work, the works should be spread over many places so as to employ smaller bodies and in the vicinity of their homes; and such works should be under civil supervision, except in localities where the services of Public Works Department officers are available. Large numbers of work people on one work are standing menaces in a sanitary point of view and invite cholera visitation which is spread far and wide as the large numbers disperse to their various homes. Large numbers are more difficult of control and payment. A large work with the cessation of temporary distress might be left unfinished, which would scarcely be the case with a smaller one. The little work is often much needed, and working near their homes preserves domesticity and morality. In the civil branch there are more subordinates than in the Public Works Department, and they know the people better. Otherwise I should say the Public Works Department was the best agency. The district officer and his assistants must personally work and confer with the executive engineer and his assistants. The work might be selected by the Public Works Department in previous concert with the district officer, who, as a rule, could readily name numerous projects, all useful, and many of them both necessary and remunerative; and in case of difference of opinion the commissioner and superintending engineer should settle the point. I think the responsibility for seeing that all needful steps are taken by all branches of the public service concerned should rest on the district officer.

Colonel Johnson.—When distress has declared itself, and it has been decided that relief is necessary, works in progress in the distressed locality should be thrown open to all applicants, whether the works are under provincial or local officers, the Public Works Department or municipalities. The only test desirable is that the people employed shall receive payment only for the amount of work they turn out. The rates may, if necessary, be raised so as to permit of the people earning sufficient to support themselves under the increased prices of food; and if this be done carefully there is no probability of anyone resorting to the works who is not obliged to do so for self-support. It is above all things necessary to induce the people to flock to the works at the commencement of famine, so as to keep up their strength and condition, and not only theirs but that of their families also. The piece-work test allows of this being done, and of entire families being employed, excites a spirit of emulation amongst the people, preserves their independence, insures Government getting full value for its expenditure, and is less trouble to all parties than any other system. Anything in the shape of bare subsistence rates, except for confirmed malingerers (who should never be allowed near able-bodied works), cannot be too strongly deprecated.

It is desirable to open special works, first, where there are no works in progress within a convenient distance of the distressed locality; 2nd, when some of the people are unable to do sufficient work at ordinary rates to earn enough to support themselves.

It is inadvisable that incapables should be worked with able-bodied labourers, and they are best employed on distinct works, or if the works are large enough, at a distance from other labourers.

As regards the distance the works should be from the distressed locality, the nearer they are the better, but if there are suitable works within 20 miles, it is in my opinion quite unnecessary to open fresh works for able-bodied labourers. In case of rain falling they can get back to their fields easily from such a distance in a few hours. In case of there being no likelihood of their being suddenly required at their villages, they might be expected to go 40 or 50 miles for work.

The numbers that may be employed together should I think be mainly regulated by the works available, and will be commented on when answering question regarding large and small works.

All works for able-bodied labourers should be under Public Works officers, if available. Works for incapables may also be placed under Public Works officers, if available; but this is not likely to be the case, and a Public Works officer is thrown away in looking after people that can do no work, when there is abundance of work to be supervised elsewhere. Incapables and people who will not work require special provision:—medical skill to attend to the sick, magisterial powers to deal with malingerers, skulkers, &c.,—there is no object in saddling a Public Works officer with these duties. They may be better performed by revenue, judicial, medical, or other officers specially appointed for the purpose, the more so, as in case of general distress a number of extra officers having to be appointed, they may be specially selected for such duties. Neither is any useful object gained by working incapables with able-bodied. I have no doubt whatever that lakhs upon lakhs of rupees have been thrown

H. II. Qn. 6.

Mysore.

away during the late famine, simply from neglect of the apparently self-evident necessity of keeping these classes distinct.

There does not seem to be any necessity for further provision to place Public Works officers in communication with district officers than already exist.

In the selection of works for relief, Public Works officers should be guided: 1st, by the utility of the work. 2nd. By its situation with reference to the distressed locality. 3rd. By the suitability of the bulk of the work to be done to the people who are to carry it out. 4th. By the sanitary condition of the site of the work and means of obtaining supplies, water, &c. 5th. By the state of health of the people. If cholera or other similar epidemics are prevalent it will be inadvisable to collect people in large gangs, and small detached works would probably be more suitable.

The responsibility for seeing that all needful steps are taken in a district should of course rest on the district revenue officer. It appears to me that during a famine, much more than at any other time, it is advisable that the management of a district should be left in the hands of the officers that know most about it. The number of officers may be increased to any extent desirable, and inefficient men replaced by efficient; but the normal machinery of Government should on no account be disturbed.

H. II. Qn. 7.

Question 7.—Poorhouse Relief without Labour Test.

Under what circumstances should poorhouses be opened to give relief without a labour test? Are there any other practical ways of affording relief at this stage, except through private charity?

Punjab.—7 officers have answered. Opinions not unanimous, but chiefly that poorhouses must be opened when required for beggars and infirm poor without test if applicants unable to work.

North-Western Provinces.—28 officers have answered. The majority of opinions corresponds with those of the Bombay officers.

Bengal.—16 officers answered. Poorhouses are necessary when beggars and wanderers increase, and no labour test should be applied, as the inmates should be unable to work. Cooked food to be given.

Bombay.—13 officers have answered the question. The majority think that when there are numerous destitute persons who cannot work, poorhouses must be opened for relief without labour test. No other plan is suggested.

Madras.—26 European and 4 Native gentlemen have furnished replies to this question.

The general opinion is that it is unnecessary to open poorhouses and camps for gratuitous relief at the earlier stage of famine, especially if at the commencement employment on sufficient wages is provided for the able-bodied, which will not only prevent them deteriorating in physique and coming on gratuitous relief themselves, but will enable them to maintain as usual those members of their family who are incapable of working, and who would otherwise have to be supported by the State. The stage succeeding that which calls for special relief works is considered to be the time when poorhouses should be established for the relief of those who are unfit to work, and from whom, therefore, it would be absurd to demand a labour test. This need not prevent the inmates being employed on light work in and about the camp, when they are able to do it. To supplement this form of relief, house-to-house visitation, and the distribution at their homes of money and grain doles to persons whose social customs or physical infirmities preclude them resorting to relief camps is suggested. Another suggestion is that village kitchens are more effectual as a means of relief than the congregation of large bodies of paupers in poorhouses.

Punjab.

PUNJAB.

Muhammad Hayat Khan.—Poorhouses should be opened only when the distress assumes a gloomier aspect, and the people are driven from home by hunger. Such persons should be admitted into them as cannot, on account of old age or infirmity, work. They should not only be provided with food, but should also be housed and clothed. These poorhouses may be supported from three sources: (1) Imperial funds; (2) subscriptions raised from private individuals; (3) district and municipal funds.

Colonel Parsons.—(*a.*) Gratuitous relief is admissible when the proportion of 'incapables has increased to an extent that renders it unreasonable and inexpedient that they should continue to be a burden on the miscellaneous charity of the community. (*b.*) In aid of private charity a grant from the district funds disbursed under district supervision is a practical and appropriate mode of affording relief.

Mr. Coldstream.—The experience of distress I have had convinces me that gratuitous relief is *desirable* as soon as works for the relief of distress are necessary. But to the introduction of gratuitous relief by a special agency and at new centres *at this early stage,* there are insuperable objections. It is disproportionately expensive, for it requires careful and complete organization and superintendence.*

But much good may be done, *i.e.*, lives may be saved, by putting small sums of money at the disposal of selected *Zaildárs* and *Lambardárs*, and holding them responsible that deaths from sheer want are prevented in their villages and circles. Now that a famine fund is at the disposal of Government, I recommend that this plan be adopted in cases where the necessity for relief at home has not yet become quite clear.

Mr. Roberts.—A labour test is desirable in all cases of poorhouse relief, and is essential except for people absolutely incapable of any kind of light labour; but most of the recipients of relief are hardly able to crawl to and from the distributing house, much less to work. At first, however, many professional beggars

---

* This illustrates *the* great danger of the British rule. It is better to let children fall sometimes when trying to walk than always to hold their hand. It is better to allow a few accidents arising from children running about than always to send out a nurse or tutor with them to keep them out of mischief.

See the remarks on the effect of Government by a bureau in *Mill* on "Liberty." Would that all Indian administrators took heed to his warning.—A.B.

Punjab.

obtained admittance, able to work but unwilling, and the introduction of a rule requiring them to grind corn for their own use, reduced the number at the Gurgaon poorhouse in one day from 120 to 40.

Mr. Nicholl.—Poorhouses should be opened to give relief to the blind, the infirm, and those people who are, from whatever cause, unable to work.

Poorhouses and private charity for these people are sufficient at this stage.

Mr. Benton.—I think that during the earliest stages of distress poorhouses are not required. I have never seen the poor and infirm abandoned by their richer relations; and although mendicants may perhaps not obtain alms so readily from those who formerly supported them, what they receive may perhaps be supplemented by the charity of others, who may open their hands in consequence of severity of the season. Moreover, if they should be on shorter rations for a time, no damage would probably be done, and their case is not likely to continue long concealed from the authorities, whatever may become of others.

NORTH-WESTERN PROVINCES AND OUDH.

North-Western Provinces and Oudh.

Mr. W. C. Plowden.—If I was proceeding to attempt to organise private charity in a time of great temporary distress in a district with which I was familiar, I should proceed somewhat in the following manner:—

I should first obtain, from the best sources available to me, a list of the persons who were in the habit of distributing either food or alms, and should endeavour to ascertain what were the sums of money expended annually by such charitably-minded persons. Having done so, I should call a meeting of all the influential men in the town or locality to which the operations of relief were to be confined. I should be careful to secure the presence of the persons on the list I had already obtained, and I should endeavour in previous personal communication with them to induce them to double their ordinary subscriptions or to go even higher. What one wants in such a case is to work upon those who give only as a matter of ostentation; the really charitable will give any way, and if the ostentatious find their less wealthy neighbours are giving freely, they also will put their hands deeper into their pockets.

I will suppose, then, that the public meeting has resulted in a fair contribution from the people; the next thing is to organise its distribution, and to arrange by whom the distribution is to be effected. As far as possible, I should leave it to the more influential men of the locality to supervise the distribution. Those who should receive charity should be divided into two classes—those who might be relieved in a poorhouse and those who should be relieved at their own houses.

Some slight task should be assigned to each person relieved, whether relieved at their houses or in the poorhouse. The latter should not be allowed to leave the poorhouse.

Mr. Sells.—Poorhouses would, in my opinion, be invariably necessary in any time of severe distress independently of any labour test. There are always a number of blind, halt, lame, and sickly people, who could not possibly turn out any work worthy of the name, and the requiring of work from whom would simply be equivalent to utter waste of material. Relief to such must, I am of opinion, be positively gratuitous.

Mr. Tracy.—A poorhouse or hospital should be opened at an early stage of the distress for the sickly and infirm, for lepers, cripples, and travellers exhausted by privation. I do not know of any other way in which relief can be given at this stage.

Mr. Mellor.—When works are opened in several places in the district, I think the plan of having a nursery attached to each work, and allowing those who come for relief and are physically incapable of work to be fed thereat without exacting any task is a good one. These persons will for the most part have relatives at work and will leave with their relatives, and go home when the temporary distress is over. Having large central poorhouses and making all the incapables congregate there separates them too much from their relations, on whom they have hitherto depended for support. Natives of this country as a rule are willing to support their old and infirm relations if they can, and it is a pity to do anything which would tend to weaken this feeling.

Mr. Kennedy.—Poorhouses are entered by the lowest and most destitute of the population. They are requisite at an early stage if public relief works are not opened. Last year the district poorhouse was opened in October simultaneously with the relief works under the district engineer. The people were by this time unable either physically or mentally to do the work which the district engineer demanded, and were sufficiently infirm to be admitted into the poorhouse. The consequence was that the poorhouse, notwithstanding the prejudices of the poorest class, continued to be much more crowded than the relief works. This year relief works were provided when the poor had exhausted their gleanings from the rabi harvest. They have consequently been much better attended than last year, while it has been sufficient for all needs to enlarge the municipal poorhouse and to establish a pauper infirmary. We have therefore had an opportunity of observing the effect of both policies, and I should strongly recommend the postponement of poorhouse relief until famine has considerably advanced. It is only after a time that the absolutely helpless are thrown off by private charity, or that persons become physically incapable of earning their own livelihood. Relief works on the other hand should be opened at an early stage in order to evoke the self-reliance and moral energy of the people. I am not aware of any other means of Government relief applicable at this stage. I am of opinion that a *mont-de-piété* would be extremely useful to the poor in the famine year. An application was made last year to Government on this subject, but on further study of the question I came to the conclusion that these *monts-des-piété* were unnecessary in ordinary years, and could not be properly managed by the Collector and his staff. Undoubtedly any scheme for enabling the poor to get a reasonable price for their valuables in a year of famine would be a great blessing if practicable.

Mr. H. H. Webster.—I do not think that there are any other physical ways of affording relief but by the establishment of poorhouses. A house-to-house system of relief, which is the only alternative I can see, is in my opinion calculated to demoralise and pauperise the people to a lamentable extent; and besides, it is open to the objection that it affords a direct encouragement to peculation on the part of the distributors of relief, over whose actions in the way of disbursements no check is possible.

Major Liston.—There is little fear of people fit for work in this district resorting to the poorhouses. As long as they can work they will. To prove this, I quote Lieutenant Bagge, R.E., who in the famine of 1868-69 wrote,—"Many of them to avoid the "imaginary disgrace of taking food from the

Ch. II. Qn. 7.

North-Western Provinces and Oudh.

"charitable kitchen, would rather toddle to the tank, "then work for the day and toddle off with their "pay in the evening; and I saw more than one case "where we had to send weakly and sickly people "from the works to the poorhouse."

Mr. Whalley.—If the first measures described in the answer to the last question are ineffectual in preventing the village destitutes from flocking into the towns in search of charity; or if distress manifests itself at once among the poorer part of the urban population as under exceptional circumstances may be the case; and from either cause destitute vagabonds infest the streets and bazaars for the most part unfit for labour; then it becomes necessary to open poorhouses.

Mr. Cornwall.—Poorhouses may be opened to give relief without labour to such persons as through sickness, old age, extreme youth, or debility are unable to work. Such of the persons as come to the poorhouse in a feeble state may, after being properly cared for, be strong enough to be drafted to relief works; and as an intermediate stage, they might be given light work to do at the poorhouse. Except through State aid or private charity, there seems to be no means of affording relief to such persons.

Mr. Daniell.—Poorhouses should be opened whenever there is evidence that helpless persons are suffering, old people, cripples, blind, widows, and children. I can hardly understand a case where relief works would be necessary much earlier than a poorhouse, and it is certain that after the persons on relief works can find employment at home, inmates of a poorhouse must remain until prices fall as they have no means of earning wages. Persons should from time to time be drafted from poorhouses to inefficients on the works when possible.

Mr. Crooke.—I do not believe that there are any circumstances under which a poorhouse should be opened without a labour test. Of course there are always a number of inmates—cripples and very infirm people—who can do little or nothing, but this does not affect the principle. As to *pardanishin* women, the only practicable way of affording relief is by establishing a native committee to collect the names of such people and distributing cotton to them, which they work up into thread and sell themselves or return to the poorhouse, where it is paid for, and a fresh supply of raw material is given to them.

Mr. Quinn.—The necessity for poorhouses arises as soon as distress begins. The beggar class of blind, cripples, lepers, &c., come on the hands of the district officers at once, and few of them can work. There are also a number of half starved wretches who have come in from the surrounding country, children who have been abandoned, &c., who must, for a time at least be fed gratuitously, municipalities can sometimes help.

Captain D. G. Pitcher.—So soon as the weaver class, a very large one, begin to show distress, a practical way would be to purchase, on behalf of Government, cloth in large quantities from these people at a price calculated to leave them a sufficient subsistence. This would keep large bodies of people at their homes, and the cost to Government should be little, as the cloth could be sold, when the distress was over, at but little loss.

Mr. Blennerhasset.—Poorhouses should be opened only for persons incapable of working, and only if it appears that such persons are in danger of starvation through the stoppage of ordinary charity. There are no other apparent ways of affording relief at this stage, except through private charity.

Mr. Lumsden.—Poorhouses should be opened to give relief in the shape of cooked food without a labour test to the aged, lame, blind, halt, and all suffering from such bodily infirmities as render it physically impossible for them to do any work.

Applicants of this description should be admitted into poorhouses as soon as it is clearly established that ordinary private charity is no longer able to meet the demands made on it for the support of the classes indicated.

Bengal.

BENGAL.

Mr. Barlow.—I have a great objection to poorhouses, which, from the nature of the case, are demoralizing to those who frequent them. In any case, however, where substantial relief is called for at all, poorhouses require to be opened for the homeless poor, and habitual mendicants who cannot do ordinary work. Such institutions would have to be continued throughout severe famine for obvious reasons. The time to open these institutions would appear to have arrived when the beggar class begin to congregate in towns, &c., and wanderers, other than beggars, are found going about the district in a reduced condition. The experience of 1873–74 seems to show that during distress in its early stages, places where food can be granted to the lame, blind, halt, and outcast races (like the mussahirs in these districts) require to be established in order to prevent loss of life. A considerable amount of relief was granted thus from what were styled "relief centres" as distinguished from poorhouses. I should generally explain the distinction, I think, by saying that the usual, though not invariable, conditions in case of the former were uncooked food with non-residence, while for the latter they were residence with cooked food. No decent person of any grade would resort to either of these places except under the most extreme compulsion. The chance, therefore, of deception is reduced to a minimum. Amongst the class who do apply physical condition is a simple and safe test. The system has certain advantages as a test and means of gauging the distress. In the event of distress continuing and a complete agency being developed to deal with famine, poorhouses may continue, but relief centres should disappear, or nearly so. Relief works, light labour, and house-to-house visitation should provide for all but the homeless and incapable poor.

The cost of relief centres as well as poorhouses has been in past instances met by contributions from private charity, supplemented by Government funds. Private subscriptions have, however, been so small that virtually it may be said that both kinds are forms of relief granted by the State. I do not know of any practical way of affording relief in case of moderate and temporary distress, other than those mentioned in the present and last answer, whether private charity be taken into account or otherwise.

Mr. Magrath.—Poorhouses should always be opened without a labour test. Where there are a large number of helpless beggars or infirm or sick people they should invariably be supplied with cooked food, and should be encouraged to work at spinning or twine-making or like labour. No person able to do a full day's work should be tolerated for one day, and separation of the sexes should be insisted on.

I do not quite understand the drift of this question, unless it embraces the whole subject of relief generally which I have no time to go into.

Mr. Hodgkinson.—Private charity is generally equal to the task of supporting the poor and infirm, as well as habitual mendicants during the early stages of distress. If the crowd of mendicants to head-quarters is found to be excessive, a poorhouse should be opened, and I do not think better rules can be laid down than those of Colonel Baird Smith in page 140 of Mr. Geddes' "Administrative experience of former famines."

Mr. Toynbee.—Under the circumstances indicated in the first part of the answer to question 6, it would not at first be necessary to open poorhouses at all. If the numbers on the relief works began to increase rapidly: if besides the ordinary non-landed or labouring classes and professional earthworkers, the poorer classes of agriculturists began to come to the works, and if the new arrivals appeared in worse case than those who had come first; if prices continued to rise and markets to tighten, and if professional beggars and the aged and infirm belonging to the poorest classes began to leave their usual haunts and wander about the country, then it would be safe to conclude that private charity had shot its bolt; that the well-to-do classes had begun to fear the pinch of coming pressure, and that their charity had from prudential motives confined itself to the home sphere; then it would be necessary to open poorhouses for such classes and people only as were quite unable to work. To begin gratuitous house-to-house or village relief at this stage would only tend to demoralize the whole population and to interfere with the ordinary domestic industries of the country. At the initial stage of distress, task or piece-work at the ordinary rates for those able and willing to do it, and poorhouses for those who are physically unable, seem to be the only two measures required under the ordinary circumstances and conditions of most districts.

Mr. Finucane.—No poorhouses were opened in my circle. I do not think poorhouses would be at all required in the rural districts of Behar and Bengal as long as famine was kept well in hand. If, owing to want of village inspection, delay in opening relief works, or any other cause, people were allowed in the early stage of famine to become emaciated and unfit for work, it would probably be advisable to keep such persons in poorhouses and have them properly fed and cared for till their physique should have so improved as to render it safe to draft them off to relief works. Temporary sheds might be also required for those social pariahs who, in ordinary times eke out a subsistence by begging from door to door, and who have neither caste-friends to give them aid and protection, nor homes to give them shelter. Persons of this class (known as *kalars* in Behar) are happily very limited in number, but their sufferings are in ordinary years greater (at least in the more remote tracts of Behar) than is generally supposed.

Mr. Henry.—The only persons who should be admitted to relief in a poorhouse without a labour test are—

1*st.*—Aged and infirm adults permanently incapacitated from work.

2*nd.*—Adults suffering from temporary ailments.

3*rd.*—Children.

Whenever an applicant for relief is capable of work a labour test should be exacted from him.

Those whom the State will have to support in times of scarcity can be divided into distinct classes,—

1*st.*—Those who are thrown on relief *for want of work.*

2*nd.*—Those who are thrown on relief because the spring of public charity, which formerly *maintained them in idleness*, has dried up.

These latter are our paupers, habitual non-producers, for whose needs a portion of the store which would be available for producers has to be abstracted. For these paupers only is poorhouse assistance a suitable form of relief. My experience in the famine of 1874 justifies me in stating that assistance given through a poorhouse is considered a degradation, and the recipients tend to become pauperized.

Caste feeling on the subject is not as marked as in former years, but there is a well defined public opinion which pronounces against relief administered through a poorhouse. To the indigent poor who are thrown on State relief temporarily, and whose distress is attributable to causes beyond their own control, our assistance should be given in such a way that their feelings of self-respect and independence are not undermined.

By keeping them in a poorhouse, severed from home and home associations, chronic expectancy, and a dependent spirit are fostered. I cannot write too strongly against this form of charitable relief.

Mr. Kirkwood.—I must except from the general condemnation of poorhouses the circumstances of large towns, where the congregation of habitual beggars, of the blind and halt, and of some homeless poor, incidental to a time of scarcity, may render the opening of such an institution for them, and for them only, desirable.

Baboo Hari Mohan Chandra.—When springs of private charity begin to dry up, relief should be given in poorhouses without a labour test to those only who are incapable of working on labour test. I do not see any other way of giving relief except through private charity.

BOMBAY.

Mr. Hewlett.—If poorhouses are opened at the commencement of a famine, they will be crowded with what I may call the normal poor and infirm persons and mendicants who are found in every village in India. I think to prevent an undue charge being made against the State, that discrimination is required in selecting cases for admission, but where there is a general emigration of the ordinary well-to-do people and the ordinary sources of charity to these people is cut off, then I think a poorhouse must be opened in some central point, to which they could be sent.

General Wilkins.—Poorhouses should be opened to give relief without a labour test only during the height of famine, when the extreme poor and distressed are unable to perform any work whatever.

Mr. Spry.—Poorhouses should only be opened when it appears that private charity cannot meet the occasion; and only those should be admitted who are unable to work, or who are only able to do such work as is given in poorhouses. I do not think that the State should interpose till private charity fails.

Mr. Charles.—Poorhouses should be opened without a test as soon as reports are received of any considerable number of cases of persons being found lying exhausted from disease and travel, by the roadsides and in the temples and dharmsalas.

The experience of the last famine showed by what route the streams of wanderers usually go, and relief houses should be prepared in the same places long before they are opened.

An arrangement for patrolling the chief roads, in order to pick up persons lying exhausted, should be made.

Mr. Ramsay.—When actual famine arrives, I believe poorhouses must be opened for those who cannot work, and who would die if not thus relieved;

CH. II. QN. 7.
—
BOMBAY.

even when aided by Government money, these, I think, can be best supervised either by associations of private persons, or by municipal committees. Both these agencies were used in this district and with complete success. There have always been found native gentlemen of means and leisure willing to aid in this work, which involves finding out the persons in need of aid, and then seeing that the relief is properly distributed. Government need only provide medical officers and medicines, and money of course if available. Government interference is apt to wither up private benevolence. Local committees could be organized in every large town if necessary, and each could have its poorhouse.

Mr. Norman.—When it is found, from an accumulation of beggars in an emaciated condition, and from a careful village inspection, that distress is on the increase, it will then be necessary to open poorhouses at one or two selected places in each *taluka.* There seems to be no other practicable way of affording relief.

Mr. Robertson.—Relief camps or poorhouses must be opened to give relief without a labour test, wherever there are numbers who are destitute, and are unable from old age, sickness, or from weakness from want of nourishment, to perform any work; women far advanced in pregnancy, and weak mothers with sickly infants, must also be admitted.

As far as my experience goes, there are no other practical ways of affording relief at this stage, except through private charity, while that even requires to be placed under control.

Colonel Anderson.—When wandering beggars in a reduced condition begin to appear, evidently suffering from want of food, a poorhouse may be opened, but it should always be a closed house within which those relieved should be interned and some form of work at any rate should be exacted. Besides other reasons this is the only way of preventing relief being obtained there, and from private charity also; thus only can people with friends able to keep them be kept from being thrown on the poorhouse for support.

MADRAS.

MADRAS.

Mr. Price.—At the stage next succeeding that which calls for special works, and which is that when distress has deepened so far that parents are unable to obtain for their wages enough to keep their children from marked emaciation, when the poorer classes find that they cannot support the aged and infirm, when the weakly, owing to reduced food, grow still weaker, and when the artizan, especially the weaver, finds that the demand for his industry is falling off and his earnings becoming in consequence insufficient, and when sickness is increasing, I would take in none but the infirm, aged, the really emaciated, the sick, and children in bad condition. I would exact no labour test, but whenever any one was capable of doing something I would not allow him to remain idle. I know of no practical means of affording relief in other ways than this at this stage of famine. Advances to weavers tend to prevent their falling into idle habits and keep that section of them unable to perform manual labour out of a relief camp; but, on the other hand, this form of relief throws upon the hands of Government at the close of a famine a large quantity of cloth, of which experience has shown that it is very difficult to dispose. Distributing materials for spinning would require a considerable agency, and the same difficulty in disposing of it as occurs in the case of cloths would arise. Mat, basket, and rope making, &c., are professions which are carried on by limited and particular classes, and giving materials for these, which, in many places, would be very hard and expensive to obtain, would not, in my opinion, afford much relief.

Mr. McC. Webster.—Poorhouses should be opened as soon as it is decided to reduce the rate of wages on ordinary works to a famine "wage test." By such time there will be a number of sickly and infirm habitual beggars and others who are not able to work, and these must be provided for. There may also be cases of emaciation, few it is true, but still some, in the villages, and these people should be taken to the relief-houses and brought into a condition for work. I do not think private charity would be of any real use at this stage in affording relief, which should, as above remarked, be afforded by Government, first, by works for those able to work; secondly, by poorhouses for the weak and infirm; and, thirdly, when necessary by money dole for Purdah-nashin women and the sickly and infirm who are unable to leave their villages.

Mr. Martin.—When a famine is at its height, paupers will stray in large numbers into districts that are not suffering from famine, but in which prices are very high. They will especially resort to the larger towns, and will strain private charity beyond what it can bear. It will be necessary to open poorhouses when the condition of these people begins to get precarious.

Poorhouses should not be opened without a labour test.

Mr. Oldham.—It is always easy to open a poorhouse, and also to see when it is wanted, which apparently is not for some months after other needful relief operations are in force. The practical way of affording gratuitous relief is by village home relief. With the system of works near the homes of the distressed in force, and a very restricted home relief, poorhouses in the general sense of the word are not needed at all. Chumpárun, in 1874, was an instance of this. So was Adoni from March till May 1877. A small hospital or infirmary would suffice.

Major Mead.—No one should be allowed to remain in any Government poorhouse (except for a day or two when in the search of work) that is capable of work; those that are should be drafted to works as soon as practicable.

Poorhouses or relief camps should be opened when there are large numbers of wanderers incapable of doing work and evidently suffering from want of food.

Lieutenant-Colonel Hasted.—Poorhouses should not at this stage be opened by Government; private charity will, if organised properly, do what is wanted in large towns, but the organization can only be effected by the collector, vice-president of a muncipality, or other Government officer, to whom the people are in the habit of looking for guidance and assistance. Hospital sheds are at this time wanted, and might be attached to municipal and taluk dispensaries, the charges being met by Government. Deficiency of nourishment quickly induces disease, and the dispensaries cannot provide sufficient accommodation for in-patients.
